AmbiX Configuration

The XrSoundFieldChannelDefinitionAmbixBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundFieldChannelDefinitionAmbixBD {
    XrStructureType                   type;
    const void*                       next;
    XrSoundFieldChannelMaskAmbixBD    channelMask;
} XrSoundFieldChannelDefinitionAmbixBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- channelMask is the channel mask of the sound field.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to using XrSoundFieldChannelDefinitionAmbixBD
- type **must** be XR_TYPE_SOUND_FIELD_CHANNEL_DEFINITION_AMBIX_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- channelMask **must** be a valid XrSoundFieldChannelMaskAmbixBD value

The XrSoundFieldChannelMaskAmbixBD describes the channel mask of an AmbiX sound field.

```
// Provided by XR_BD_spatial_audio_rendering
typedef enum XrSoundFieldChannelMaskAmbixBD {
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_1ST_ORDER_BD = 1,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_2ND_ORDER_BD = 2,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_3RD_ORDER_BD = 3,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_4TH_ORDER_BD = 4,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_5TH_ORDER_BD = 5,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_6TH_ORDER_BD = 6,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_7TH_ORDER_BD = 7,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_MAX_ENUM_BD = 0x7FFFFFFF
} XrSoundFieldChannelMaskAmbixBD;
```

Enumerant Descriptions

- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_1ST_ORDER_BD — Indicates 1st-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_2ND_ORDER_BD — Indicates 2nd-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_3RD_ORDER_BD — Indicates 3rd-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_4TH_ORDER_BD — Indicates 4th-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_5TH_ORDER_BD — Indicates 5th-order-ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_6TH_ORDER_BD — Indicates 6th-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization
- XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_7TH_ORDER_BD — Indicates 7th-order ambisonics in AmbiX format, which uses ACN (Ambisonic Channel Number) channel ordering and SN3D normalization

FuMA Configuration

The XrSoundFieldChannelDefinitionFumaBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundFieldChannelDefinitionFumaBD {
    XrStructureType                 type;
    const void*                     next;
    XrSoundFieldChannelMaskFumaBD   channelMask;
} XrSoundFieldChannelDefinitionFumaBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `channelMask` is the channel mask of the sound field.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundFieldChannelDefinitionFumaBD
- `type` **must** be `XR_TYPE_SOUND_FIELD_CHANNEL_DEFINITION_FUMA_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `channelMask` **must** be a valid XrSoundFieldChannelMaskFumaBD value

The XrSoundFieldChannelMaskFumaBD describes the channel mask of a FuMA sound field.

```
// Provided by XR_BD_spatial_audio_rendering
typedef enum XrSoundFieldChannelMaskFumaBD {
    XR_SOUND_FIELD_CHANNEL_MASK_FUMA_1ST_ORDER_BD = 1,
    XR_SOUND_FIELD_CHANNEL_MASK_FUMA_MAX_ENUM_BD = 0x7FFFFFFF
} XrSoundFieldChannelMaskFumaBD;
```

Enumerant Descriptions

- `XR_SOUND_FIELD_CHANNEL_MASK_FUMA_1ST_ORDER_BD` — Indicates the 1st-order ambisonic in FuMA format, which refers to Furse-Malham channel order and maxN normalization

Update Sound Field Config

The xrUpdateSoundFieldConfigBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrUpdateSoundFieldConfigBD(
    XrSoundFieldBD                              soundField,
    const XrSoundFieldConfigBD*                 config,
    XrSoundFieldFlagsBD                         flags);
```

Parameter Descriptions

- `soundField` is the XrSoundFieldBD to be updated.
- `config` is the XrSoundFieldConfigBD that defines the configuration of the sound field.
- `flags` is the bit mask (bitwise `OR` of XrSoundFieldFlagsBD) of the sound field configuration to change.

When updating the configuration of a submitted sound field, applications set `flags` to specify which properties to update. The runtime **must** not update a property if the corresponding flag bit is not set. The runtime **must** not read the parameters of XrSoundFieldConfigBD if the corresponding bits are not set; this means that the application **may** pass invalid or uninitialized fields for parameters it does not intend to update.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrUpdateSoundFieldConfigBD
- `soundField` **must** be a valid XrSoundFieldBD handle
- If `config` is not `NULL`, `config` **must** be a pointer to a valid XrSoundFieldConfigBD structure
- `flags` **must** be a valid combination of XrSoundFieldFlagBitsBD values
- `flags` **must** not be `0`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_BD_spatial_audio_rendering
typedef XrFlags64 XrSoundFieldFlagsBD;
```

```
// Provided by XR_BD_spatial_audio_rendering
// Flag bits for XrSoundFieldFlagsBD
static const XrSoundFieldFlagsBD XR_SOUND_FIELD_ENABLED_BIT_BD = 0x00000001;
static const XrSoundFieldFlagsBD XR_SOUND_FIELD_ORIENTATION_BIT_BD = 0x00000002;
static const XrSoundFieldFlagsBD XR_SOUND_FIELD_MAIN_VOLUME_BIT_BD = 0x00000004;
static const XrSoundFieldFlagsBD XR_SOUND_FIELD_LFE_GAIN_BIT_BD = 0x00000008;
```

Flag Descriptions

- XR_SOUND_FIELD_ENABLED_BIT_BD — to indicate an update of XrSoundFieldConfigBD::enabled
- XR_SOUND_FIELD_ORIENTATION_BIT_BD — to indicate an update of XrSoundFieldConfigBD::pose and/or XrSoundFieldConfigBD::baseSpace
- XR_SOUND_FIELD_MAIN_VOLUME_BIT_BD — to indicate an update of XrSoundFieldConfigBD::mainVolume
- XR_SOUND_FIELD_LFE_GAIN_BIT_BD — to indicate an update of XrSoundFieldConfigBD::lfeGain

Destroy Sound Field

The xrDestroySoundFieldBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrDestroySoundFieldBD(
    XrSoundFieldBD                              soundField);
```

Parameter Descriptions

- `soundField` is the handle of the sound field to be removed.

When an application removes a sound field with xrDestroySoundFieldBD, its corresponding sound is not rendered anymore.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrDestroySoundFieldBD
- `soundField` **must** be a valid XrSoundFieldBD handle

Thread Safety

- Access to `soundField`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

Create Sound Objects

```
// Provided by XR_BD_spatial_audio_rendering
XR_DEFINE_HANDLE(XrSoundObjectBD)
```

An XrSoundObjectBD handle represents a sound object.

The xrCreateSoundObjectBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrCreateSoundObjectBD(
    XrSpatialAudioRendererBD                    renderer,
    const XrSoundObjectConfigBD*                config,
    XrSoundObjectBD*                            soundObject);
```

Parameter Descriptions

- `renderer` is the XrSpatialAudioRendererBD used for spatial audio rendering.
- `config` is the XrSoundObjectConfigBD that defines the configuration of the sound object.
- `soundObject` is a pointer to a handle in which the xrCreateSoundObjectBD returns

Applications add a sound object to the sound scene rendered by the spatial audio renderer with this function.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrCreateSoundObjectBD
- `renderer` **must** be a valid XrSpatialAudioRendererBD handle
- `config` **must** be a pointer to a valid XrSoundObjectConfigBD structure
- `soundObject` **must** be a pointer to an XrSoundObjectBD handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSoundObjectConfigBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObjectConfigBD {
    XrStructureType                                 type;
    const void*                                     next;
    XrBool32                                        enabled;
    XrPosef                                         pose;
    XrSpace                                         baseSpace;
    float                                           mainVolume;
    float                                           reflectionGain;
    XrBool32                                        enableDoppler;
    const XrSoundObjectDistanceAttenuationBD*       directSoundAttenuation;
    const XrSoundObjectDistanceAttenuationBD*       indirectSoundAttenuation;
} XrSoundObjectConfigBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `enabled` is an `XrBool32`, indicating whether the sound object is enabled.
- `pose` is an XrPosef of the sound object.
- `baseSpace` is an XrSpace which the `pose` is defined in.
- `mainVolume` is the main volume of the sound object. It acts as a linear gain attenuation of the input signal in the range (0, 1).
- `reflectionGain` is the reflection gain of the sound object. It acts as a linear gain attenuation of the input signal in the range (0, 1) on top of the main volume.
- `enableDoppler` is an `XrBool32`, indicating whether the Doppler effect is enabled.
- `directSoundAttenuation` is the XrSoundObjectDistanceAttenuationBD of the direct sound of the sound object, propagating along a straight line from the source to the listener.
- `indirectSoundAttenuation` is the XrSoundObjectDistanceAttenuationBD of the indirect sound of the sound object, which is any other propagation that is not considered "direct."

Applications **may** specify the directivity and/or the shape of a sound object:

- To describe the sound object's shape, applications chain XrSoundObjectShapeSphereBD to XrSoundObjectConfigBD::`next`
- To describe the directivity of a sound object by a cardioid polar pattern, applications chain XrSoundObjectDirectivityCardioidBD to XrSoundObjectConfigBD::`next`.

If the application does not chain XrSoundObjectShapeSphereBD, the sound object is defined as an infinitesimally small point. If the application does not change XrSoundObjectDirectivityCardioidBD, the sound object is defined to be omnidirectional (uniform sound emission intensity over all directions).

The behavior below specifies how the runtime renders audio when tracking quality changes for the `baseSpace`.

- While the `baseSpace` pose is valid, but not tracked (i.e. xrLocateSpace reports its location with `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` set, but not `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` and `XR_VIEW_STATE_POSITION_TRACKED_BIT`), the runtime **must** keep rendering the sound object using the most recent valid pose of that space.
- While the `baseSpace` pose is neither valid nor tracked (i.e. xrLocateSpace reports its location with `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` unset), the runtime **should** keep rendering the sound object using the most recent valid pose of that space relative to its parent.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to using XrSoundObjectConfigBD
- type **must** be XR_TYPE_SOUND_OBJECT_CONFIG_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrSoundObjectDirectivityCardioidBD, XrSoundObjectShapeSphereBD
- baseSpace **must** be a valid XrSpace handle
- directSoundAttenuation **must** be a pointer to a valid XrSoundObjectDistanceAttenuationBD structure
- indirectSoundAttenuation **must** be a pointer to a valid XrSoundObjectDistanceAttenuationBD structure

The XrSoundObjectDistanceAttenuationBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObjectDistanceAttenuationBD {
    XrStructureType                              type;
    const void*                                  next;
    XrSoundObjectDistanceAttenuationTypeBD       distanceAttenuationType;
    float                                        minAttenuationRange;
    float                                        maxAttenuationRange;
    float                                        referenceDistance;
    float                                        rolloffFactor;
    XrSoundObjectDistanceAttenuationCurveBD*     customDistanceAttenuationCurve;
} XrSoundObjectDistanceAttenuationBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `distanceAttenuationType` is the type of this distance attenuation.
- `minAttenuationRange` is the minimum distance of attenuation in meters. Any distance closer than this value will not cause less attenuation.
- `maxAttenuationRange` is the maximum distance of attenuation in meters. Any distance further than this value will not cause more attenuation.
- `referenceDistance` is the propagation distance in which sound is neither attenuated nor gained. It is ignored if `distanceAttenuationType` is not `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_ROLLOFF_BD`.
- `rolloffFactor` is the intensity of distance attenuation, which **must** be larger or equal to 0. It is ignored if `distanceAttenuationType` is not `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_ROLLOFF_BD`.
- `customDistanceAttenuationCurve` is a pointer to an XrSoundObjectDistanceAttenuationCurveBD structure defining an attenuation curve for a customized distance attenuation. It is ignored if `distanceAttenuationType` is not `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_CUSTOMIZED_BD`

When `distanceAttenuationType` is `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_NONE_BD`, the runtime **must** not apply attenuation based on sound propagation distance, which means: attenuation(distance) = 1

When `distanceAttenuationType` is `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_INVERSE_SQUARE_BD`, the runtime **must** use the following formulas to calculate the distance attenuation:

- attenuation(d) = 1, $d < r_{min}$
- attenuation(d) = $1/\sqrt{(1 + (r_{max} - r_{min})^2)}$, $d > r_{max}$
- attenuation(d) = $1/\sqrt{(1 + (d - r_{min})^2)}$, otherwise

where:

- d is the propagation distance of sound.
- r_{min} is `minAttenuationRange`.
- r_{max} is `maxAttenuationRange`.

When `distanceAttenuationType` is `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_ROLLOFF_BD`, the runtime **must** use the following formulas to calculate the distance attenuation:

- attenuation(d) = $(r_{min}/d_{ref})^{\rho}$, $d < r_{min}$
- attenuation(d) = $(r_{max}/d_{ref})^{\rho}$, $d > r_{max}$
- attenuation(d) = $(d/d_{ref})^{\rho}$, otherwise

where:

- d is the propagation distance of sound.
- r_{min} is `minAttenuationRange`.
- r_{max} is `maxAttenuationRange`.
- d_{ref} is `referenceDistance`.
- ρ is `rolloffFactor`.

When `distanceAttenuationType` is `XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_CUSTOMIZED_BD`, the application **must** set `customDistanceAttenuationCurve` to an XrSoundObjectDistanceAttenuationCurveBD structure defining the distance attenuation curve function to calculate the distance attenuation.

If `minAttenuationRange` is greater than `maxAttenuationRange`, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundObjectDistanceAttenuationBD
- `type` **must** be `XR_TYPE_SOUND_OBJECT_DISTANCE_ATTENUATION_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `distanceAttenuationType` **must** be a valid XrSoundObjectDistanceAttenuationTypeBD value
- If `customDistanceAttenuationCurve` is not `NULL`, `customDistanceAttenuationCurve` **must** be a pointer to an XrSoundObjectDistanceAttenuationCurveBD structure

The XrSoundObjectDistanceAttenuationTypeBD enumeration describes the type of distance attenuation.

```
// Provided by XR_BD_spatial_audio_rendering
typedef enum XrSoundObjectDistanceAttenuationTypeBD {
    XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_NONE_BD = 0,
    XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_INVERSE_SQUARE_BD = 1,
    XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_ROLLOFF_BD = 2,
    XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_CUSTOMIZED_BD = 100,
    XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_MAX_ENUM_BD = 0x7FFFFFFF
} XrSoundObjectDistanceAttenuationTypeBD;
```

Enumerant Descriptions

- XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_NONE_BD — Indicates that no attenuation is applied when source-listener distance varies.
- XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_INVERSE_SQUARE_BD — Indicates that attenuation scales proportional to the inverse-squared distance of source-listener distance.
- XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_ROLLOFF_BD — Indicates that attenuation equals pow(distance/refer_distance, -rolloff_factor), in which distance is clamped by minAttenuationRange and maxAttenuationRange.
- XR_SOUND_OBJECT_DISTANCE_ATTENUATION_TYPE_CUSTOMIZED_BD — Indicates that the distance attenuation is customized.

The XrSoundObjectDistanceAttenuationCurveBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObjectDistanceAttenuationCurveBD {
    XrStructureType               type;
    const void*                   next;
    uint32_t                      curvePointCount;
    XrAttenuationCurvePointBD*    curvePoints;
} XrSoundObjectDistanceAttenuationCurveBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- curvePointCount is the number of points in the curve.
- curvePoints is a pointer to an array of XrAttenuationCurvePointBD.

If the propagation distance falls between two points in the curve, the runtime **must** calculate attenuation by linear interpolation.

If the propagation distance is less than the first point in the curve, the runtime **must** use the attenuation of the first point.

If the propagation distance is greater than the last point in the curve, the runtime **must** use the attenuation of the last point.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to using XrSoundObjectDistanceAttenuationCurveBD
- type **must** be XR_TYPE_SOUND_OBJECT_DISTANCE_ATTENUATION_CURVE_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- curvePoints **must** be a pointer to an array of curvePointCount XrAttenuationCurvePointBD structures
- The curvePointCount parameter **must** be greater than 0

The XrAttenuationCurvePointBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrAttenuationCurvePointBD {
    float    distance;
    float    gain;
} XrAttenuationCurvePointBD;
```

Member Descriptions

- distance is the propagation distance of the sound wave.
- gain is the linear attenuation gain within the range of (0, 1), where 0 means complete attenuation (silence) and 1 means no attenuation.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to using XrAttenuationCurvePointBD

The XrSoundObjectShapeSphereBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObjectShapeSphereBD {
    XrStructureType    type;
    const void*        next;
    float              radius;
} XrSoundObjectShapeSphereBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `radius` is the radius of the sphere in meters.

To describe the sound object's shape as defined by a sphere, applications **may** chain XrSoundObjectShapeSphereBD to the XrSoundObjectConfigBD::`next` chain.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundObjectShapeSphereBD
- `type` **must** be `XR_TYPE_SOUND_OBJECT_SHAPE_SPHERE_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSoundObjectDirectivityCardioidBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObjectDirectivityCardioidBD {
    XrStructureType    type;
    const void*        next;
    float              alpha;
    float              order;
} XrSoundObjectDirectivityCardioidBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `alpha` describes the shape of the cardioid polar pattern.
- `order` is the sharpness of the cardioid polar pattern.

To describe the directivity of a sound object by a cardioid polar pattern, applications **may** chain XrSoundObjectDirectivityCardioidBD to the XrSoundObjectConfigBD::`next` chain.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundObjectDirectivityCardioidBD
- `type` **must** be `XR_TYPE_SOUND_OBJECT_DIRECTIVITY_CARDIOID_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Update Sound Object Config

The xrUpdateSoundObjectConfigBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrUpdateSoundObjectConfigBD(
    XrSoundObjectBD                             soundObject,
    const XrSoundObjectConfigBD*                config,
    XrSoundObjectFlagsBD                        flags);
```

Parameter Descriptions

- `soundObject` is the XrSoundObjectBD
- `config` is the XrSoundObjectConfigBD that defines the configuration of the sound object.
- `flags` is the bit mask (bitwise `OR` of XrSoundObjectFlagsBD) of the sound object properties to change.

When updating the configuration of a submitted sound field, applications use `flags` to specify which properties to update. The runtime **must** not update a property if the corresponding flag bit is not set. The runtime **must** not read the parameters of XrSoundObjectConfigBD if the corresponding bits are not set, this means that the application **may** pass invalid or uninitialized fields for parameters it does not intend to update.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrUpdateSoundObjectConfigBD
- `soundObject` **must** be a valid XrSoundObjectBD handle
- `config` **must** be a pointer to a valid XrSoundObjectConfigBD structure
- `flags` **must** be a valid combination of XrSoundObjectFlagBitsBD values
- `flags` **must** not be `0`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_BD_spatial_audio_rendering
typedef XrFlags64 XrSoundObjectFlagsBD;
```

```
// Provided by XR_BD_spatial_audio_rendering
// Flag bits for XrSoundObjectFlagsBD
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_ENABLED_BIT_BD = 0x00000001;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_POSE_BIT_BD = 0x00000002;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_DIRECTIVITY_BIT_BD = 0x00000004;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_SHAPE_BIT_BD = 0x00000008;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_MAIN_VOLUME_BIT_BD = 0x00000010;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_REFLECTION_GAIN_BIT_BD = 0x00000020;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_ENABLE_DOPPLER_BIT_BD = 0x00000040;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_DIRECT_SOUND_ATTENUATION_BIT_BD =
0x00000080;
static const XrSoundObjectFlagsBD XR_SOUND_OBJECT_INDIRECT_SOUND_ATTENUATION_BIT_BD =
0x00000100;
```

The flag bits have the following meanings:

Flag Descriptions

- XR_SOUND_OBJECT_ENABLED_BIT_BD — to indicate an update of XrSoundObjectConfigBD::enabled
- XR_SOUND_OBJECT_POSE_BIT_BD — to indicate an update of XrSoundObjectConfigBD::pose
- XR_SOUND_OBJECT_DIRECTIVITY_BIT_BD — to indicate an update of the directivity using an XrSoundObjectDirectivityCardioidBD chained to XrSoundObjectConfigBD::next
- XR_SOUND_OBJECT_SHAPE_BIT_BD — to indicate an update of the shape using an XrSoundObjectShapeSphereBD chained to XrSoundObjectConfigBD::next
- XR_SOUND_OBJECT_MAIN_VOLUME_BIT_BD — to indicate an update of XrSoundObjectConfigBD::mainVolume
- XR_SOUND_OBJECT_REFLECTION_GAIN_BIT_BD — to indicate an update of XrSoundObjectConfigBD::reflectionGain
- XR_SOUND_OBJECT_ENABLE_DOPPLER_BIT_BD — to indicate an update of XrSoundObjectConfigBD::enableDoppler
- XR_SOUND_OBJECT_DIRECT_SOUND_ATTENUATION_BIT_BD — to indicate an update of XrSoundObjectConfigBD::directSoundAttenuation
- XR_SOUND_OBJECT_INDIRECT_SOUND_ATTENUATION_BIT_BD — to indicate an update of XrSoundObjectConfigBD::indirectSoundAttenuation

Destroy Sound Object

The xrDestroySoundObjectBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrDestroySoundObjectBD(
    XrSoundObjectBD                             soundObject);
```

Parameter Descriptions

- soundObject is the XrSoundObjectBD to be destroyed.

When an application removes a sound object with xrDestroySoundObjectBD, its corresponding sound is not rendered anymore.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrDestroySoundObjectBD
- `soundObject` **must** be a valid XrSoundObjectBD handle

Thread Safety

- Access to `soundObject`, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Add Sound Obstacles to the Scene

Applications **may** create sound obstacles in the scene that simulate real-world or virtual objects that reflect or diffract sound, such as doors, walls, carpets, etc.

```
// Provided by XR_BD_spatial_audio_rendering
XR_DEFINE_HANDLE(XrSoundObstacleMaterialBD)
```

The XrSoundObstacleMaterialBD handle represents a sound obstacle material.

The xrCreateSoundObstacleMaterialBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrCreateSoundObstacleMaterialBD(
    XrSpatialAudioRendererBD                renderer,
    const XrSoundObstacleMaterialConfigBD*  config,
    XrSoundObstacleMaterialBD*              material);
```

Parameter Descriptions

- `renderer` is the XrSpatialAudioRendererBD handle that the sound obstacle material is created for.
- `config` is the XrSoundObstacleMaterialBD that defines the configuration of the sound obstacle material.
- `material` is a pointer to XrSoundObstacleMaterialBD that xrCreateSoundObstacleMaterialBD returned.

A valid XrSoundObstacleMaterialBD handle **can** be used to configure the material properties of the sound obstacle when creating or updating a sound obstacle.

Note that a successful creation of an XrSoundObstacleMaterialBD on its own does not affect the virtual sound propagation, until the created XrSoundObstacleMaterialBD is used to create or update sound obstacles using xrCreateSoundObstacleBD or xrUpdateSoundObstacleConfigBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrCreateSoundObstacleMaterialBD
- `renderer` **must** be a valid XrSpatialAudioRendererBD handle
- `config` **must** be a pointer to a valid XrSoundObstacleMaterialConfigBD structure
- `material` **must** be a pointer to an XrSoundObstacleMaterialBD handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSoundObstacleMaterialConfigBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObstacleMaterialConfigBD {
    XrStructureType                 type;
    const void*                     next;
    XrSoundObstacleMaterialTypeBD   materialType;
    uint32_t                        bandCount;
    float*                          bandFrequencies;
    float*                          bandAbsorptions;
    float*                          bandScatterings;
    float*                          bandTransmissions;
} XrSoundObstacleMaterialConfigBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `materialType` is the XrSoundObstacleMaterialTypeBD of sound obstacle.
- `bandCount` is the number of bands for which frequencies, absorptions, scatterings, and transmissions are defined below. This field and its associated arrays in subsequent fields are ignored if `materialType` is not `XR_SOUND_OBSTACLE_MATERIAL_TYPE_CUSTOM_BD`.
- `bandFrequencies` is an array of `bandCount` frequency centers of the frequency bands for custom materials.
- `bandAbsorptions` is an array of `bandCount` absorption values: the ratio of absorbed sound energy of the sound obstacle when a reflection happens, in the range (0, 1) for custom materials.
- `bandScatterings` is an array of `bandCount` scattering values: the ratio of scattered sound energy of the sound obstacle when a reflection happens, in the range (0, 1) for custom materials.
- `bandTransmissions` is an array of `bandCount` transmission values: the ratio of transmitted sound energy of the sound obstacle when a reflection happens, in the range (0, 1) for custom materials.

Applications use XrSoundObstacleMaterialConfigBD to configure the material properties of an XrSoundObstacleMaterialBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundObstacleMaterialConfigBD
- `type` **must** be `XR_TYPE_SOUND_OBSTACLE_MATERIAL_CONFIG_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `materialType` **must** be a valid XrSoundObstacleMaterialTypeBD value
- `bandFrequencies` **must** be a pointer to an array of `bandCount` `float` values
- `bandAbsorptions` **must** be a pointer to an array of `bandCount` `float` values
- `bandScatterings` **must** be a pointer to an array of `bandCount` `float` values
- `bandTransmissions` **must** be a pointer to an array of `bandCount` `float` values
- The `bandCount` parameter **must** be greater than `0`

The XrSoundObstacleMaterialTypeBD enumeration describes the sound obstacle material type.

```
// Provided by XR_BD_spatial_audio_rendering
typedef enum XrSoundObstacleMaterialTypeBD {
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_ACOUSTIC_TILE_BD = 0,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_BRICK_BD = 1,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_BRICK_PAINTED_BD = 2,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_BD = 3,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_HEAVY_BD = 4,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_HEAVY_PADDED_BD = 5,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CERAMIC_TILE_BD = 6,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BD = 7,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_ROUGH_BD = 8,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BLOCK_BD = 9,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BLOCK_PAINTED_BD = 10,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CURTAIN_BD = 11,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_FOLIAGE_BD = 12,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_GLASS_BD = 13,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_GLASS_HEAVY_BD = 14,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_GRASS_BD = 15,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_GRAVEL_BD = 16,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_GYPSUM_BOARD_BD = 17,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_PLASTER_ON_BRICK_BD = 18,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_PLASTER_ON_CONCRETE_BLOCK_BD = 19,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_SOIL_BD = 20,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_SOUND_PROOF_BD = 21,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_SNOW_BD = 22,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_STEEL_BD = 23,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_WATER_BD = 24,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_THIN_BD = 25,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_THICK_BD = 26,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_FLOOR_BD = 27,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_ON_CONCRETE_BD = 28,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_CUSTOM_BD = 29,
    XR_SOUND_OBSTACLE_MATERIAL_TYPE_MAX_ENUM_BD = 0x7FFFFFFF
} XrSoundObstacleMaterialTypeBD;
```

Enum	Description
XR_SOUND_OBSTACLE_MATERIAL_TYPE_ACOUSTIC_TILE_BD	indicates that the material is acoustic tile
XR_SOUND_OBSTACLE_MATERIAL_TYPE_BRICK_BD	indicates that the material resembles brick
XR_SOUND_OBSTACLE_MATERIAL_TYPE_BRICK_PAINTED_BD	indicates that the material resembles painted brick
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_BD	indicates that the material resembles carpet
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_HEAVY_BD	indicates that the material resembles heavy carpet

Enum	Description
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CARPET_HEAVY_PADDED_BD	indicates that the material resembles heavily padded carpet
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CERAMIC_TILE_BD	indicates that the material resembles ceramic tile
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BD	indicates that the material resembles concrete
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_ROUGH_BD	indicates that the material resembles rough concrete
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BLOCK_BD	indicates that the material resembles concrete block
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CONCRETE_BLOCK_PAINTED_BD	indicates that the material resembles painted concrete block
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CURTAIN_BD	indicates that the material resembles curtain
XR_SOUND_OBSTACLE_MATERIAL_TYPE_FOLIAGE_BD	indicates that the material resembles foliage
XR_SOUND_OBSTACLE_MATERIAL_TYPE_GLASS_BD	indicates that the material resembles glass
XR_SOUND_OBSTACLE_MATERIAL_TYPE_GLASS_HEAVY_BD	indicates that the material resembles heavy glass
XR_SOUND_OBSTACLE_MATERIAL_TYPE_GRASS_BD	indicates that the material resembles grass
XR_SOUND_OBSTACLE_MATERIAL_TYPE_GRAVEL_BD	indicates that the material resembles gravel
XR_SOUND_OBSTACLE_MATERIAL_TYPE_GYPSUM_BOARD_BD	indicates that the material resembles gypsum board
XR_SOUND_OBSTACLE_MATERIAL_TYPE_PLASTER_ON_BRICK_BD	indicates that the material resembles plaster on brick
XR_SOUND_OBSTACLE_MATERIAL_TYPE_PLASTER_ON_CONCRETE_BLOCK_BD	indicates that the material resembles plaster on concrete block
XR_SOUND_OBSTACLE_MATERIAL_TYPE_SOIL_BD	indicates that the material resembles soil
XR_SOUND_OBSTACLE_MATERIAL_TYPE_SOUND_PROOF_BD	indicates that the material resembles sound proof
XR_SOUND_OBSTACLE_MATERIAL_TYPE_SNOW_BD	indicates that the material resembles snow
XR_SOUND_OBSTACLE_MATERIAL_TYPE_STEEL_BD	indicates that the material resembles steel
XR_SOUND_OBSTACLE_MATERIAL_TYPE_WATER_BD	indicates that the material resembles water
XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_THIN_BD	indicates that the material resembles thin wood
XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_THICK_BD	indicates that the material resembles thick wood
XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_FLOOR_BD	indicates that the material resembles floor
XR_SOUND_OBSTACLE_MATERIAL_TYPE_WOOD_ON_CONCRETE_BD	indicates that the material resembles wood on concrete

Enum	Description
XR_SOUND_OBSTACLE_MATERIAL_TYPE_CUSTOM_BD	Customized material described by detailed acoustic surface parameters, for example, absorption, scattering, and transmission.

The xrUpdateSoundObstacleMaterialConfigBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrUpdateSoundObstacleMaterialConfigBD(
    XrSoundObstacleMaterialBD                   material,
    const XrSoundObstacleMaterialConfigBD*      config);
```

Parameter Descriptions

- `material` is the XrSoundObstacleMaterialBD to be updated.
- `config` is the XrSoundObstacleMaterialBD that defines the configuration of the sound obstacle material.

This function **can** be used to update the configuration of a created XrSoundObstacleMaterialBD.

Note that a successful update of an XrSoundObstacleMaterialBD on its own does not affect the virtual sound propagation, until the updated XrSoundObstacleMaterialBD is used to create or update sound obstacles using xrCreateSoundObstacleBD or xrUpdateSoundObstacleConfigBD. This is true even if XrSoundObstacleMaterialBD was referenced by an active sound obstacle.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrUpdateSoundObstacleMaterialConfigBD
- `material` **must** be a valid XrSoundObstacleMaterialBD handle
- `config` **must** be a pointer to a valid XrSoundObstacleMaterialConfigBD structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroySoundObstacleMaterialBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrDestroySoundObstacleMaterialBD(
    XrSoundObstacleMaterialBD                   material);
```

Parameter Descriptions

- material is the XrSoundObstacleMaterialBD to be destroyed.

This function **can** be used to destroy an existing XrSoundObstacleMaterialBD.

Note that destroying an XrSoundObstacleMaterialBD does not affect the virtual sound propagation, even if it was referenced by an active sound obstacle.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrDestroySoundObstacleMaterialBD
- material **must** be a valid XrSoundObstacleMaterialBD handle

Thread Safety

- Access to `material`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

```
// Provided by XR_BD_spatial_audio_rendering
XR_DEFINE_HANDLE(XrSoundObstacleBD)
```

The XrSoundObstacleBD handle represents a sound obstacle.

Sound obstacles in the environment are represented by XrSoundObstacleBD handles, and each XrSoundObstacleBD has material properties affecting sound reflection and diffraction characteristics.

The runtime **must** calculate and render sound according to all the sound fields, sound objects, and sound obstacles in the scene.

The xrCreateSoundObstacleBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrCreateSoundObstacleBD(
    XrSpatialAudioRendererBD                    renderer,
    const XrSoundObstacleConfigBD*              config,
    const XrSoundTriangleMeshBD*                mesh,
    XrSoundObstacleBD*                          soundObstacle);
```

Parameter Descriptions

- `renderer` is the XrSpatialAudioRendererBD used for spatial audio rendering.
- `config` is the XrSoundObstacleConfigBD that defines the configuration of the sound obstacle, including pose and material information.
- `mesh` is the XrSoundTriangleMeshBD that defines the shape of the sound obstacle.
- `soundObstacle` is a pointer to XrSoundObstacleBD that xrCreateSoundObstacleBD returned.

When an application creates a sound obstacle in the spatial audio renderer, virtual sound propagation is influenced by this acoustic mesh.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrCreateSoundObstacleBD
- `renderer` **must** be a valid XrSpatialAudioRendererBD handle
- `config` **must** be a pointer to a valid XrSoundObstacleConfigBD structure
- `mesh` **must** be a pointer to a valid XrSoundTriangleMeshBD structure
- `soundObstacle` **must** be a pointer to an XrSoundObstacleBD handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSoundObstacleConfigBD structure is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundObstacleConfigBD {
    XrStructureType               type;
    const void*                   next;
    XrBool32                      enabled;
    XrPosef                       pose;
    XrSpace                       baseSpace;
    uint32_t                      materialCount;
    XrSoundObstacleMaterialBD*    materials;
} XrSoundObstacleConfigBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `enabled` is an `XrBool32`, indicating whether the sound obstacle is enabled.
- `pose` is an XrPosef of the acoustic mesh.
- `baseSpace` is an XrSpace which the `pose` is defined in.
- `materialCount` is the number of materials in the `materials` array.
- `materials` is an array of `materialCount` XrSoundObstacleMaterialBD that defines the material properties for each vertex of the sound obstacle.

Applications use XrSoundObstacleConfigBD to configure an XrSoundObstacleBD.

If this config is used to create an XrSoundObstacleBD, `materialCount` **must** be equal to the associated XrSoundTriangleMeshBD::`vertexCount`, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If this config is used to update both shape and materials of an existing XrSoundObstacleBD, `materialCount` **must** be equal to the associated XrSoundTriangleMeshBD::`vertexCount`, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If this config is used to update only materials of an existing XrSoundObstacleBD, `materialCount` **must** be equal to the vertices count of this XrSoundTriangleMeshBD, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The runtime **must** not use the sound obstacle for sound calculations if `enabled` is set to `XR_FALSE`.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundObstacleConfigBD
- `type` **must** be `XR_TYPE_SOUND_OBSTACLE_CONFIG_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle
- `materials` **must** be a pointer to an array of `materialCount` XrSoundObstacleMaterialBD handles
- The `materialCount` parameter **must** be greater than `0`

The XrSoundTriangleMeshBD structure is described as:

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrSoundTriangleMeshBD {
    XrStructureType    type;
    const void*        next;
    uint32_t           vertexCount;
    XrVector3f*        vertices;
    uint32_t           indexCount;
    uint32_t*          indices;
} XrSoundTriangleMeshBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCount` is the number of vertices in the triangle mesh.
- `vertices` is a pointer to an array of XrVector3f vertices.
- `indexCount` is the number of indices in the triangle mesh.
- `indices` is a pointer to an array of indices that defines the triangles.

The XrSoundTriangleMeshBD structure describes the shape of a sound obstacle. The `vertices` are in counter-clockwise order as viewed from the user perspective. Only the front faces are considered when rendering the sound. The `indices` array defines the topology of the triangle mesh. Each triplet of consecutive elements points to three vertices in the vertices array and thus form a triangle.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrSoundTriangleMeshBD
- `type` **must** be `XR_TYPE_SOUND_TRIANGLE_MESH_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `vertices` **must** be a pointer to an array of `vertexCount` XrVector3f structures
- `indices` **must** be a pointer to an array of `indexCount` `uint32_t` values
- The `vertexCount` parameter **must** be greater than `0`
- The `indexCount` parameter **must** be greater than `0`

Update Sound Obstacle Config

The xrUpdateSoundObstacleConfigBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrUpdateSoundObstacleConfigBD(
    XrSoundObstacleBD                           soundObstacle,
    const XrSoundObstacleConfigBD*              config,
    const XrSoundTriangleMeshBD*                mesh,
    XrSoundObstacleFlagsBD                      flags);
```

Parameter Descriptions

- `soundObstacle` is the XrSoundObstacleBD to be updated.
- `config` is the XrSoundObstacleConfigBD that defines the configuration of the sound obstacle, including pose and material information.
- `mesh` is the XrSoundTriangleMeshBD that describes the shape of the sound obstacle.
- `flags` is the bit mask (bitwise `OR` of XrSoundObstacleFlagsBD) of the sound obstacle properties to change, including pose and material information.

When updating the configuration of a submitted sound obstacle, applications use `flags` to specify which properties to update. The runtime **must** not update a property if the corresponding flag bit is not set. The runtime **must** not read the parameters of XrSoundObstacleConfigBD if the corresponding bits are not set; this means that the application **may** pass invalid or uninitialized fields for parameters it does not intend to update.

If `XR_SOUND_OBSTACLE_MESH_BIT_BD` is set in `flags`, `mesh` **must** not be `NULL`, otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If any other bit is set, `config` **must** not be `NULL`, otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrUpdateSoundObstacleConfigBD
- soundObstacle **must** be a valid XrSoundObstacleBD handle
- If config is not NULL, config **must** be a pointer to a valid XrSoundObstacleConfigBD structure
- If mesh is not NULL, mesh **must** be a pointer to a valid XrSoundTriangleMeshBD structure
- flags **must** be a valid combination of XrSoundObstacleFlagBitsBD values
- flags **must** not be 0

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_BD_spatial_audio_rendering
typedef XrFlags64 XrSoundObstacleFlagsBD;
```

```
// Provided by XR_BD_spatial_audio_rendering
// Flag bits for XrSoundObstacleFlagsBD
static const XrSoundObstacleFlagsBD XR_SOUND_OBSTACLE_ENABLED_BIT_BD = 0x00000001;
static const XrSoundObstacleFlagsBD XR_SOUND_OBSTACLE_POSE_BIT_BD = 0x00000002;
static const XrSoundObstacleFlagsBD XR_SOUND_OBSTACLE_MESH_BIT_BD = 0x00000004;
static const XrSoundObstacleFlagsBD XR_SOUND_OBSTACLE_MATERIALS_BIT_BD = 0x00000008;
```

The flag bits have the following meanings:

Flag Descriptions

- XR_SOUND_OBSTACLE_ENABLED_BIT_BD — to indicate an update of XrSoundObstacleConfigBD::enabled
- XR_SOUND_OBSTACLE_POSE_BIT_BD — to indicate an update of XrSoundObstacleConfigBD::pose
- XR_SOUND_OBSTACLE_MESH_BIT_BD — to indicate an update of XrSoundObstacleConfigBD::mesh
- XR_SOUND_OBSTACLE_MATERIALS_BIT_BD — to indicate an update of XrSoundObstacleConfigBD::materials

The xrDestroySoundObstacleBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrDestroySoundObstacleBD(
    XrSoundObstacleBD                           soundObstacle);
```

Parameter Descriptions

- soundObstacle is the XrSoundObstacleBD to be removed.

Applications use this function to remove a submitted sound obstacle.

To temporarily disable an obstacle, set the respective XrSoundObstacleConfigBD::enabled to XR_FALSE instead with a call to xrUpdateSoundObstacleConfigBD.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrDestroySoundObstacleBD
- soundObstacle **must** be a valid XrSoundObstacleBD handle

Thread Safety

- Access to soundObstacle, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

12.88.5. Submit Audio Buffer

Applications **should** submit an audio buffer for each sound object and sound field in each audio period.

Because xrWaitAudioPeriodBD is a blocking function, applications typically submit the audio buffer within a dedicated audio thread.

Audio Period Synchronization

An audio period refers to a continuous block of time during which the application provides new input audio data and the runtime processes it for spatial rendering. Each audio period corresponds to one buffer of audio frames defined by XrSpatialAudioRendererCreateInfoBD::`framesPerBuffer`.

When an application waits for the next audio period using xrWaitAudioPeriodBD, it is effectively synchronizing with the runtime's internal audio rendering cycle. xrWaitAudioPeriodBD blocks its calling thread until the next audio period begins, or the specified timeout expires.

During each audio period:

- The application waits for the runtime to request new data by calling xrWaitAudioPeriodBD.
- The application submits new audio data for all sound fields and sound objects by calling xrSubmitSoundFieldBufferBD and/or xrSubmitSoundObjectBufferBD.
- After all submissions are completed, the application signals the end of submissions for this period with xrEndAudioPeriodBD.

This mechanism ensures that input buffers are consumed at the correct temporal cadence, matching the renderer's internal processing rate and preventing underruns or latency accumulation.

Thus, an application **must** follow the following call order to submit the audio buffers during each audio period:

1. Call xrWaitAudioPeriodBD to wait for the next audio period to begin.

2. Call xrSubmitSoundObjectBufferBD and/or xrSubmitSoundFieldBufferBD to submit audio buffers for sound objects and sound fields, if it submits buffers in this audio period.
3. Call xrEndAudioPeriodBD to notify the runtime of the end of buffer submissions for the current audio period.

If the application violates this call order, the runtime **must** return XR_ERROR_CALL_ORDER_INVALID for out-of-order calls.

The xrWaitAudioPeriodBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrWaitAudioPeriodBD(
    XrSpatialAudioRendererBD                    renderer,
    XrDuration                                  timeout);
```

Parameter Descriptions

- renderer is the XrSpatialAudioRendererBD which notifies the beginning of the next audio period.
- timeout is an XrDuration that specifies the maximum duration to wait for the next audio period in nanoseconds.

This function blocks the calling thread until the next audio period begins or the specified timeout expires.

The runtime **must** only unblock the calling thread after the previously submitted audio buffers are processed and before the previous output audio is done playing, so that output audio is gapless.

The runtime **should** unblock the calling thread as soon as possible after the above criteria is met.

If a previous call to xrEndAudioPeriodBD has not been successful, this function **must** return XR_ERROR_CALL_ORDER_INVALID.

timeout **must** be greater than zero, otherwise the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

This function **must** return XR_TIMEOUT_EXPIRED if the specified timeout expires before the next audio period begins.

Calling this function **must** be externally synchronized by the application, concurrent calls **may** result in undefined behavior.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrWaitAudioPeriodBD
- renderer **must** be a valid XrSpatialAudioRendererBD handle

Thread Safety

- Access to the renderer parameter by any other xrWaitAudioPeriodBD or xrEndAudioPeriodBD call, soundField parameter by any other xrSubmitSoundFieldBufferBD call (if the soundField is a child of the renderer), and soundObject parameter by any other xrSubmitSoundObjectBufferBD call (if the soundObject is a child of the renderer) **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING
- XR_TIMEOUT_EXPIRED

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST

The xrEndAudioPeriodBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrEndAudioPeriodBD(
    XrSpatialAudioRendererBD                    renderer);
```

Parameter Descriptions

- `renderer` is the XrSpatialAudioRendererBD to be notified with the end of the current audio period.

This function notifies the runtime of the end of the current audio period, which means that the application finished submitting all audio buffers for the current audio period and the runtime **must** start further processing them for spatial rendering.

This function **must** only be called after a successful and not timed out call to xrWaitAudioPeriodBD, otherwise the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

Calling this function **must** be externally synchronized by the application, concurrent calls **may** result in undefined behavior.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to calling xrEndAudioPeriodBD
- `renderer` **must** be a valid XrSpatialAudioRendererBD handle

Thread Safety

- Access to the `renderer` parameter by any other xrWaitAudioPeriodBD or xrEndAudioPeriodBD call, `soundField` parameter by any other xrSubmitSoundFieldBufferBD call (if the `soundField` is a child of the `renderer`), and `soundObject` parameter by any other xrSubmitSoundObjectBufferBD call (if the `soundObject` is a child of the `renderer`) **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST

Audio Buffer Submission

Within each audio period, applications **should** submit the audio buffer for each sound object and sound field.

```
// Provided by XR_BD_spatial_audio_rendering
typedef struct XrAudioBufferBD {
    XrStructureType                 type;
    const void*                     next;
    XrAudioBufferChannelLayoutBD    channelLayout;
    uint32_t                        bufferChannels;
    uint32_t                        bufferLength;
    float*                          buffer;
} XrAudioBufferBD;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `channelLayout` is the XrAudioBufferChannelLayoutBD that specifies the memory layout of the audio data (for example interleaved or planar).
- `bufferChannels` is the number of channels in the audio `buffer`.
- `bufferLength` is the number of floating-point elements in `buffer`. It **must** be equal to the product of `bufferChannels` and the XrSpatialAudioRendererCreateInfoBD::`framesPerBuffer` used when creating the spatial audio renderer.
- `buffer` is a pointer to a floating-point array containing the audio data.

The audio data in `buffer` is stored in little-endian byte order.

`bufferLength` and `bufferChannels` **must** be compatible with the values specified in XrSpatialAudioRendererCreateInfoBD when creating the renderer. In particular, the application **must** set `bufferLength` to `bufferChannels` * XrSpatialAudioRendererCreateInfoBD::`framesPerBuffer`, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The application **must** ensure that the audio signal stored in this XrAudioBufferBD is sampled at a sample rate of XrSpatialAudioRendererCreateInfoBD::`sampleRate`. Supplying data from a mismatched sample rate results in unspecified behavior, commonly perceived as tempo/pitch shifts and spectral coloration.

Valid Usage (Implicit)

- The `XR_BD_spatial_audio_rendering` extension **must** be enabled prior to using XrAudioBufferBD
- `type` **must** be `XR_TYPE_AUDIO_BUFFER_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `channelLayout` **must** be a valid XrAudioBufferChannelLayoutBD value
- `buffer` **must** be a pointer to an array of `bufferLength` `float` values
- The `bufferLength` parameter **must** be greater than `0`

The XrAudioBufferChannelLayoutBD enumeration describes the channel layout of audio buffers.

```
// Provided by XR_BD_spatial_audio_rendering
typedef enum XrAudioBufferChannelLayoutBD {
    XR_AUDIO_BUFFER_CHANNEL_LAYOUT_INTERLEAVED_BD = 0,
    XR_AUDIO_BUFFER_CHANNEL_LAYOUT_PLANAR_BD = 1,
    XR_AUDIO_BUFFER_CHANNEL_LAYOUT_MAX_ENUM_BD = 0x7FFFFFFF
} XrAudioBufferChannelLayoutBD;
```

Enum	Description
XR_AUDIO_BUFFER_CHANNEL_LAYOUT_INTERLEAVED_BD	indicates that audio samples from all channels are stored in an interleaved layout, where successive frames contain one sample per channel (e.g. LRLRLR for stereo)
XR_AUDIO_BUFFER_CHANNEL_LAYOUT_PLANAR_BD	indicates that audio samples are stored in a planar layout, where all samples for one channel are contiguous in memory (e.g. LLL...RRR... for stereo)

The xrSubmitSoundFieldBufferBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrSubmitSoundFieldBufferBD(
    XrSoundFieldBD                              soundField,
    const XrAudioBufferBD*                      buffer);
```

Parameter Descriptions

- soundField is the XrSoundFieldBD to input audio signal.
- buffer is a pointer to an XrAudioBufferBD structure that contains the input audio signal.

This function submits an audio buffer to a sound field XrSoundFieldBD. The corresponding function for a sound object XrSoundObjectBD is xrSubmitSoundObjectBufferBD.

This function **must** only be called during an audio period, which is the time period after a successful and not timed out call to xrWaitAudioPeriodBD and before a successful call to xrEndAudioPeriodBD, otherwise the runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

For each sound field, this function **must** not be called more than once per audio period, otherwise the runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

The buffer **must**

- Have an XrAudioBufferBD::bufferChannels greater than 0 and match the channel count defined by

the channel mask and configuration used to create the XrSoundFieldBD.

- Have an XrAudioBufferBD::bufferLength that, when divided by the XrAudioBufferBD::bufferChannels, equals the XrSpatialAudioRendererCreateInfoBD::framesPerBuffer specified at the creation of the spatial audio renderer with xrCreateSpatialAudioRendererBD.

If any of the above conditions are not met, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

When valid audio is submitted, the runtime **must** correctly process and render the spatial audio.

Applications **must** not call this function concurrently with xrWaitAudioPeriodBD or xrEndAudioPeriodBD. Doing so **may** result in undefined behavior.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrSubmitSoundFieldBufferBD
- soundField **must** be a valid XrSoundFieldBD handle
- buffer **must** be a pointer to a valid XrAudioBufferBD structure

Thread Safety

- Access to soundField parameter by any other xrSubmitSoundFieldBufferBD call, as well as the renderer parameter by any other xrWaitAudioPeriodBD or xrEndAudioPeriodBD call (if the renderer is the parent of soundField) **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrSubmitSoundObjectBufferBD function is defined as:

```
// Provided by XR_BD_spatial_audio_rendering
XrResult xrSubmitSoundObjectBufferBD(
    XrSoundObjectBD                             soundObject,
    const XrAudioBufferBD*                      buffer);
```

Parameter Descriptions

- soundObject is the XrSoundObjectBD to input audio signal.
- buffer is a pointer to an XrAudioBufferBD structure that contains the input audio signal.

This function submits an audio buffer to a sound object XrSoundObjectBD. The corresponding function for a sound field XrSoundFieldBD is xrSubmitSoundFieldBufferBD.

This function **must** only be called during an audio period, which is the time period after a successful, not timed out call to xrWaitAudioPeriodBD and before a successful call to xrEndAudioPeriodBD, otherwise the runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

For each sound object, this function **must** not be called more than once per audio period, otherwise the runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

The buffer **must**

- Have XrAudioBufferBD::bufferChannels set to 1.
- Have an XrAudioBufferBD::bufferLength equal to the XrSpatialAudioRendererCreateInfoBD::framesPerBuffer specified when creating the spatial audio renderer with xrCreateSpatialAudioRendererBD.

If any of the above conditions are not met, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

When valid audio is submitted, the runtime **must** correctly process and render the spatial audio.

Applications **must** not call this function concurrently with xrWaitAudioPeriodBD or xrEndAudioPeriodBD. Doing so **may** result in undefined behavior.

Valid Usage (Implicit)

- The XR_BD_spatial_audio_rendering extension **must** be enabled prior to calling xrSubmitSoundObjectBufferBD
- soundObject **must** be a valid XrSoundObjectBD handle
- buffer **must** be a pointer to a valid XrAudioBufferBD structure

Thread Safety

- Access to soundObject parameter by any other xrSubmitSoundObjectBufferBD call, as well as the renderer parameter by any other xrWaitAudioPeriodBD or xrEndAudioPeriodBD call (if the renderer is the parent of soundObject) **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.88.6. Issues

This extension does not define separate structures for each audio frame type. Instead, it uses a flat array of floats for audio samples within XrAudioBufferBD.

Rationale:

- Using a flat array allows zero-copy or minimal-copy paths between application and runtime, improving data transfer efficiency and cache locality.
- The flat representation aligns with widely used audio APIs and formats (e.g. PCM float arrays), minimizing conversion overhead and easing interoperability.
- Requirements that would normally vary by frame type (channel count, layout, frames per buffer) are already expressed by fields in XrAudioBufferBD and XrSpatialAudioRendererCreateInfoBD, avoiding the need for per-type structs.
- All frame types share a common floating-point sample representation. Defining separate structures would introduce redundant fields and unnecessary complexity.

This design choice favors clarity and performance without reducing functionality.

12.88.7. Example code

```
XrInstance instance; // previously initialized
XrSession session;   // previously initialized
XrSpace space; //previously initialized
/*************************************************/
```

```
/* xrCreateSpatialAudioRendererBD */
/************************************************/

PFN_xrQueryFramesPerBufferRangeBD xrQueryFramesPerBufferRangeBD;
CHK_XR(xrGetInstanceProcAddr(instance, "xrQueryFramesPerBufferRangeBD",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrQueryFramesPerBufferRangeBD)));

PFN_xrEnumerateSupportedAudioSampleRateBD xrEnumerateSupportedAudioSampleRateBD;
CHK_XR(xrGetInstanceProcAddr(instance, "xrEnumerateSupportedAudioSampleRateBD",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrEnumerateSupportedAudioSampleRateBD)));

PFN_xrCreateSpatialAudioRendererBD xrCreateSpatialAudioRendererBD;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateSpatialAudioRendererBD",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrCreateSpatialAudioRendererBD)));

uint32_t sampleRateCount = 0;
CHK_XR(xrEnumerateSupportedAudioSampleRateBD(session, 0, &sampleRateCount, NULL));
std::vector<XrAudioSampleRateBD> sampleRates;
if (sampleRateCount != 0) {
    sampleRates.resize(sampleRateCount);
    CHK_XR(xrEnumerateSupportedAudioSampleRateBD(session, sampleRateCount,
&sampleRateCount, sampleRates.data()));
}

uint32_t minFramePerBuffer = 0;
uint32_t maxFramePerBuffer = 0;
CHK_XR(xrQueryFramesPerBufferRangeBD(session, sampleRates[0], &minFramePerBuffer,
&maxFramePerBuffer));

uint32_t framePerBuffer = 4096;
framePerBuffer = framePerBuffer < minFramePerBuffer ? minFramePerBuffer : framePerBuffer;
framePerBuffer = framePerBuffer > maxFramePerBuffer ? maxFramePerBuffer : framePerBuffer;

// Setup context config struct
XrSpatialAudioRendererCreateInfoBD createInfo{
    XR_TYPE_SPATIAL_AUDIO_RENDERER_CREATE_INFO_BD,
    NULL,
    framePerBuffer,  //  frames_per_buffer
    sampleRates[0]  //  sample rate
};

// Create and initialize spatial audio renderer for session
XrSpatialAudioRendererBD renderer;
CHK_XR(xrCreateSpatialAudioRendererBD(session, &createInfo, &renderer));
```

```
/*****************************************************************************/
/* Setting-up free-field spatialization for sound fields. The following functions are
used: */
/* - xrCreateSoundFieldBD */
/* - xrUpdateSoundFieldConfigBD */
/* - xrSubmitSoundFieldBufferBD */
/*****************************************************************************/

// Setup a 1st order ambisonic sound field config struct
XrSoundFieldChannelDefinitionAmbixBD ambix {
    XR_TYPE_SOUND_FIELD_CHANNEL_DEFINITION_AMBIX_BD,
    nullptr,
    XR_SOUND_FIELD_CHANNEL_MASK_AMBIX_1ST_ORDER_BD
};

XrSoundFieldConfigBD soundFieldConfig{
    XR_TYPE_SOUND_FIELD_CONFIG_BD,

12.89.1. Overview

This extension allows applications to request the runtime to detect and track spatial scene meshes of the physical environment.

This extension requires `XR_BD_spatial_sensing` to be enabled.

12.89.2. Permission

A runtime on an AOSP-based platform **must** verify that applications have the `com.picovr.permission.SPATIAL_DATA` permission both listed in their manifest and granted to use spatial mesh. Without it, runtime **must** set XrFutureCompletionEXT::`futureResult` to `XR_ERROR_PERMISSION_INSUFFICIENT` when the xrStartSenseDataProviderCompleteBD is called.

This is an auto-requested permission: if it is listed in the manifest but not yet granted or denied, the runtime **must** prompt the user to grant or deny the permission when xrCreateSenseDataProviderBD is called with a provider type that requires it.

This permission is also used by `XR_BD_spatial_anchor`.

This permission is also used by `XR_BD_spatial_scene`.

This permission is also used by `XR_BD_spatial_plane`.

12.89.3. Inspect System Capability

The XrSystemSpatialMeshPropertiesBD structure is defined as:

```
// Provided by XR_BD_spatial_mesh
typedef struct XrSystemSpatialMeshPropertiesBD {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialMesh;
} XrSystemSpatialMeshPropertiesBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsSpatialMesh` is an `XrBool32`, indicating if current system is capable of spatial mesh functionality.

An application **can** inspect whether the system is capable of spatial mesh functionality by chaining an XrSystemSpatialMeshPropertiesBD structure to the XrSystemProperties::`next` chain when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsSpatialMesh`, the system does not support spatial mesh functionality, and the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateSenseDataProviderBD when called with `XR_SENSE_DATA_PROVIDER_TYPE_MESH_BD`. The application **should** avoid using spatial mesh functionality when `supportsSpatialMesh` is `XR_FALSE`.

If XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` is `XR_FALSE`, then `supportsSpatialMesh` **must** also be `XR_FALSE`.

If a runtime returns `XR_TRUE` for `supportsSpatialMesh`, the system supports spatial mesh functionality. This implies that XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` **must** also be `XR_TRUE`.

Note that `supportsSpatialMesh` **may** be `XR_TRUE` even if running on an Android-based platform and the application does not have the required com.picovr.permission.SPATIAL_DATA permission both declared in the manifest and granted at runtime. Evaluation of permissions takes place later, in the asynchronous operation started by xrStartSenseDataProviderAsyncBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_mesh` extension **must** be enabled prior to using XrSystemSpatialMeshPropertiesBD
- `type` **must** be `XR_TYPE_SYSTEM_SPATIAL_MESH_PROPERTIES_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.89.4. Create Spatial Mesh Provider

The XrSenseDataProviderCreateInfoSpatialMeshBD structure is defined as:

```
// Provided by XR_BD_spatial_mesh
typedef struct XrSenseDataProviderCreateInfoSpatialMeshBD {
    XrStructureType               type;
    const void*                   next;
    XrSpatialMeshConfigFlagsBD    configFlags;
    XrSpatialMeshLodBD            lod;
} XrSenseDataProviderCreateInfoSpatialMeshBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `configFlags` is the XrSpatialMeshConfigFlagBitsBD of the configurations.
- `lod` is the XrSpatialMeshLodBD which represent spatial mesh level.

An application creates an XrSenseDataProviderBD handle representing a a spatial mesh provider by calling xrCreateSenseDataProviderBD, setting XrSenseDataProviderCreateInfoBD::`providerType` equal to the XrSenseDataProviderTypeBD value `XR_SENSE_DATA_PROVIDER_TYPE_MESH_BD`, and chaining XrSenseDataProviderCreateInfoSpatialMeshBD to XrSenseDataProviderCreateInfoBD::`next`. Both the XrSenseDataProviderTypeBD value and the chained XrSenseDataProviderCreateInfoSpatialMeshBD structure are required. If XrSenseDataProviderCreateInfoBD::`providerType` is equal to `XR_SENSE_DATA_PROVIDER_TYPE_MESH_BD` but XrSenseDataProviderCreateInfoSpatialMeshBD is not in the `next` chain, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

An application uses such a provider to obtain the spatial mesh info that is detected and tracked by the runtime. This data generally consists of spatial entities with at least a XrSpatialEntityComponentDataTriangleMeshBD component.

Valid Usage (Implicit)

- The `XR_BD_spatial_mesh` extension **must** be enabled prior to using XrSenseDataProviderCreateInfoSpatialMeshBD
- `type` **must** be `XR_TYPE_SENSE_DATA_PROVIDER_CREATE_INFO_SPATIAL_MESH_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `configFlags` **must** be `0` or a valid combination of XrSpatialMeshConfigFlagBitsBD values
- `lod` **must** be a valid XrSpatialMeshLodBD value

The enumeration XrSpatialMeshConfigFlagsBD is defined as:

```
// Provided by XR_BD_spatial_mesh
typedef XrFlags64 XrSpatialMeshConfigFlagsBD;
```

The XrSenseDataProviderCreateInfoSpatialMeshBD::configFlags member is of the type XrSpatialMeshConfigFlagsBD, and contains a bitwise-OR of zero or more of the bits defined in XrSpatialMeshConfigFlagBitsBD.

Valid bits for XrSpatialMeshConfigFlagsBD are defined by XrSpatialMeshConfigFlagBitsBD, which is specified as:

```
// Provided by XR_BD_spatial_mesh
// Flag bits for XrSpatialMeshConfigFlagsBD
static const XrSpatialMeshConfigFlagsBD XR_SPATIAL_MESH_CONFIG_SEMANTIC_BIT_BD =
0x00000001;
static const XrSpatialMeshConfigFlagsBD
XR_SPATIAL_MESH_CONFIG_ALIGN_SEMANTIC_WITH_VERTEX_BIT_BD = 0x00000002;
```

Flag Descriptions

- XR_SPATIAL_MESH_CONFIG_SEMANTIC_BIT_BD — Detect and include semantic label component data in the spatial entity.
- XR_SPATIAL_MESH_CONFIG_ALIGN_SEMANTIC_WITH_VERTEX_BIT_BD — Semantic labels are associated with each vertex, otherwise, semantic labels are associated with each triangle face by default. It only takes effect if XR_SPATIAL_MESH_CONFIG_SEMANTIC_BIT_BD is set

If XR_SPATIAL_MESH_CONFIG_SEMANTIC_BIT_BD is not set, the XR_SPATIAL_MESH_CONFIG_ALIGN_SEMANTIC_WITH_VERTEX_BIT_BD takes no effect. If XR_SPATIAL_MESH_CONFIG_ALIGN_SEMANTIC_WITH_VERTEX_BIT_BD is not set, each semantic label corresponds to each vertex. If XR_SPATIAL_MESH_CONFIG_ALIGN_SEMANTIC_WITH_VERTEX_BIT_BD is set, each semantic label corresponds to three indices.

The XrSpatialMeshLodBD enumeration identifies the different LOD levels.

```
// Provided by XR_BD_spatial_mesh
typedef enum XrSpatialMeshLodBD {
    XR_SPATIAL_MESH_LOD_COARSE_BD = 0,
    XR_SPATIAL_MESH_LOD_MEDIUM_BD = 1,
    XR_SPATIAL_MESH_LOD_FINE_BD = 2,
    XR_SPATIAL_MESH_LOD_MAX_ENUM_BD = 0x7FFFFFFF
} XrSpatialMeshLodBD;
```

Enum	Description
XR_SPATIAL_MESH_LOD_COARSE_BD	Coarse level for the mesh with less details.
XR_SPATIAL_MESH_LOD_MEDIUM_BD	Medium level for the mesh.
XR_SPATIAL_MESH_LOD_FINE_BD	Fine level for the mesh with more details.

12.89.5. Start Spatial Mesh Provider

Applications start the spatial mesh data provider by calling xrStartSenseDataProviderAsyncBD after it is successfully created. To check the data provider state, call xrGetSenseDataProviderStateBD.

Subsequent application operations using this handle **must** not be performed unless the `futureResult` is `XR_SUCCESS`. If the `futureResult` returns an error code and the application needs to use the provider, the application **must** take appropriate action and try to call xrStartSenseDataProviderAsyncBD again before using the handle.

Detailed definitions and usage details are described in `XR_BD_spatial_sensing`.

12.89.6. Get Spatial Mesh Data

Applications query the latest detected spatial meshes from the spatial mesh data provider by calling xrQuerySenseDataAsyncBD. The runtime generates a snapshot of the spatial mesh information, from which the application **can** obtain detailed spatial mesh information. The mesh information is presented in the form of spatial entities which the application queries by calling xrGetQueriedSenseDataBD. Use xrEnumerateSpatialEntityComponentTypesBD to get the types of components contained within these entities, such as location, semantics, and mesh vertices and indices. To further retrieve component data information, call xrGetSpatialEntityComponentDataBD.

When the spatial mesh information changes, the runtime **must** queue an XrEventDataSenseDataUpdatedBD event with the handle of the spatial mesh provider.

When the application receives this event, it means the sense data provider has updated mesh data. A new query request for this sense data provider will get the latest, updated mesh data. This is the recommended way to get updated data.

Alternatively, the application **may** query the latest spatial mesh information at a time that suits its needs, independent of the update events.

All the functions to get spatial mesh info are defined in `XR_BD_spatial_sensing`.

12.89.7. New Structures

12.90.1. Overview

This extension allows applications to request the runtime to detect and track planes in the physical environment. This extension requires XR_BD_spatial_sensing to be enabled.

12.90.2. Permission

A runtime on an AOSP-based platform **must** verify that applications have the com.picovr.permission.SPATIAL_DATA permission both listed in their manifest and granted to use spatial plane. Without it, runtime **must** set XrFutureCompletionEXT::futureResult to XR_ERROR_PERMISSION_INSUFFICIENT when the xrStartSenseDataProviderCompleteBD is called.

This is an auto-requested permission: if it is listed in the manifest but not yet granted or denied, the runtime **must** prompt the user to grant or deny the permission when xrCreateSenseDataProviderBD is called with a provider type that requires it.

This permission is also used by XR_BD_spatial_anchor.

This permission is also used by XR_BD_spatial_mesh.

This permission is also used by XR_BD_spatial_scene.

12.90.3. Inspect System Capability

The XrSystemSpatialPlanePropertiesBD structure is defined as:

```
// Provided by XR_BD_spatial_plane
typedef struct XrSystemSpatialPlanePropertiesBD {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialPlane;
} XrSystemSpatialPlanePropertiesBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsSpatialPlane` is an `XrBool32`, indicating if the current system is capable of spatial plane functionality.

An application **can** inspect whether the system is capable of spatial plane functionality by chaining an XrSystemSpatialPlanePropertiesBD structure to the XrSystemProperties::`next` chain when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsSpatialPlane`, the system does not support spatial plane functionality, and the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateSenseDataProviderBD when called with `XR_SENSE_DATA_PROVIDER_TYPE_PLANE_BD`.

The application **should** avoid using spatial plane functionality when `supportsSpatialPlane` is `XR_FALSE`.

If XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` is `XR_FALSE`, then `supportsSpatialPlane` **must** also be `XR_FALSE`.

If the runtime returns `XR_TRUE` for `supportsSpatialPlane`, the system supports spatial plane functionality. This implies that XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` **must** also be `XR_TRUE`.

Note that `supportsSpatialPlane` **may** be `XR_TRUE` even if running on an Android-based platform and the application does not have the required com.picovr.permission.SPATIAL_DATA permission both declared in the manifest and granted at runtime. Evaluation of permissions takes place later, in the asynchronous operation started by xrStartSenseDataProviderAsyncBD.

Valid Usage (Implicit)

- The XR_BD_spatial_plane extension **must** be enabled prior to using XrSystemSpatialPlanePropertiesBD
- type **must** be XR_TYPE_SYSTEM_SPATIAL_PLANE_PROPERTIES_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.90.4. Create Spatial Plane Provider

Applications create an XrSenseDataProviderBD handle representing a spatial plane provider by calling xrCreateSenseDataProviderBD, and setting XrSenseDataProviderCreateInfoBD::providerType to the XrSenseDataProviderTypeBD value XR_SENSE_DATA_PROVIDER_TYPE_PLANE_BD.

Applications use this provider handle to obtain information about spatial planes that are detected and tracked by the runtime. This data generally consists of spatial entities with at least a plane orientation component which corresponds to an XrSpatialEntityComponentTypeBD value of XR_SPATIAL_ENTITY_COMPONENT_TYPE_PLANE_ORIENTATION_BD and a triangle mesh component which corresponds to an XrSpatialEntityComponentTypeBD value of XR_SPATIAL_ENTITY_COMPONENT_TYPE_TRIANGLE_MESH_BD.

This provider type does not define any configuration and does not require a chained structure.

12.90.5. Start Spatial Plane Provider

Applications start the spatial plane data provider by calling xrStartSenseDataProviderAsyncBD after it has been successfully created. To check the data provider state, call xrGetSenseDataProviderStateBD.

Subsequent application operations using this provider handle **must** not be performed unless the data provider state is XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD. If the data provider state is not XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD and the application intends to use the provider, the application **must** take appropriate action and call xrStartSenseDataProviderAsyncBD again before using the handle.

Detailed definitions and usage details are described in XR_BD_spatial_sensing.

12.90.6. Get Spatial Plane Data

Applications query the latest detected spatial planes from the spatial plane data provider by calling xrQuerySenseDataAsyncBD. The runtime generates a snapshot of the spatial plane information, from which the application **can** obtain detailed spatial plane information. The plane information is presented in the form of spatial entities which the application queries by calling xrGetQueriedSenseDataBD. Use xrEnumerateSpatialEntityComponentTypesBD to get the types of components contained within these entities, such as location, semantics, vertices and indices. To further retrieve component data information, call xrGetSpatialEntityComponentDataBD.

When the runtime's understanding of the detected spatial planes changes, the runtime **must** queue an XrEventDataSenseDataUpdatedBD event with the handle of the spatial plane provider.

Receiving this event signals to the application that updated plane data is available to query from the sense data provider. A new query request for this sense data provider will get the latest, updated plane data. This is the recommended way to get updated data.

The application **may** also initiate a new query request at any time without receiving this event, but the queried data **may** be unmodified.

All the functions to get spatial plane info are defined in XR_BD_spatial_sensing.

12.90.7. Acquire Plane Orientation

The XrPlaneOrientationBD enumeration identifies the different orientation of a spatial plane.

```
// Provided by XR_BD_spatial_plane
typedef enum XrPlaneOrientationBD {
    XR_PLANE_ORIENTATION_HORIZONTAL_UPWARD_BD = 0,
    XR_PLANE_ORIENTATION_HORIZONTAL_DOWNWARD_BD = 1,
    XR_PLANE_ORIENTATION_VERTICAL_BD = 2,
    XR_PLANE_ORIENTATION_ARBITRARY_BD = 3,
    XR_PLANE_ORIENTATION_MAX_ENUM_BD = 0x7FFFFFFF
} XrPlaneOrientationBD;
```

Enum	Description
XR_PLANE_ORIENTATION_HORIZONTAL_UPWARD_BD	The detected plane is horizontal and faces upward (e.g. floor).
XR_PLANE_ORIENTATION_HORIZONTAL_DOWNWARD_BD	The detected plane is horizontal and faces downward (e.g. ceiling).
XR_PLANE_ORIENTATION_VERTICAL_BD	The detected plane is vertical (e.g. wall).
XR_PLANE_ORIENTATION_ARBITRARY_BD	The detected plane has an arbitrary, non-vertical and non-horizontal orientation.

The XrSpatialEntityComponentDataPlaneOrientationBD structure is defined as:

```
// Provided by XR_BD_spatial_plane
typedef struct XrSpatialEntityComponentDataPlaneOrientationBD {
    XrStructureType         type;
    void*                   next;
    XrPlaneOrientationBD    orientation;
} XrSpatialEntityComponentDataPlaneOrientationBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `orientation` is the pointer to XrPlaneOrientationBD.

XrSpatialEntityComponentDataPlaneOrientationBD is an output structure for getting the plane orientation component data from a snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of `XR_SPATIAL_ENTITY_COMPONENT_TYPE_PLANE_ORIENTATION_BD`.

Valid Usage (Implicit)

- The `XR_BD_spatial_plane` extension **must** be enabled prior to using XrSpatialEntityComponentDataPlaneOrientationBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_PLANE_ORIENTATION_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `orientation` **must** be a valid XrPlaneOrientationBD value

12.90.8. Spatial Plane Component Orientation Filter

The XrSenseDataFilterPlaneOrientationBD structure is defined as:

```
// Provided by XR_BD_spatial_plane
typedef struct XrSenseDataFilterPlaneOrientationBD {
    XrStructureType          type;
    const void*              next;
    uint32_t                 orientationCount;
    XrPlaneOrientationBD*    orientations;
} XrSenseDataFilterPlaneOrientationBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `orientationCount` is the count of XrPlaneOrientationBD.
- `orientations` is a pointer to the XrPlaneOrientationBD array.

The XrSenseDataFilterPlaneOrientationBD structure contains a list of plane orientations. When the

application passes this filter, all sense data that matches the criteria in the filter is included in the result returned. The runtime **must** not include sense data that does not match the provided filter.

Valid Usage (Implicit)

- The `XR_BD_spatial_plane` extension **must** be enabled prior to using XrSenseDataFilterPlaneOrientationBD
- `type` **must** be `XR_TYPE_SENSE_DATA_FILTER_PLANE_ORIENTATION_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `orientations` **must** be a pointer to an array of `orientationCount` XrPlaneOrientationBD values
- The `orientationCount` parameter **must** be greater than `0`

12.90.9. New Structures

- Extending XrSenseDataQueryInfoBD:
  - XrSenseDataFilterPlaneOrientationBD
- Extending XrSpatialEntityComponentDataBaseHeaderBD:
  - XrSpatialEntityComponentDataPlaneOrientationBD
- Extending XrSystemProperties:
  - XrSystemSpatialPlanePropertiesBD

12.91.1. Overview

This extension allows applications to request the runtime to start capturing spatial scene information from the physical environment and query the information that the system has captured and stored.

Different objects in the scene are be represented by different component data. For example, 2D bounding boxes or polygons might be associated with walls, floors, ceilings, doors, and windows; 3D bounding boxes might be associated with tables, chairs and beds.

The general workflow for applications to use the scene capture process includes the following typical steps:

1. Initiate the scene capture process by invoking xrCaptureSceneAsyncBD. Once the call to xrCaptureSceneAsyncBD is successful, poll the returned future by using xrPollFutureEXT.
2. Typically, upon successful initiation of the scene capture process, the current application will be sent to the background. Therefore, the application **should** call xrEndSession to stop the current session upon receiving the XrEventDataSessionStateChanged event with XrEventDataSessionStateChanged::`state` set to `XR_SESSION_STATE_STOPPING`.
3. After the scene capture process is completed, the application will be brought back to the foreground. At this point, the application **should** call xrBeginSession to resume the session, when it receives the XrEventDataSessionStateChanged event with XrEventDataSessionStateChanged::`state` set to `XR_SESSION_STATE_READY`.
4. Generally, the future will be ready once the session has been restarted. If an error occurs during the scene capture process, the future result is an error code. For instance, if the scene capture process exits abnormally, an `XR_ERROR_SCENE_CAPTURE_FAILURE_BD` future result will be returned.
5. After receiving an XrEventDataSenseDataUpdatedBD, query the updated spatial scene data by calling xrQuerySenseDataAsyncBD. Subsequently, the application **can** obtain the updated data by following the steps outlined in `XR_BD_spatial_sensing`.

This extension requires `XR_BD_spatial_sensing` to also be enabled.

12.91.2. Permission

A runtime on an AOSP-based platform **must** verify that applications have the `com.picovr.permission.SPATIAL_DATA` permission both listed in their manifest and granted to use spatial scene capture. Without it, runtime **must** set XrFutureCompletionEXT::`futureResult` to `XR_ERROR_PERMISSION_INSUFFICIENT` when the xrStartSenseDataProviderCompleteBD is called.

This is an auto-requested permission: if it is listed in the manifest but not yet granted or denied, the runtime **must** prompt the user to grant or deny the permission when xrCreateSenseDataProviderBD is called with a provider type that requires it.

This permission is also used by `XR_BD_spatial_anchor`.

This permission is also used by `XR_BD_spatial_mesh`.

This permission is also used by `XR_BD_spatial_plane`.

12.91.3. Inspect System Capability

The XrSystemSpatialScenePropertiesBD structure is defined as:

```
// Provided by XR_BD_spatial_scene
typedef struct XrSystemSpatialScenePropertiesBD {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialScene;
} XrSystemSpatialScenePropertiesBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsSpatialScene` is an `XrBool32`, indicating if the current system is capable of spatial scene functionality.

An application **can** inspect whether the system is capable of spatial scene functionality by chaining an XrSystemSpatialScenePropertiesBD structure to the XrSystemProperties::`next` chain when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsSpatialScene`, the system does not support spatial scene functionality, and **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateSenseDataProviderBD when passing the XrSenseDataProviderTypeBD value `XR_SENSE_DATA_PROVIDER_TYPE_SCENE_BD`.

The application **should** avoid using spatial scene functionality when `supportsSpatialScene` is `XR_FALSE`.

If XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` is `XR_FALSE`, then `supportsSpatialScene` **must** also be `XR_FALSE`.

If a runtime returns `XR_TRUE` for `supportsSpatialScene`, the system supports spatial scene functionality. This implies that XrSystemSpatialSensingPropertiesBD::`supportsSpatialSensing` **must** also be `XR_TRUE`.

Note that `supportsSpatialScene` **may** be `XR_TRUE` even if running on an Android-based platform and the application does not have the required com.picovr.permission.SPATIAL_DATA permission both declared in the manifest and granted at runtime. Evaluation of permissions takes place later, in the asynchronous operation started by xrStartSenseDataProviderAsyncBD.

Valid Usage (Implicit)

- The XR_BD_spatial_scene extension **must** be enabled prior to using XrSystemSpatialScenePropertiesBD
- type **must** be XR_TYPE_SYSTEM_SPATIAL_SCENE_PROPERTIES_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.91.4. Create Spatial Scene Provider

An application creates an XrSenseDataProviderBD handle representing a spatial scene data provider by calling xrCreateSenseDataProviderBD after setting XrSenseDataProviderCreateInfoBD::providerType equal to the XrSenseDataProviderTypeBD value XR_SENSE_DATA_PROVIDER_TYPE_SCENE_BD.

An application uses such a provider to obtain the spatial scene info that is captured and stored by the system scene capture process.

This provider type does not define any configuration and does not require a chained structure.

12.91.5. Start Spatial Scene Provider

Applications start the spatial scene data provider by calling xrStartSenseDataProviderAsyncBD after it is successfully created. To check the data provider state, call xrGetSenseDataProviderStateBD.

Subsequent application operations using this provider handle **must** not be performed unless the data provider state is XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD. If the data provider state is not XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD and the application needs to use the provider, the application **must** take appropriate action and try to call xrStartSenseDataProviderAsyncBD again before using the handle.

Detailed definitions and usage details are described in XR_BD_spatial_sensing.

12.91.6. Get Captured Scene Info

Applications query the latest captured scene information from the spatial scene data provider by calling xrQuerySenseDataAsyncBD. The runtime generates a snapshot of the spatial scene information, from which the application **can** obtain detailed scene information. The scene information is presented in the form of spatial entities which the application queries by calling xrGetQueriedSenseDataBD. Use xrEnumerateSpatialEntityComponentTypesBD to get the types of components contained within these entities, such as location, semantics, and bounding boxes. To further retrieve component information, call xrGetSpatialEntityComponentDataBD.

When the scene information changes, the runtime **must** queue an XrEventDataSenseDataUpdatedBD event with the handle of the spatial scene provider.

When the application receives this event, it means the sense data provider has updated scene data. A new query request for this sense data provider will get the latest, updated scene data. This is the recommended way to get updated data. Without receiving this event, the application also **may** initiate a new query request at any time, but the queried data **may** be unmodified.

All the functions to get captured scene info are defined in `XR_BD_spatial_sensing`.

12.91.7. Start Scene Capture

The xrCaptureSceneAsyncBD function is defined as:

```
// Provided by XR_BD_spatial_scene
XrResult xrCaptureSceneAsyncBD(
    XrSenseDataProviderBD                       provider,
    const XrSceneCaptureInfoBD*                 info,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- `provider` is the previously created XrSenseDataProviderBD for spatial scene.
- `info` is a pointer to the XrSceneCaptureInfoBD.
- `future` is a pointer to the `XrFutureEXT`.

The application starts the scene capture process, which guides the user to capture the scene of the physical environment, by calling xrCaptureSceneAsyncBD.

This function starts an asynchronous operation and creates a corresponding `XrFutureEXT`, usable with xrPollFutureEXT and related functions. The return value of this function only indicates whether the parameters were acceptable to schedule the asynchronous operation. The corresponding completion function is xrStartSenseDataProviderCompleteBD, usable when a future from this function is in the READY state, with outputs populated by that function in the completion structure XrFutureCompletionEXT.

Note that scene capture **may** involve interaction by the user with system user interfaces. After calling this function, the system **may** switch the current application to the scene capture process. Accordingly, the runtime **may** emit an XrEventDataSessionStateChanged event with XrEventDataSessionStateChanged::`state` set to `XR_SESSION_STATE_STOPPING`, for the application to handle as usual, before scene capture results arrive.

Valid Usage (Implicit)

- The XR_BD_spatial_scene extension **must** be enabled prior to calling xrCaptureSceneAsyncBD
- provider **must** be a valid XrSenseDataProviderBD handle
- info **must** be a pointer to a valid XrSceneCaptureInfoBD structure
- future **must** be a pointer to an XrFutureEXT value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrSceneCaptureInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_scene
typedef struct XrSceneCaptureInfoBD {
    XrStructureType    type;
    const void*        next;
} XrSceneCaptureInfoBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

This structure is defined for future extension.

Valid Usage (Implicit)

- The XR_BD_spatial_scene extension **must** be enabled prior to using XrSceneCaptureInfoBD
- type **must** be XR_TYPE_SCENE_CAPTURE_INFO_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrCaptureSceneCompleteBD function is defined as:

```
// Provided by XR_BD_spatial_scene
XrResult xrCaptureSceneCompleteBD(
    XrSenseDataProviderBD                       provider,
    XrFutureEXT                                 future,
    XrFutureCompletionEXT*                      completion);
```

Parameter Descriptions

- provider is the XrSenseDataProviderBD.
- future is the XrFutureEXT.
- completion is a pointer to the XrFutureCompletionEXT.

The application obtains the scene capture starting result using xrCaptureSceneCompleteBD.

This is the completion function corresponding to the operation started by xrCaptureSceneAsyncBD. Do not call until the future is READY.

The XrFutureCompletionEXT structure is defined in XR_EXT_future.

Future Return Codes

XrFutureCompletionEXT::`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SCENE_CAPTURE_FAILURE_BD`

Valid Usage (Implicit)

- The `XR_BD_spatial_scene` extension **must** be enabled prior to calling xrCaptureSceneCompleteBD
- `provider` **must** be a valid XrSenseDataProviderBD handle
- `completion` **must** be a pointer to an XrFutureCompletionEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

12.92.1. Overview

This extension introduces a spatial sensing API framework which contains a set of common functions and data structures for various spatial sensing capabilities. In this extension, the EC (Entity-Component) pattern is used to denote the sensed object in the physical environment via spatial entity.

A spatial entity **may** be points of interest, physical plane surfaces, physical objects, mesh blocks, images, etc., and it **may** have different *components*. Having different components indicates that different data are attached to the spatial entity and different operations **can** be performed on it. Applications **can** get the component types that a given spatial entity has as well as the information of a specific component.

Different kinds of spatial sensing data are provided via different sense data providers. Applications **can** get the sensed spatial entity details from sense data providers.

The general workflow for applications to includes the following typical steps:

1. Create an XrSenseDataProviderBD with relevant configuration information via xrCreateSenseDataProviderBD.
2. Start the XrSenseDataProviderBD to let the runtime provide sensed data for that provider via xrStartSenseDataProviderAsyncBD.
3. Get the state of XrSenseDataProviderBD via xrGetSenseDataProviderStateBD, and make sure it is in the running state.
4. Initiate a query request to the XrSenseDataProviderBD via xrQuerySenseDataAsyncBD after receiving an XrEventDataSenseDataUpdatedBD, and the runtime will produce an XrSenseDataSnapshotBD, which contains the most recent data associated with this provider.
5. Retrieve the spatial entity info as well as the detailed component data from the XrSenseDataSnapshotBD via xrGetQueriedSenseDataBD and xrGetSpatialEntityComponentDataBD.
6. Destroy the XrSenseDataSnapshotBD after all the data infos are retrieved via xrDestroySenseDataSnapshotBD to release related resources. Applications **can** repeat step 4-6 to get the updated sense data if necessary.
7. Stop the XrSenseDataProviderBD via xrStopSenseDataProviderBD.
8. Destroy the XrSenseDataProviderBD via xrDestroySenseDataProviderBD to release the system resources associated with the provider.

Note

If any function returns an XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD, the service is unable to recover by itself, and the application **should** destroy the current XrInstance and create it again to use the service.

12.92.2. Inspect System Capability

The XrSystemSpatialSensingPropertiesBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSystemSpatialSensingPropertiesBD {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialSensing;
} XrSystemSpatialSensingPropertiesBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- supportsSpatialSensing is an XrBool32, indicating if current system is capable of spatial sensing.

An application **can** inspect whether the system is capable of spatial sensing by chaining an XrSystemSpatialSensingPropertiesBD structure to the XrSystemProperties::next chain when calling xrGetSystemProperties.

If a runtime returns XR_FALSE for supportsSpatialSensing, the system does not support spatial sensing, and the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrCreateSenseDataProviderBD.

If a runtime returns XR_TRUE for supportsSpatialSensing, the system supports spatial sensing.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSystemSpatialSensingPropertiesBD
- type **must** be XR_TYPE_SYSTEM_SPATIAL_SENSING_PROPERTIES_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.92.3. Create Sense Data Provider

The XrSenseDataProviderBD handle is defined as:

```
// Provided by XR_BD_spatial_sensing
XR_DEFINE_HANDLE(XrSenseDataProviderBD)
```

XrSenseDataProviderBD is a handle which the application creates to do spatial sensing for the user's physical environment.

The xrCreateSenseDataProviderBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrCreateSenseDataProviderBD(
    XrSession                                   session,
    const XrSenseDataProviderCreateInfoBD*      createInfo,
    XrSenseDataProviderBD*                      provider);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is a pointer to a valid XrSenseDataProviderCreateInfoBD.
- `provider` is a pointer to the XrSenseDataProviderBD that the runtime created.

The application **can** create a sense data provider using xrCreateSenseDataProviderBD. Different providers are associated with different XrSenseDataProviderTypeBD provider type values in XrSenseDataProviderCreateInfoBD::`providerType`. Some require additional parameters in structure types chained on to `createInfo`.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrCreateSenseDataProviderBD
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSenseDataProviderCreateInfoBD structure
- `provider` **must** be a pointer to an XrSenseDataProviderBD handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrSenseDataProviderCreateInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataProviderCreateInfoBD {
    XrStructureType              type;
    const void*                  next;
    XrSenseDataProviderTypeBD    providerType;
} XrSenseDataProviderCreateInfoBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- providerType is an XrSenseDataProviderTypeBD indicating the type of provider to create.

When the application creates an XrSenseDataProviderBD, it **must** specify the type of provider via providerType. If the value of providerType is not valid given the current enabled extensions, the runtime **must** return XR_ERROR_VALIDATION_FAILURE. Some provider types have additional parameters passed via the XrSenseDataProviderCreateInfoBD::next chain.

If a valid provider type is specified in `providerType` but that type requires an additional configuration structure that is not provided in the `next` chain, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`. Note that in accordance with Valid Usage for Structure Pointer Chains, configuration structures in the `next` chain for provider types other than the one indicated by `providerType` are ignored.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSenseDataProviderCreateInfoBD
- `type` **must** be `XR_TYPE_SENSE_DATA_PROVIDER_CREATE_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSenseDataProviderCreateInfoDynamicObjectBD, XrSenseDataProviderCreateInfoSpatialMeshBD
- `providerType` **must** be a valid XrSenseDataProviderTypeBD value

The XrSenseDataProviderTypeBD enumeration is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef enum XrSenseDataProviderTypeBD {
  // Provided by XR_BD_spatial_anchor
    XR_SENSE_DATA_PROVIDER_TYPE_ANCHOR_BD = 1000390000,
  // Provided by XR_BD_spatial_scene
    XR_SENSE_DATA_PROVIDER_TYPE_SCENE_BD = 1000392000,
  // Provided by XR_BD_spatial_mesh
    XR_SENSE_DATA_PROVIDER_TYPE_MESH_BD = 1000393000,
  // Provided by XR_BD_spatial_plane
    XR_SENSE_DATA_PROVIDER_TYPE_PLANE_BD = 1000396000,
  // Provided by XR_BD_dynamic_object_tracking
    XR_SENSE_DATA_PROVIDER_TYPE_DYNAMIC_OBJECT_BD = 1000746000,
    XR_SENSE_DATA_PROVIDER_TYPE_MAX_ENUM_BD = 0x7FFFFFFF
} XrSenseDataProviderTypeBD;
```

Enum	Description
`XR_SENSE_DATA_PROVIDER_TYPE_ANCHOR_BD`	Create arbitrary spatial anchors. (Added by the `XR_BD_spatial_anchor` extension)
`XR_SENSE_DATA_PROVIDER_TYPE_SCENE_BD`	Access spatial scene capture data. (Added by the `XR_BD_spatial_scene` extension)
`XR_SENSE_DATA_PROVIDER_TYPE_MESH_BD`	Capture spatial mesh data. (Added by the `XR_BD_spatial_mesh` extension)

Enum	Description
XR_SENSE_DATA_PROVIDER_TYPE_PLANE_BD	Capture spatial plane data. (Added by the XR_BD_spatial_plane extension)
XR_SENSE_DATA_PROVIDER_TYPE_DYNAMIC_OBJECT_BD	Capture dynamic object data. (Added by the XR_BD_dynamic_object_tracking extension)

12.92.4. Start Sense Data Provider

The xrStartSenseDataProviderAsyncBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrStartSenseDataProviderAsyncBD(
    XrSenseDataProviderBD                       provider,
    const XrSenseDataProviderStartInfoBD*       startInfo,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- provider is the sense data provider handle to be started.
- startInfo is a pointer to the XrSenseDataProviderStartInfoBD.
- future is a pointer to the XrFutureEXT.

The application **can** start a previously created sense data provider using xrStartSenseDataProviderAsyncBD when it is in either the XR_SENSE_DATA_PROVIDER_STATE_INITIALIZED_BD or the XR_SENSE_DATA_PROVIDER_STATE_STOPPED_BD state.

This function starts an asynchronous operation and creates a corresponding XrFutureEXT, usable with xrPollFutureEXT and related functions. The return value of this function only indicates whether the parameters were acceptable to schedule the asynchronous operation. The corresponding completion function is xrStartSenseDataProviderCompleteBD, usable when a future from this function is in the READY state, with outputs populated by that function in the completion structure XrFutureCompletionEXT.

If the sense data provider is already in the XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD state, calling this function does not change the provider state. In this case, the runtime **must** still set the return value of xrStartSenseDataProviderAsyncBD to XR_SUCCESS, and the future state will be XR_FUTURE_STATE_READY_EXT immediately. The runtime **must** set the corresponding future result returned by xrStartSenseDataProviderCompleteBD to XR_SUCCESS.

Individual sense data provider types **may** specify required a permission or permissions to use their capabilities on AOSP-based platforms. If the specified provider type requires a permission and that permission is not listed in the application's manifest, or the permission is listed but denied, the future

state will be XR_FUTURE_STATE_READY_EXT immediately and the runtime **must** set the corresponding future result returned by xrStartSenseDataProviderCompleteBD to XR_ERROR_PERMISSION_INSUFFICIENT.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to calling xrStartSenseDataProviderAsyncBD
- provider **must** be a valid XrSenseDataProviderBD handle
- startInfo **must** be a pointer to a valid XrSenseDataProviderStartInfoBD structure
- future **must** be a pointer to an XrFutureEXT value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrSenseDataProviderStartInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataProviderStartInfoBD {
    XrStructureType    type;
    const void*        next;
} XrSenseDataProviderStartInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

This structure is defined for future extension.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSenseDataProviderStartInfoBD
- `type` **must** be `XR_TYPE_SENSE_DATA_PROVIDER_START_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrStartSenseDataProviderCompleteBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrStartSenseDataProviderCompleteBD(
    XrSession                                   session,
    XrFutureEXT                                 future,
    XrFutureCompletionEXT*                      completion);
```

Parameter Descriptions

- `session` is the XrSession.
- `future` is the `XrFutureEXT` previously returned by xrStartSenseDataProviderAsyncBD.
- `completion` is a pointer to the XrFutureCompletionEXT.

The application **can** obtain the sense data provider start result using xrStartSenseDataProviderCompleteBD.

This is the completion function corresponding to the operation started by xrStartSenseDataProviderAsyncBD. Do not call until the `future` is READY.

The XrFutureCompletionEXT structure is defined in `XR_EXT_future`.

Future Return Codes

XrFutureCompletionEXT::`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_PERMISSION_INSUFFICIENT`

Subsequent application operations using this handle **must** not be performed unless the XrFutureCompletionEXT::`futureResult` is `XR_SUCCESS`. For example, if the XrFutureCompletionEXT::`futureResult` is `XR_ERROR_PERMISSION_INSUFFICIENT`, it indicates that the application does not have sufficient permissions and needs to apply for the corresponding permissions.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrStartSenseDataProviderCompleteBD
- `session` **must** be a valid XrSession handle
- `completion` **must** be a pointer to an XrFutureCompletionEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

12.92.5. Get Sense Data Provider State

The xrGetSenseDataProviderStateBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrGetSenseDataProviderStateBD(
    XrSenseDataProviderBD                       provider,
    XrSenseDataProviderStateBD*                 state);
```

Parameter Descriptions

- provider is the XrSenseDataProviderBD handle.
- state is a pointer to the XrSenseDataProviderStateBD.

The application **can** get a sense data provider's state by calling xrGetSenseDataProviderStateBD.

Figure 29. XrSenseDataProviderStateBD

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrGetSenseDataProviderStateBD
- `provider` **must** be a valid XrSenseDataProviderBD handle
- `state` **must** be a pointer to an XrSenseDataProviderStateBD value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSenseDataProviderStateBD enumeration identifies the various states of the sense data provider.

```
// Provided by XR_BD_spatial_sensing
typedef enum XrSenseDataProviderStateBD {
    XR_SENSE_DATA_PROVIDER_STATE_INITIALIZED_BD = 0,
    XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD = 1,
    XR_SENSE_DATA_PROVIDER_STATE_STOPPED_BD = 2,
    XR_SENSE_DATA_PROVIDER_STATE_MAX_ENUM_BD = 0x7FFFFFFF
} XrSenseDataProviderStateBD;
```

Enum	Description
`XR_SENSE_DATA_PROVIDER_STATE_INITIALIZED_BD`	The state after the provider is successfully created, which means the provider is ready to start.

Enum	Description
XR_SENSE_DATA_PROVIDER_STATE_RUNNING_BD	The state when the provider is running normally.
XR_SENSE_DATA_PROVIDER_STATE_STOPPED_BD	The state after the provider is successfully stopped, or when an unexpected error occurs.

The XrEventDataSenseDataProviderStateChangedBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrEventDataSenseDataProviderStateChangedBD {
    XrStructureType               type;
    const void*                   next;
    XrSenseDataProviderBD         provider;
    XrSenseDataProviderStateBD    newState;
} XrEventDataSenseDataProviderStateChangedBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- provider is the XrSenseDataProviderBD handle.
- newState is the new XrSenseDataProviderStateBD of the provider.

This event indicates the state change of the sense data provider. The runtime **must** queue an event of type XR_TYPE_EVENT_DATA_SENSE_DATA_PROVIDER_STATE_CHANGED_BD when a specific sense data provider changes from one state to another state. When the application calls xrCreateSenseDataProviderBD and the return code is XR_SUCCESS, the runtime **must** set the provider's state to XR_SENSE_DATA_PROVIDER_STATE_INITIALIZED_BD without queuing an event of type XR_TYPE_EVENT_DATA_SENSE_DATA_PROVIDER_STATE_CHANGED_BD.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrEventDataSenseDataProviderStateChangedBD
- type **must** be XR_TYPE_EVENT_DATA_SENSE_DATA_PROVIDER_STATE_CHANGED_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.92.6. Query Sense Data

When a sense data provider is running, the application **can** initiate a query that creates a snapshot of the sense data from the current sense data provider.

The XrSenseDataSnapshotBD handle is defined as:

```
// Provided by XR_BD_spatial_sensing
XR_DEFINE_HANDLE(XrSenseDataSnapshotBD)
```

The xrQuerySenseDataAsyncBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrQuerySenseDataAsyncBD(
    XrSenseDataProviderBD                       provider,
    const XrSenseDataQueryInfoBD*               queryInfo,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- `provider` is the XrSenseDataProviderBD handle to query.
- `queryInfo` is the XrSenseDataQueryInfoBD.
- `future` is the pointer to the returned `XrFutureEXT`.

The application **can** query a sense data provider by calling xrQuerySenseDataAsyncBD.

The application **must** not call this function to initiate a query request for the spatial sense data unless the xrStartSenseDataProviderCompleteBD has been called successfully, the future completed, and returned a future result of `XR_SUCCESS`. Otherwise, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`. The query result is a snapshot of the sense data from the current sense data provider.

This function starts an asynchronous operation and creates a corresponding `XrFutureEXT`, usable with xrPollFutureEXT and related functions. The return value of this function only indicates whether the parameters were acceptable to schedule the asynchronous operation. The corresponding completion function is xrQuerySenseDataCompleteBD, usable when a future from this function is in the READY state, with outputs populated by that function in the completion structure XrSenseDataQueryCompletionBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrQuerySenseDataAsyncBD
- `provider` **must** be a valid XrSenseDataProviderBD handle
- `queryInfo` **must** be a pointer to a valid XrSenseDataQueryInfoBD structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CALL_ORDER_INVALID`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSenseDataQueryInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataQueryInfoBD {
    XrStructureType    type;
    const void*        next;
} XrSenseDataQueryInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

When the application initiates a query request, it **can** chain a `XrSenseDataFilter*` structure to XrSenseDataQueryInfoBD::`next`. Then all sense data that matches the criteria in the filter is included in the result returned. The runtime **must** not include sense data that does not match the provided filter.

If no `XrSenseDataFilter*` structure is chained to XrSenseDataQueryInfoBD::`next`, it means no filter is applied, and runtime **must** include all currently detected sense data of this provider in the result.

Note

Currently, only the first filter in the XrSenseDataQueryInfoBD::`next` chain takes effect.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSenseDataQueryInfoBD
- `type` **must** be `XR_TYPE_SENSE_DATA_QUERY_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSenseDataFilterDynamicObjectTypeBD, XrSenseDataFilterPlaneOrientationBD, XrSenseDataFilterSemanticBD, XrSenseDataFilterUuidBD

Some commonly used filters are defined in this extension.

The XrSenseDataFilterUuidBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataFilterUuidBD {
    XrStructureType     type;
    const void*         next;
    uint32_t            uuidCount;
    const XrUuidEXT*    uuids;
} XrSenseDataFilterUuidBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuidCount` is the count of XrUuidEXT.
- `uuids` is a pointer to the XrUuidEXT array.

The XrSenseDataFilterUuidBD contains a list of UUIDs. When the application passes this filter, the query result will only contain entities with UUIDs that appear in this list.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSenseDataFilterUuidBD
- `type` **must** be `XR_TYPE_SENSE_DATA_FILTER_UUID_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

The XrSenseDataFilterSemanticBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataFilterSemanticBD {
    XrStructureType             type;
    const void*                 next;
    uint32_t                    labelCount;
    const XrSemanticLabelBD*    labels;
} XrSenseDataFilterSemanticBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `labelCount` is the number of XrSemanticLabelBD elements in `labels`.
- `labels` is a pointer to the XrSemanticLabelBD array.

The XrSenseDataFilterSemanticBD contains a list of semantic labels. When the application passes this

filter, the query result will only contain entities with semantic labels that appear in this list.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSenseDataFilterSemanticBD
- `type` **must** be `XR_TYPE_SENSE_DATA_FILTER_SEMANTIC_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `labels` **must** be a pointer to an array of `labelCount` valid XrSemanticLabelBD values
- The `labelCount` parameter **must** be greater than `0`

The xrQuerySenseDataCompleteBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrQuerySenseDataCompleteBD(
    XrSenseDataProviderBD                       provider,
    XrFutureEXT                                 future,
    XrSenseDataQueryCompletionBD*               completion);
```

Parameter Descriptions

- `provider` is the XrSenseDataProviderBD.
- `future` is the `XrFutureEXT` previously returned by xrQuerySenseDataAsyncBD.
- `completion` is the XrSenseDataQueryCompletionBD.

This is the completion function corresponding to xrQuerySenseDataAsyncBD. It completes the asynchronous operation and returns the results. Do not call until the `future` is READY.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to calling xrQuerySenseDataCompleteBD
- `provider` **must** be a valid XrSenseDataProviderBD handle
- `completion` **must** be a pointer to an XrSenseDataQueryCompletionBD structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrSenseDataQueryCompletionBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSenseDataQueryCompletionBD {
    XrStructureType          type;
    void*                    next;
    XrResult                 futureResult;
    XrSenseDataSnapshotBD    snapshot;
} XrSenseDataQueryCompletionBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- futureResult is the XrResult of the future.
- snapshot is the XrSenseDataSnapshotBD handle of the query result.

If the futureResult is not XR_SUCCESS, the runtime **must** set snapshot to XR_NULL_HANDLE.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSenseDataQueryCompletionBD
- `type` **must** be `XR_TYPE_SENSE_DATA_QUERY_COMPLETION_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `futureResult` **must** be a valid XrResult value
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle

The xrDestroySenseDataSnapshotBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrDestroySenseDataSnapshotBD(
    XrSenseDataSnapshotBD                       snapshot);
```

Parameter Descriptions

- `snapshot` is the XrSenseDataSnapshotBD to be destroyed.

The application **can** destroy a sense data snapshot using xrDestroySenseDataSnapshotBD.

After all the spatial entity info are retrieved from the snapshot, application **should** destroy the

XrSenseDataSnapshotBD handle to release related resources. The runtime **may** have an upper limit on the number of snapshots it supports. When the application exceeds the runtime's limit, the runtime **must** set XrSenseDataQueryCompletionBD::`futureResult` to `XR_ERROR_LIMIT_REACHED` when xrQuerySenseDataCompleteBD is called. To obtain new snapshots once the limit is reached, destroy at least one of the previously obtained snapshots.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrDestroySenseDataSnapshotBD
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle

Thread Safety

- Access to `snapshot`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`

12.92.7. Spatial Entity

The `XrSpatialEntityIdBD` atom is defined as:

```
// Provided by XR_BD_spatial_sensing
XR_DEFINE_ATOM(XrSpatialEntityIdBD)
```

The `XrSpatialEntityIdBD` is used to represent the spatial entities that are sensed by the runtime in the user's physical environment. The application **can** obtain spatial entity information from the XrSenseDataSnapshotBD. This atom is retrieved from XrSenseDataSnapshotBD and shares its lifetime.

The application **must** not use an XrSpatialEntityIdBD with a snapshot it was not retrieved from. The same numerical value of ID **may** be reused between different snapshots for different entities. See xrGetSpatialEntityUuidBD for a more stable ID.

12.92.8. Spatial Entity UUID

An XrUuidEXT is generated by the runtime when it creates a spatial entity, and the runtime **must** guarantee the UUID refers to the same spatial entity for the whole life of the spatial entity. For spatial entities that are persisted, the runtime **must** guarantee the UUID remain unchanged across application sessions.

The xrGetSpatialEntityUuidBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrGetSpatialEntityUuidBD(
    XrSenseDataSnapshotBD                       snapshot,
    XrSpatialEntityIdBD                         entityId,
    XrUuidEXT*                                  uuid);
```

Parameter Descriptions

- `snapshot` is the XrSenseDataSnapshotBD handle.
- `entityId` is the XrSpatialEntityIdBD of a spatial entity.
- `uuid` is an output parameter XrUuidEXT pointer to the spatial entity's UUID.

Applications **can** get the UUID for a given spatial entity by calling xrGetSpatialEntityUuidBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrGetSpatialEntityUuidBD
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle
- `uuid` **must** be a pointer to an XrUuidEXT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ENTITY_ID_INVALID_BD`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

12.92.9. Get Sense Data Info

The xrGetQueriedSenseDataBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrGetQueriedSenseDataBD(
    XrSenseDataSnapshotBD                       snapshot,
    XrQueriedSenseDataGetInfoBD*                getInfo,
    XrQueriedSenseDataBD*                       queriedSenseData);
```

Parameter Descriptions

- `snapshot` is the XrSenseDataSnapshotBD.
- `getInfo` is a pointer to the XrQueriedSenseDataGetInfoBD.
- `queriedSenseData` is a pointer to the XrQueriedSenseDataBD.

The application **can** get queried sense data from the XrSenseDataSnapshotBD using xrGetQueriedSenseDataBD. `queriedSenseData` contains an application-allocated array that is populated by the runtime, after capacity negotiation using the two-call idiom, with entity ID, UUID, and last update times for each entity in the snapshot.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to calling xrGetQueriedSenseDataBD
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle
- `getInfo` **must** be a pointer to an XrQueriedSenseDataGetInfoBD structure
- `queriedSenseData` **must** be a pointer to an XrQueriedSenseDataBD structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrQueriedSenseDataGetInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrQueriedSenseDataGetInfoBD {
    XrStructureType    type;
    const void*        next;
} XrQueriedSenseDataGetInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrQueriedSenseDataGetInfoBD
- `type` **must** be `XR_TYPE_QUERIED_SENSE_DATA_GET_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrQueriedSenseDataBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrQueriedSenseDataBD {
    XrStructureType            type;
    void*                      next;
    uint32_t                   stateCapacityInput;
    uint32_t                   stateCountOutput;
    XrSpatialEntityStateBD*    states;
} XrQueriedSenseDataBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `stateCapacityInput` is the capacity of the `states` array, or 0 to indicate a request to retrieve the required capacity.
- `stateCountOutput` is a pointer to the count of `states` written, or a pointer to the required capacity in the case that `stateCapacityInput` is insufficient.
- `states` is an array of XrSpatialEntityStateBD filled in by the runtime, specifying the spatial entities in the snapshot.
- See Buffer Size Parameters chapter for a detailed description of retrieving the required `states` size.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrQueriedSenseDataBD
- type **must** be XR_TYPE_QUERIED_SENSE_DATA_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If stateCapacityInput is not 0, states **must** be a pointer to an array of stateCapacityInput XrSpatialEntityStateBD structures

The XrSpatialEntityStateBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityStateBD {
    XrStructureType        type;
    void*                  next;
    XrSpatialEntityIdBD    entityId;
    XrTime                 lastUpdateTime;
    XrUuidEXT              uuid;
} XrSpatialEntityStateBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- entityId is the XrSpatialEntityIdBD of a spatial entity.
- lastUpdateTime is the last XrTime timestamp at which any of the spatial entity's component data was updated.
- uuid is the XrUuidEXT of the spatial entity.

The XrSpatialEntityStateBD contains the general info of the spatial entity.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSpatialEntityStateBD
- type **must** be XR_TYPE_SPATIAL_ENTITY_STATE_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.92.10. Spatial Entity Component Type

A spatial entity **may** have several components which provide different data for the entity.

The xrEnumerateSpatialEntityComponentTypesBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrEnumerateSpatialEntityComponentTypesBD(
    XrSenseDataSnapshotBD                       snapshot,
    XrSpatialEntityIdBD                         entityId,
    uint32_t                                    componentTypeCapacityInput,
    uint32_t*                                   componentTypeCountOutput,
    XrSpatialEntityComponentTypeBD*             componentTypes);
```

Parameter Descriptions

- `snapshot` is the XrSenseDataSnapshotBD handle.
- `entityId` is the `XrSpatialEntityIdBD` whose spatial entity component types will be enumerated.
- `componentTypeCapacityInput` is the capacity of the `componentTypes` array, or 0 to indicate a request to retrieve the required capacity.
- `componentTypeCountOutput` is the number of component types, or the required capacity in the case that `componentTypeCapacityInput` is insufficient.
- `componentTypes` is an array of XrSpatialEntityComponentTypeBD. It **can** be `NULL` if `componentTypeCapacityInput` is 0.
- See Buffer Size Parameters chapter for a detailed description of retrieving the required `componentTypes` size.

The application inspects the component types for a given `XrSpatialEntityIdBD` using xrEnumerateSpatialEntityComponentTypesBD. The application **may** skip enumerating component types and proceed directly to attempting to access component data.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrEnumerateSpatialEntityComponentTypesBD
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle
- `componentTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `componentTypeCapacityInput` is not `0`, `componentTypes` **must** be a pointer to an array of `componentTypeCapacityInput` XrSpatialEntityComponentTypeBD values

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_SPATIAL_ENTITY_ID_INVALID_BD`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialEntityComponentTypeBD enumeration identifies the different types of components that spatial entities **may** support.

```
// Provided by XR_BD_spatial_sensing
typedef enum XrSpatialEntityComponentTypeBD {
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_LOCATION_BD = 0,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_SEMANTIC_BD = 1,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_2D_BD = 2,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_POLYGON_BD = 3,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_3D_BD = 4,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_TRIANGLE_MESH_BD = 5,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_SPHERE_BD = 6,
  // Provided by XR_BD_spatial_plane
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_PLANE_ORIENTATION_BD = 1000396000,
  // Provided by XR_BD_dynamic_object_tracking
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_DYNAMIC_OBJECT_BD = 1000746000,
    XR_SPATIAL_ENTITY_COMPONENT_TYPE_MAX_ENUM_BD = 0x7FFFFFFF
} XrSpatialEntityComponentTypeBD;
```

Enum	Description
XR_SPATIAL_ENTITY_COMPONENT_TYPE_LOCATION_BD	The location including position and rotation. Corresponds to component data structure XrSpatialEntityComponentDataLocationBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_SEMANTIC_BD	The semantic label. Corresponds to component data structure XrSpatialEntityComponentDataSemanticBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_2D_BD	The two-dimensional bounding box. Corresponds to component data structure XrSpatialEntityComponentDataBoundingBox2DBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_POLYGON_BD	The two-dimensional polygon. Corresponds to component data structure XrSpatialEntityComponentDataPolygonBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_3D_BD	The three-dimensional bounding box. Corresponds to component data structure XrSpatialEntityComponentDataBoundingBox3DBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_TRIANGLE_MESH_BD	The triangle mesh. Corresponds to component data structure XrSpatialEntityComponentDataTriangleMeshBD.
XR_SPATIAL_ENTITY_COMPONENT_TYPE_SPHERE_BD	The Sphere. Corresponds to component data structure XrSpatialEntityComponentDataSphereBD.

Enum	Description
XR_SPATIAL_ENTITY_COMPONENT_TYPE_PLANE_ORIENTATION_BD	The plane orientation. Corresponds to component data structure XrSpatialEntityComponentDataPlaneOrientationBD. (Added by the XR_BD_spatial_plane extension)
XR_SPATIAL_ENTITY_COMPONENT_TYPE_DYNAMIC_OBJECT_BD	The dynamic object component. Corresponds to component data structure XrSpatialEntityComponentDataDynamicObjectBD. (Added by the XR_BD_dynamic_object_tracking extension)

12.92.11. Get Spatial Entity Component Data

Applications **can** get the spatial entity component data of a given spatial entity.

The xrGetSpatialEntityComponentDataBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrGetSpatialEntityComponentDataBD(
    XrSenseDataSnapshotBD                       snapshot,
    const XrSpatialEntityComponentGetInfoBD*    getInfo,
    XrSpatialEntityComponentDataBaseHeaderBD*   componentData);
```

Parameter Descriptions

- snapshot is the XrSenseDataSnapshotBD handle.
- getInfo is a pointer to the XrSpatialEntityComponentGetInfoBD identifying the component data to retrieve.
- componentData is a pointer to a valid structure based on XrSpatialEntityComponentDataBaseHeaderBD.

The application **can** use xrGetSpatialEntityComponentDataBD to get the component data of a spatial entity.

The runtime **must** return XR_ERROR_VALIDATION_FAILURE if the component type is not present on a given entity.

The XrSpatialEntityComponentGetInfoBD::componentType **must** match the type of the output XrSpatialEntityComponentData* structure passed as componentData when querying certain component data with xrGetSpatialEntityComponentDataBD. Otherwise, the runtime **must** return XR_ERROR_VALIDATION_FAILURE from xrGetSpatialEntityComponentDataBD.

If a given component type requires passing additional input through the XrSpatialEntityComponentGetInfoBD::`next` chain, but that input is not present, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Some component data types (types passed to `componentData`) use the structure form of the two call idiom to populate buffers of variable sizes.

The runtime **must** not change the component data in the snapshot until the snapshot is destroyed.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrGetSpatialEntityComponentDataBD
- `snapshot` **must** be a valid XrSenseDataSnapshotBD handle
- `getInfo` **must** be a pointer to a valid XrSpatialEntityComponentGetInfoBD structure
- `componentData` **must** be a pointer to an XrSpatialEntityComponentDataBaseHeaderBD-based structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_SPATIAL_ENTITY_ID_INVALID_BD`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialEntityComponentGetInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentGetInfoBD {
    XrStructureType                   type;
    const void*                       next;
    XrSpatialEntityIdBD               entityId;
    XrSpatialEntityComponentTypeBD    componentType;
} XrSpatialEntityComponentGetInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `entityId` is the `XrSpatialEntityIdBD` to get the component info.
- `componentType` is the XrSpatialEntityComponentTypeBD to get.

The XrSpatialEntityComponentGetInfoBD is a common structure that is used to get component data for a given component type. For some component types, applications **may** need to chain additional `getInfo` structures on the XrSpatialEntityComponentGetInfoBD::`next` chain, when passing it to the xrGetSpatialEntityComponentDataBD function.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentGetInfoBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_GET_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpatialEntityLocationGetInfoBD
- `componentType` **must** be a valid XrSpatialEntityComponentTypeBD value

The XrSpatialEntityComponentDataBaseHeaderBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataBaseHeaderBD {
    XrStructureType    type;
    void*              next;
} XrSpatialEntityComponentDataBaseHeaderBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrSpatialEntityComponentDataBaseHeaderBD is a base structure that is not intended to be directly used, but forms a basis for specific component info types. All component info structures begin with the elements described in the XrSpatialEntityComponentDataBaseHeaderBD, and a component info pointer **must** be cast to a pointer to XrSpatialEntityComponentDataBaseHeaderBD when passing it to the xrGetSpatialEntityComponentDataBD function.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentDataBaseHeaderBD
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpatialEntityComponentDataBoundingBox2DBD, XrSpatialEntityComponentDataBoundingBox3DBD, XrSpatialEntityComponentDataDynamicObjectBD, XrSpatialEntityComponentDataLocationBD, XrSpatialEntityComponentDataPlaneOrientationBD, XrSpatialEntityComponentDataPolygonBD, XrSpatialEntityComponentDataSemanticBD, XrSpatialEntityComponentDataSphereBD, XrSpatialEntityComponentDataTriangleMeshBD

There are some commonly used component data structures defined in this extension which provide access to different spatial sensing features.

The XrSpatialEntityLocationGetInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityLocationGetInfoBD {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
} XrSpatialEntityLocationGetInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is an XrSpace within which the spatial entity will be located.

Chaining this struct to XrSpatialEntityComponentGetInfoBD::`next` is required when querying certain component data with xrGetSpatialEntityComponentDataBD. Otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` from xrGetSpatialEntityComponentDataBD. See the `XrSpatialEntityComponentData*` struct details for more information which components require this struct to be chained.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityLocationGetInfoBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_LOCATION_GET_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The XrSpatialEntityComponentDataLocationBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataLocationBD {
    XrStructureType    type;
    void*              next;
    XrSpaceLocation    location;
} XrSpatialEntityComponentDataLocationBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `location` is the XrSpaceLocation structure.

The XrSpatialEntityComponentDataLocationBD is an output struct for getting the location component

data from the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of XR_SPATIAL_ENTITY_COMPONENT_TYPE_LOCATION_BD. The application **must** chain XrSpatialEntityLocationGetInfoBD to XrSpatialEntityComponentGetInfoBD::next when querying XrSpatialEntityComponentDataLocationBD. Otherwise, the runtime **must** return XR_ERROR_VALIDATION_FAILURE from xrGetSpatialEntityComponentDataBD.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSpatialEntityComponentDataLocationBD
- type **must** be XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_LOCATION_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- location **must** be a valid XrSpaceLocation structure

The XrSpatialEntityComponentDataSemanticBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataSemanticBD {
    XrStructureType       type;
    void*                 next;
    uint32_t              labelCapacityInput;
    uint32_t              labelCountOutput;
    XrSemanticLabelBD*    labels;
} XrSpatialEntityComponentDataSemanticBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- labelCapacityInput is the capacity of the labels array, or 0 to indicate a request to retrieve the required capacity.
- labelCountOutput is the number of semantic labels, or the required capacity in the case that labelCapacityInput is insufficient.
- labels is an array of XrSemanticLabelBD. It **can** be NULL if labelCapacityInput is 0.
- See Buffer Size Parameters chapter for a detailed description of retrieving the required labels size.

The XrSpatialEntityComponentDataSemanticBD is an output struct for getting the semantic labels

component data from an entity in the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of XR_SPATIAL_ENTITY_COMPONENT_TYPE_SEMANTIC_BD.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSpatialEntityComponentDataSemanticBD
- type **must** be XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_SEMANTIC_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If labelCapacityInput is not 0, labels **must** be a pointer to an array of labelCapacityInput XrSemanticLabelBD values

Specify the semantic labels of spatial entity.

```
// Provided by XR_BD_spatial_sensing
typedef enum XrSemanticLabelBD {
    XR_SEMANTIC_LABEL_UNKNOWN_BD = 0,
    XR_SEMANTIC_LABEL_FLOOR_BD = 1,
    XR_SEMANTIC_LABEL_CEILING_BD = 2,
    XR_SEMANTIC_LABEL_WALL_BD = 3,
    XR_SEMANTIC_LABEL_DOOR_BD = 4,
    XR_SEMANTIC_LABEL_WINDOW_BD = 5,
    XR_SEMANTIC_LABEL_OPENING_BD = 6,
    XR_SEMANTIC_LABEL_TABLE_BD = 7,
    XR_SEMANTIC_LABEL_SOFA_BD = 8,
    XR_SEMANTIC_LABEL_CHAIR_BD = 9,
    XR_SEMANTIC_LABEL_HUMAN_BD = 10,
    XR_SEMANTIC_LABEL_BEAM_BD = 11,
    XR_SEMANTIC_LABEL_COLUMN_BD = 12,
    XR_SEMANTIC_LABEL_CURTAIN_BD = 13,
    XR_SEMANTIC_LABEL_CABINET_BD = 14,
    XR_SEMANTIC_LABEL_BED_BD = 15,
    XR_SEMANTIC_LABEL_PLANT_BD = 16,
    XR_SEMANTIC_LABEL_SCREEN_BD = 17,
    XR_SEMANTIC_LABEL_VIRTUAL_WALL_BD = 18,
    XR_SEMANTIC_LABEL_REFRIGERATOR_BD = 19,
    XR_SEMANTIC_LABEL_WASHING_MACHINE_BD = 20,
    XR_SEMANTIC_LABEL_AIR_CONDITIONER_BD = 21,
    XR_SEMANTIC_LABEL_LAMP_BD = 22,
    XR_SEMANTIC_LABEL_WALL_ART_BD = 23,
    XR_SEMANTIC_LABEL_STAIRWAY_BD = 24,
    XR_SEMANTIC_LABEL_MAX_ENUM_BD = 0x7FFFFFFF
} XrSemanticLabelBD;
```

Enum	Description
XR_SEMANTIC_LABEL_UNKNOWN_BD	Semantic label that the runtime does not know.
XR_SEMANTIC_LABEL_FLOOR_BD	Semantic label of floor.
XR_SEMANTIC_LABEL_CEILING_BD	Semantic label of ceiling.
XR_SEMANTIC_LABEL_WALL_BD	Semantic label of wall.
XR_SEMANTIC_LABEL_DOOR_BD	Semantic label of door.
XR_SEMANTIC_LABEL_WINDOW_BD	Semantic label of window.
XR_SEMANTIC_LABEL_OPENING_BD	Semantic label of opening, usually refers to a space that something or someone can pass through.
XR_SEMANTIC_LABEL_TABLE_BD	Semantic label of table.
XR_SEMANTIC_LABEL_SOFA_BD	Semantic label of sofa, usually refers to a seat that multiple people can sit on.
XR_SEMANTIC_LABEL_CHAIR_BD	Semantic label of chair, usually refers to a seat that for one person.
XR_SEMANTIC_LABEL_HUMAN_BD	Semantic label of human.
XR_SEMANTIC_LABEL_BEAM_BD	Semantic label of beam, which usually supports weight in a building or other structure.
XR_SEMANTIC_LABEL_COLUMN_BD	Semantic label of column, which is vertical and used as a support for the roof of a building.
XR_SEMANTIC_LABEL_CURTAIN_BD	Semantic label of curtain.
XR_SEMANTIC_LABEL_CABINET_BD	Semantic label of cabinet.
XR_SEMANTIC_LABEL_BED_BD	Semantic label of bed.
XR_SEMANTIC_LABEL_PLANT_BD	Semantic label of plant.
XR_SEMANTIC_LABEL_SCREEN_BD	Semantic label of screen.
XR_SEMANTIC_LABEL_VIRTUAL_WALL_BD	Semantic label of virtual wall, which is generated by the system scene capture app in order to create a closed space for users.
XR_SEMANTIC_LABEL_REFRIGERATOR_BD	Semantic label of refrigerator.
XR_SEMANTIC_LABEL_WASHING_MACHINE_BD	Semantic label of washing machine.
XR_SEMANTIC_LABEL_AIR_CONDITIONER_BD	Semantic label of air conditioner.
XR_SEMANTIC_LABEL_LAMP_BD	Semantic label of lamp.
XR_SEMANTIC_LABEL_WALL_ART_BD	Semantic label of wall art, like a painting or a photo frame.

Enum	Description
XR_SEMANTIC_LABEL_STAIRWAY_BD	Semantic label of stairway.

The XrSpatialEntityComponentDataBoundingBox2DBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataBoundingBox2DBD {
    XrStructureType    type;
    void*              next;
    XrRect2Df          boundingBox2D;
} XrSpatialEntityComponentDataBoundingBox2DBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- boundingBox2D is an XrRect2Df defining the offset and extent of the bounding box along the x-axis (width) and y-axis (height).

The XrSpatialEntityComponentDataBoundingBox2DBD is an output struct for getting the bounding box 2D component data from the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_2D_BD.

The x-axis and y-axis that describe boundingBox2D are defined by the spatial entity's coordinate space.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSpatialEntityComponentDataBoundingBox2DBD
- type **must** be XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_BOUNDING_BOX_2D_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrSpatialEntityComponentDataPolygonBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataPolygonBD {
    XrStructureType    type;
    void*              next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector2f*        vertices;
} XrSpatialEntityComponentDataPolygonBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCapacityInput` is the capacity of the `vertices` array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is the number of elements populated in the `vertices` array, or the required capacity in the case that `vertexCapacityInput` is insufficient.
- `vertices` is an array of XrVector2f. It **can** be `NULL` if `vertexCapacityInput` is 0.
- See Buffer Size Parameters chapter for a detailed description of retrieving the required `vertices` size.

The XrSpatialEntityComponentDataPolygonBD is an output struct for getting the polygon component data from an entity in the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of `XR_SPATIAL_ENTITY_COMPONENT_TYPE_POLYGON_BD`.

The `vertices` is a list of vertices described on the XY plane, which is defined by the spatial entity's coordinate space.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentDataPolygonBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_POLYGON_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `vertexCapacityInput` is not `0`, `vertices` **must** be a pointer to an array of `vertexCapacityInput` XrVector2f structures

The XrSpatialEntityComponentDataBoundingBox3DBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataBoundingBox3DBD {
    XrStructureType    type;
    void*              next;
    XrBoxf             boundingBox3D;
} XrSpatialEntityComponentDataBoundingBox3DBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `boundingBox3D` is an XrBoxf defining the center position and orientation and the extent of a bounding box 3D relative to its spatial entity's location.

The XrSpatialEntityComponentDataBoundingBox3DBD is an output struct for getting the bounding box 3D component data from an entity in the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of `XR_SPATIAL_ENTITY_COMPONENT_TYPE_BOUNDING_BOX_3D_BD`.

The x-axis, y-axis, and z-axis that describe `boundingBox3D` are defined by the spatial entity's coordinate space.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentDataBoundingBox3DBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_BOUNDING_BOX_3D_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSpatialEntityComponentDataSphereBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataSphereBD {
    XrStructureType    type;
    void*              next;
    XrSpheref          sphere;
} XrSpatialEntityComponentDataSphereBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `sphere` is an XrSpheref defining the center position and orientation and the radius of a sphere bounds relative to the spatial entity.

The XrSpatialEntityComponentDataSphereBD is an output struct for getting the sphere component data from an entity in the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of `XR_SPATIAL_ENTITY_COMPONENT_TYPE_SPHERE_BD`.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentDataSphereBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_SPHERE_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSpatialEntityComponentDataTriangleMeshBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityComponentDataTriangleMeshBD {
    XrStructureType    type;
    void*              next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector3f*        vertices;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    uint16_t*          indices;
} XrSpatialEntityComponentDataTriangleMeshBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCapacityInput` is the capacity of the `vertices` array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is the number of elements populated in the `vertices` array, or the required capacity in the case that `vertexCapacityInput` is insufficient.
- `vertices` is an array of XrVector3f. It **can** be `NULL` if `vertexCapacityInput` is 0.
- `indexCapacityInput` is the capacity of the `indices` array, or 0 to indicate a request to retrieve the required capacity.
- `indexCountOutput` is the number of elements in the `indices` array, or the required capacity in the case that `indexCapacityInput` is insufficient.
- `indices` is an array of indices. It **can** be `NULL` if `indexCapacityInput` is 0.
- See Buffer Size Parameters chapter for a detailed description of retrieving the required `vertices` and `indices` size.

The XrSpatialEntityComponentDataTriangleMeshBD is an output struct for getting the triangle mesh component data from the snapshot. This corresponds to an XrSpatialEntityComponentTypeBD value of `XR_SPATIAL_ENTITY_COMPONENT_TYPE_TRIANGLE_MESH_BD`.

The `vertices` array is a list of vertices described by the spatial entity's coordinate space. The triangle vertices are in counter-clockwise order as viewed from the user perspective.

The `indices` array defines the topology of the triangle mesh. Each triplet of consecutive elements points to three vertices in the `vertices` array and thus form a triangle.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrSpatialEntityComponentDataTriangleMeshBD
- `type` **must** be `XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_TRIANGLE_MESH_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `vertexCapacityInput` is not `0`, `vertices` **must** be a pointer to an array of `vertexCapacityInput` XrVector3f structures
- If `indexCapacityInput` is not `0`, `indices` **must** be a pointer to an array of `indexCapacityInput` `uint16_t` values

12.92.12. Get Sense Data Update Event

The XrEventDataSenseDataUpdatedBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrEventDataSenseDataUpdatedBD {
    XrStructureType          type;
    const void*              next;
    XrSenseDataProviderBD    provider;
} XrEventDataSenseDataUpdatedBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `provider` is the XrSenseDataProviderBD in which the sense data updated.

When the application receives this event, it means one of the sense data providers has updated sense data, and the application **can** initiate a new query request to this sense data provider to get the latest sense data, as a new XrSenseDataSnapshotBD. This is the recommended way to get updated data. The application **may** initiate a new query request even without receiving this event, but the sense data provider **may** not have acquired new data and therefore the contents of the snapshot **may** be functionally identical.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrEventDataSenseDataUpdatedBD
- `type` **must** be `XR_TYPE_EVENT_DATA_SENSE_DATA_UPDATED_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.92.13. Stop Sense Data Provider

The xrStopSenseDataProviderBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrStopSenseDataProviderBD(
    XrSenseDataProviderBD                       provider);
```

Parameter Descriptions

- `provider` is the XrSenseDataProviderBD to stop.

The application **can** stop a sense data provider using xrStopSenseDataProviderBD if it no longer needs to obtain new sense data from the sense data provider. Stopping the provider **must** not affect the usage of existing valid XrSenseDataSnapshotBD handles and their corresponding entity IDs.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrStopSenseDataProviderBD
- `provider` **must** be a valid XrSenseDataProviderBD handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`
- `XR_ERROR_VALIDATION_FAILURE`

12.92.14. Destroy Sense Data Provider

The xrDestroySenseDataProviderBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrDestroySenseDataProviderBD(
    XrSenseDataProviderBD                       provider);
```

Parameter Descriptions

- `provider` is the XrSenseDataProviderBD to destroy.

The application **should** destroy a sense data provider using xrDestroySenseDataProviderBD to release the resources related to it.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrDestroySenseDataProviderBD
- `provider` **must** be a valid XrSenseDataProviderBD handle

Thread Safety

- Access to `provider`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`

12.92.15. Anchor

The XrAnchorBD handle is defined as:

```
// Provided by XR_BD_spatial_sensing
XR_DEFINE_HANDLE(XrAnchorBD)
```

An anchor is bound to a point in the real physical world, or to a spatial entity.

The XrAnchorBD handle is alive until it is explicitly destroyed or the XrSenseDataProviderBD is destroyed.

Create an Anchor from a Spatial Entity

The xrCreateSpatialEntityAnchorBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrCreateSpatialEntityAnchorBD(
    XrSenseDataProviderBD                          provider,
    const XrSpatialEntityAnchorCreateInfoBD*       createInfo,
    XrAnchorBD*                                    anchor);
```

Parameter Descriptions

- `provider` is the XrSenseDataProviderBD.
- `createInfo` is a pointer to the XrSpatialEntityAnchorCreateInfoBD.
- `anchor` is a pointer to the created XrAnchorBD handle.

Some spatial entities **may** have frequently changing poses, requiring real-time acquisition of their poses. The application **can** create the XrAnchorBD handle bound to the spatial entity through xrCreateSpatialEntityAnchorBD, and then create the XrSpace from it using xrCreateAnchorSpaceBD, so that the application **can** obtain its latest pose in real time through xrLocateSpace or xrLocateSpaces.

This function is not supported for all types of sense data providers. Whether this is supported in a type of sense data provider will be explained in the extension that defines the specific type of sense data provider. Otherwise, the runtime **must** return `XR_ERROR_ANCHOR_NOT_SUPPORTED_FOR_ENTITY_BD`.

This handle and associated handles continue to be valid and usable even if the XrSenseDataSnapshotBD used at its creation has since been destroyed.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrCreateSpatialEntityAnchorBD
- `provider` **must** be a valid XrSenseDataProviderBD handle
- `createInfo` **must** be a pointer to a valid XrSpatialEntityAnchorCreateInfoBD structure
- `anchor` **must** be a pointer to an XrAnchorBD handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialEntityAnchorCreateInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrSpatialEntityAnchorCreateInfoBD {
    XrStructureType          type;
    const void*              next;
    XrSenseDataSnapshotBD    snapshot;
    XrSpatialEntityIdBD      entityId;
} XrSpatialEntityAnchorCreateInfoBD;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- snapshot is the XrSenseDataSnapshotBD handle.
- entityId is the XrSpatialEntityIdBD to create from.

Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to using XrSpatialEntityAnchorCreateInfoBD
- type **must** be XR_TYPE_SPATIAL_ENTITY_ANCHOR_CREATE_INFO_BD
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- snapshot **must** be a valid XrSenseDataSnapshotBD handle

12.92.16. Get Anchor UUID

The xrGetAnchorUuidBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrGetAnchorUuidBD(
    XrAnchorBD                                  anchor,
    XrUuidEXT*                                  uuid);
```

Parameter Descriptions

- anchor is the XrAnchorBD handle.
- uuid is a pointer to the XrUuid.

The application **can** get the anchor UUID using xrGetAnchorUuidBD. If the XrAnchorBD is created from a spatial entity, the anchor's UUID is the same as the spatial entity's UUID. .Valid Usage (Implicit)

- The XR_BD_spatial_sensing extension **must** be enabled prior to calling xrGetAnchorUuidBD
- anchor **must** be a valid XrAnchorBD handle
- uuid **must** be a pointer to an XrUuidEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

12.92.17. Locate an Anchor with Anchor Spaces

Locating an anchor relative to a base space is performed similarly to locating other spatial objects: through use of an XrSpace handle and functions like xrLocateSpace and xrLocateSpaces. To locate an anchor in a base space, first create an XrSpace handle for that anchor using xrCreateAnchorSpaceBD.

The xrCreateAnchorSpaceBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrCreateAnchorSpaceBD(
    XrSession                                   session,
    const XrAnchorSpaceCreateInfoBD*            createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- session is a handle to the parent XrSession.
- createInfo is a pointer to an XrAnchorSpaceCreateInfoBD structure containing information about how to create the anchor.
- space is a pointer to a handle in which the created XrSpace is returned.

The application **can** create an XrSpace for an anchor using xrCreateAnchorSpaceBD. Using this handle,

the application **can** use calls like xrLocateSpace and xrLocateSpaces to locate the anchor in a given base space at a given time. The `createInfo` parameter contains the XrAnchorBD as well as a pose offset to apply.

Multiple XrSpace handles for a given XrAnchorBD **may** exist simultaneously, up to some limit imposed by the runtime. The XrSpace handle **must** be eventually freed via the xrDestroySpace function or by destroying the parent XrSession handle.

As the parent of all XrSpace handles, including those created with this function, is an XrSession handle, an anchor space **may** outlive the XrAnchorBD handle used to create it. Additionally, the ability to locate anchor spaces depends on spatial sensing being active. A valid XrSpace handle created for an XrAnchorBD **must** be unlocatable unless the associated XrSenseDataProviderBD has been started without since being stopped.

Such an unlocatable anchor space behaves the same as an unlocatable action space as discussed in Action Spaces Lifetime.

Note that destroying the XrAnchorBD used in creating an anchor space does not itself make the anchor space unlocatable; it only prevents creation of additional anchor spaces from that anchor. This mirrors the behavior of action spaces and destruction of their corresponding pose actions.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrCreateAnchorSpaceBD
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrAnchorSpaceCreateInfoBD structure
- `space` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD
- XR_ERROR_VALIDATION_FAILURE

The XrAnchorSpaceCreateInfoBD structure is defined as:

```
// Provided by XR_BD_spatial_sensing
typedef struct XrAnchorSpaceCreateInfoBD {
    XrStructureType    type;
    const void*        next;
    XrAnchorBD         anchor;
    XrPosef            poseInAnchorSpace;
} XrAnchorSpaceCreateInfoBD;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `anchor` is a handle to an XrAnchorBD.
- `poseInAnchorSpace` is an XrPosef describing the pose of the new space's origin relative to the pose of the anchor.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to using XrAnchorSpaceCreateInfoBD
- `type` **must** be `XR_TYPE_ANCHOR_SPACE_CREATE_INFO_BD`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `anchor` **must** be a valid XrAnchorBD handle

12.92.18. Destroy an Anchor

The xrDestroyAnchorBD function is defined as:

```
// Provided by XR_BD_spatial_sensing
XrResult xrDestroyAnchorBD(
    XrAnchorBD                                  anchor);
```

Parameter Descriptions

- `anchor` is the XrAnchorBD handle.

The application **can** destroy an anchor using xrDestroyAnchorBD.

Valid Usage (Implicit)

- The `XR_BD_spatial_sensing` extension **must** be enabled prior to calling xrDestroyAnchorBD
- `anchor` **must** be a valid XrAnchorBD handle

Thread Safety

- Access to `anchor`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPATIAL_SENSING_SERVICE_UNAVAILABLE_BD`

12.92.19. New Base Types

- `XrSpatialEntityIdBD`

12.92.20. New Object Types

- XrAnchorBD
- XrSenseDataProviderBD
- XrSenseDataSnapshotBD

12.92.21. New Commands

- xrCreateAnchorSpaceBD
- xrCreateSenseDataProviderBD
- xrCreateSpatialEntityAnchorBD
- xrDestroyAnchorBD
- xrDestroySenseDataProviderBD
- xrDestroySenseDataSnapshotBD
- xrEnumerateSpatialEntityComponentTypesBD
- xrGetAnchorUuidBD
- xrGetQueriedSenseDataBD

- xrGetSenseDataProviderStateBD
- xrGetSpatialEntityComponentDataBD
- xrGetSpatialEntityUuidBD
- xrQuerySenseDataAsyncBD
- xrQuerySenseDataCompleteBD
- xrStartSenseDataProviderAsyncBD
- xrStartSenseDataProviderCompleteBD
- xrStopSenseDataProviderBD

12.92.22. New Structures

- XrAnchorSpaceCreateInfoBD
- XrEventDataSenseDataProviderStateChangedBD
- XrEventDataSenseDataUpdatedBD
- XrQueriedSenseDataBD
- XrQueriedSenseDataGetInfoBD
- XrSenseDataProviderCreateInfoBD
- XrSenseDataProviderStartInfoBD
- XrSenseDataQueryCompletionBD

- XR_TYPE_SPATIAL_ENTITY_COMPONENT_DATA_TRIANGLE_MESH_BD
- XR_TYPE_SPATIAL_ENTITY_COMPONENT_GET_INFO_BD
- XR_TYPE_SPATIAL_ENTITY_LOCATION_GET_INFO_BD
- XR_TYPE_SPATIAL_ENTITY_STATE_BD
- XR_TYPE_SYSTEM_SPATIAL_SENSING_PROPERTIES_BD

12.92.25. Sample Code

Create sense data provider & query component data

The following example code demonstrates how to create and start spatial sense data provider for capability "Foo", as well as how to query its component "Bar" data.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrCreateSenseDataProviderBD xrCreateSenseDataProviderBD;                    //
previously initialized
PFN_xrStartSenseDataProviderAsyncBD xrStartSenseDataProviderAsyncBD;            //
previously initialized
PFN_xrStartSenseDataProviderCompleteBD xrStartSenseDataProviderCompleteBD;      //
previously initialized
PFN_xrStopSenseDataProviderBD xrStopSenseDataProviderBD;                        //
previously initialized
PFN_xrDestroySenseDataProviderBD xrDestroySenseDataProviderBD;                  //
previously initialized
PFN_xrQuerySenseDataAsyncBD xrQuerySenseDataAsyncBD;                            //
previously initialized
PFN_xrQuerySenseDataCompleteBD xrQuerySenseDataCompleteBD;                      //
previously initialized
```

```
PFN_xrGetSenseDataProviderStateBD xrGetSenseDataProviderStateBD;                    //
previously initialized
PFN_xrGetQueriedSenseDataBD xrGetQueriedSenseDataBD;                                //
previously initialized
PFN_xrEnumerateSpatialEntityComponentTypesBD xrEnumerateSpatialEntityComponentTypesBD; //
previously initialized
PFN_xrGetSpatialEntityComponentDataBD xrGetSpatialEntityComponentDataBD;            //
previously initialized

12.93.1. Overview

This extension defines the interaction profile for PICO Ultra Controllers.

Interaction profile path for PICO Ultra Controllers:

- */interaction_profiles/bytedance/pico_ultra_controller_bd*

Valid for user paths for pico_ultra_controller_bd:

- */user/hand/left*
- */user/hand/right*

Supported component paths for pico_ultra_controller_bd:

- On /user/hand/left only:
  - *.../input/x/click*
  - *.../input/x/touch*
  - *.../input/y/click*
  - *.../input/y/touch*
  - *.../input/menu/click*
- On /user/hand/right only:
  - *.../input/a/click*
  - *.../input/a/touch*
  - *.../input/b/click*
  - *.../input/b/touch*
- *.../input/system/click* (**may** not be available for application use)
- *.../input/trigger/click*
- *.../input/trigger/value*
- *.../input/trigger/touch*
- *.../input/thumbstick/y*
- *.../input/thumbstick/x*
- *.../input/thumbstick/click*
- *.../input/thumbstick/touch*
- *.../input/squeeze/click*
- *.../input/squeeze/value*
- *.../input/grip/pose*
- *.../input/grip_surface/pose*
- *.../input/aim/pose*
- *.../output/haptic*

Be careful with the following component:

- Ultra Controller support *.../input/menu/click* only on */user/hand/left*.

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

Overview

This extension allows the application to retrieve the recommended and maximum field-of-view using xrEnumerateViewConfigurationViews. These field-of-view parameters can be used during initialization of the application before creating a session.

The field-of-view given here **should** not be used for rendering, see xrLocateViews to retrieve the field-of-view for rendering.

For views with `fovMutable` set to `XR_TRUE` the maximum field-of-view **should** specify the upper limit that runtime can support. If the view has `fovMutable` set to `XR_FALSE` the runtime **must** set `maxMutableFov` to be the same as `recommendedFov`.

New Object Types

New Flag Types

New Enum Constants

New Enums

New Structures

The XrViewConfigurationViewFovEPIC structure is an output struct which can be added to the next chain of XrViewConfigurationView to retrieve the field-of-view for that view.

```
// Provided by XR_EPIC_view_configuration_fov
typedef struct XrViewConfigurationViewFovEPIC {
    XrStructureType    type;
    const void*        next;
    XrFovf             recommendedFov;
    XrFovf             maxMutableFov;
} XrViewConfigurationViewFovEPIC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `recommendedFov` is the recommended field-of-view based on the current user IPD.
- `maxMutableFov` is the maximum field-of-view that the runtime can display.

Valid Usage (Implicit)

- The `XR_EPIC_view_configuration_fov` extension **must** be enabled prior to using XrViewConfigurationViewFovEPIC
- `type` **must** be `XR_TYPE_VIEW_CONFIGURATION_VIEW_FOV_EPIC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

This extension provides support for the specification of Android Surface specific swapchain create flags.

These additional create flags are specified by attaching a XrAndroidSurfaceSwapchainCreateInfoFB structure to the `next` chain of an XrSwapchainCreateInfo structure.

New Object Types

New Flag Types

```
// Provided by XR_FB_android_surface_swapchain_create
typedef XrFlags64 XrAndroidSurfaceSwapchainFlagsFB;
```

```
// Provided by XR_FB_android_surface_swapchain_create
// Flag bits for XrAndroidSurfaceSwapchainFlagsFB
static const XrAndroidSurfaceSwapchainFlagsFB
XR_ANDROID_SURFACE_SWAPCHAIN_SYNCHRONOUS_BIT_FB = 0x00000001;
static const XrAndroidSurfaceSwapchainFlagsFB
XR_ANDROID_SURFACE_SWAPCHAIN_USE_TIMESTAMPS_BIT_FB = 0x00000002;
```

Flag Descriptions

- XR_ANDROID_SURFACE_SWAPCHAIN_SYNCHRONOUS_BIT_FB indicates the underlying BufferQueue should be created in synchronous mode, allowing multiple buffers to be queued instead of always replacing the last buffer. Buffers are retired in order, and the producer may block until a new buffer is available.
- XR_ANDROID_SURFACE_SWAPCHAIN_USE_TIMESTAMPS_BIT_FB indicates the compositor should acquire the most recent buffer whose presentation timestamp is not greater than the expected display time of the final composited frame.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_ANDROID_SURFACE_SWAPCHAIN_CREATE_INFO_FB

New Enums

- XR_ANDROID_SURFACE_SWAPCHAIN_SYNCHRONOUS_BIT_FB
- XR_ANDROID_SURFACE_SWAPCHAIN_USE_TIMESTAMPS_BIT_FB

New Structures

The XrAndroidSurfaceSwapchainCreateInfoFB structure is defined as:

```
// Provided by XR_FB_android_surface_swapchain_create
typedef struct XrAndroidSurfaceSwapchainCreateInfoFB {
    XrStructureType                       type;
    const void*                           next;
    XrAndroidSurfaceSwapchainFlagsFB      createFlags;
} XrAndroidSurfaceSwapchainCreateInfoFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- createFlags is 0 or one or more XrAndroidSurfaceSwapchainFlagBitsFB which indicate various characteristics desired for the Android Surface Swapchain.

XrAndroidSurfaceSwapchainCreateInfoFB contains additional Android Surface specific create flags when calling xrCreateSwapchainAndroidSurfaceKHR. The XrAndroidSurfaceSwapchainCreateInfoFB

structure **must** be provided in the `next` chain of the XrSwapchainCreateInfo structure when calling xrCreateSwapchainAndroidSurfaceKHR.

Valid Usage (Implicit)

- The `XR_FB_android_surface_swapchain_create` extension **must** be enabled prior to using XrAndroidSurfaceSwapchainCreateInfoFB
- `type` **must** be `XR_TYPE_ANDROID_SURFACE_SWAPCHAIN_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `createFlags` **must** be a valid combination of XrAndroidSurfaceSwapchainFlagBitsFB values
- `createFlags` **must** not be `0`

12.96.1. Overview

This extension enables applications to locate the individual body joints that represent the estimated position of the user of the device. It enables applications to render the upper body in XR experiences.

12.96.2. Inspect system capability

An application **can** inspect whether the system is capable of body tracking by extending the XrSystemProperties with XrSystemBodyTrackingPropertiesFB structure when calling xrGetSystemProperties.

```
// Provided by XR_FB_body_tracking
typedef struct XrSystemBodyTrackingPropertiesFB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsBodyTracking;
} XrSystemBodyTrackingPropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsBodyTracking` is an `XrBool32`, indicating if current system is capable of receiving body tracking input.

If a runtime returns `XR_FALSE` for `supportsBodyTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateBodyTrackerFB.

Valid Usage (Implicit)

- The XR_FB_body_tracking extension **must** be enabled prior to using XrSystemBodyTrackingPropertiesFB
- type **must** be XR_TYPE_SYSTEM_BODY_TRACKING_PROPERTIES_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.96.3. Create a body tracker handle

The XrBodyTrackerFB handle represents the resources for body tracking.

```
// Provided by XR_FB_body_tracking
XR_DEFINE_HANDLE(XrBodyTrackerFB)
```

This handle **can** be used to locate body joints using xrLocateBodyJointsFB function.

A body tracker provides joint locations with an unobstructed range of human body motion.

It also provides the estimated scale of this body.

An application **can** create an XrBodyTrackerFB handle using xrCreateBodyTrackerFB function.

```
// Provided by XR_FB_body_tracking
XrResult xrCreateBodyTrackerFB(
    XrSession                                   session,
    const XrBodyTrackerCreateInfoFB*            createInfo,
    XrBodyTrackerFB*                            bodyTracker);
```

Parameter Descriptions

- session is an XrSession in which the body tracker will be active.
- createInfo is the XrBodyTrackerCreateInfoFB used to specify the body tracker.
- bodyTracker is the returned XrBodyTrackerFB handle.

If the system does not support body tracking, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrCreateBodyTrackerFB. In this case, the runtime **must** return XR_FALSE for XrSystemBodyTrackingPropertiesFB::supportsBodyTracking when the function xrGetSystemProperties is called, so that the application **can** avoid creating a body tracker.

Valid Usage (Implicit)

- The XR_FB_body_tracking extension **must** be enabled prior to calling xrCreateBodyTrackerFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrBodyTrackerCreateInfoFB structure
- bodyTracker **must** be a pointer to an XrBodyTrackerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrBodyTrackerCreateInfoFB structure describes the information to create an XrBodyTrackerFB handle.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodyTrackerCreateInfoFB {
    XrStructureType     type;
    const void*         next;
    XrBodyJointSetFB    bodyJointSet;
} XrBodyTrackerCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `bodyJointSet` is an XrBodyJointSetFB that describes the set of body joints to retrieve.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to using XrBodyTrackerCreateInfoFB
- `type` **must** be `XR_TYPE_BODY_TRACKER_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `bodyJointSet` **must** be a valid XrBodyJointSetFB value

The XrBodyJointSetFB enum describes the set of body joints to track when creating an XrBodyTrackerFB.

```
// Provided by XR_FB_body_tracking
typedef enum XrBodyJointSetFB {
    XR_BODY_JOINT_SET_DEFAULT_FB = 0,
  // Provided by XR_META_body_tracking_full_body
    XR_BODY_JOINT_SET_FULL_BODY_META = 1000274000,
    XR_BODY_JOINT_SET_MAX_ENUM_FB = 0x7FFFFFFF
} XrBodyJointSetFB;
```

Enumerant Descriptions

- `XR_BODY_JOINT_SET_DEFAULT_FB` — Indicates that the created XrBodyTrackerFB tracks the set of body joints described by XrBodyJointFB enum, i.e. the xrLocateBodyJointsFB function returns an array of joint locations with the count of `XR_BODY_JOINT_COUNT_FB` and can be indexed using XrBodyJointFB. This includes the upper body, both hands, and torso.
- `XR_BODY_JOINT_SET_FULL_BODY_META` — Indicates that the created XrBodyTrackerFB tracks the set of body joints described by XrFullBodyJointMETA enum, i.e. the xrLocateBodyJointsFB function returns an array of joint locations with the count of `XR_FULL_BODY_JOINT_COUNT_META` and can be indexed using XrFullBodyJointMETA. This extends the joints of `XR_BODY_JOINT_SET_DEFAULT_FB` by also including the lower body. (Added by the `XR_META_body_tracking_full_body` extension)

xrDestroyBodyTrackerFB function releases the bodyTracker and the underlying resources when the body tracking experience is over.

```
// Provided by XR_FB_body_tracking
XrResult xrDestroyBodyTrackerFB(
    XrBodyTrackerFB                             bodyTracker);
```

Parameter Descriptions

- bodyTracker is an XrBodyTrackerFB previously created by xrCreateBodyTrackerFB.

Valid Usage (Implicit)

- The XR_FB_body_tracking extension **must** be enabled prior to calling xrDestroyBodyTrackerFB
- bodyTracker **must** be a valid XrBodyTrackerFB handle

Thread Safety

- Access to bodyTracker, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.96.4. Locate body joints

The xrLocateBodyJointsFB function locates an array of body joints to a base space at a given time.

```
// Provided by XR_FB_body_tracking
XrResult xrLocateBodyJointsFB(
    XrBodyTrackerFB                             bodyTracker,
    const XrBodyJointsLocateInfoFB*             locateInfo,
    XrBodyJointLocationsFB*                     locations);
```

Parameter Descriptions

- `bodyTracker` is an XrBodyTrackerFB previously created by xrCreateBodyTrackerFB.
- `locateInfo` is a pointer to XrBodyJointsLocateInfoFB describing information to locate body joints.
- `locations` is a pointer to XrBodyJointLocationsFB receiving the returned body joint locations.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to calling xrLocateBodyJointsFB
- `bodyTracker` **must** be a valid XrBodyTrackerFB handle
- `locateInfo` **must** be a pointer to a valid XrBodyJointsLocateInfoFB structure
- `locations` **must** be a pointer to an XrBodyJointLocationsFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

The XrBodyJointsLocateInfoFB structure describes the information to locate body joints.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodyJointsLocateInfoFB {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
} XrBodyJointsLocateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is an XrSpace within which the returned body joint locations will be represented.
- `time` is an `XrTime` at which to locate the body joints.

Callers **should** request a time equal to the predicted display time for the rendered frame. The system will employ appropriate modeling to support body tracking at this time.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to using XrBodyJointsLocateInfoFB
- `type` **must** be `XR_TYPE_BODY_JOINTS_LOCATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

XrBodyJointLocationsFB structure returns the state of the body joint locations.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodyJointLocationsFB {
    XrStructureType           type;
    void*                     next;
    XrBool32                  isActive;
    float                     confidence;
    uint32_t                  jointCount;
    XrBodyJointLocationFB*    jointLocations;
    uint32_t                  skeletonChangedCount;
    XrTime                    time;
} XrBodyJointLocationsFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `isActive` is an `XrBool32` indicating if the body tracker is actively tracking.
- `confidence` is a `float` between 0 and 1 which represents the confidence for the returned body pose. A value of 0 means there is no confidence in the pose returned, and a value of 1 means maximum confidence in the returned body pose.
- `jointCount` is a `uint32_t` describing the count of elements in `jointLocations` array.
- `jointLocations` is an application-allocated array of XrBodyJointLocationFB that will be filled with joint locations.
- `skeletonChangedCount` is an output `uint32_t` incremental counter indicating that the skeleton scale proportions have changed. xrGetBodySkeletonFB **can** be called when this counter increases to get the latest body proportions/scale.
- `time` is an `XrTime` time at which the returned joints are tracked. Equals the time at which the joints were requested if the interpolation at the time was successful.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `jointCount` does not equal to the number of joints defined by the XrBodyJointSetFB used to create the XrBodyTrackerFB.

The runtime **must** return `jointLocations` representing the range of human body motion, without any obstructions. Input systems that either obstruct the movement of the user's body (for example, a held controller preventing the user from making a fist) or input systems that have only limited ability to track finger positions **must** use the information available to them to emulate an unobstructed range of motion.

The runtime **must** update the `jointLocations` array ordered so that it is indexed using the corresponding body joint enum (e.g. XrBodyJointFB) as described by XrBodyJointSetFB when creating the XrBodyTrackerFB. For example, when the XrBodyTrackerFB is created with `XR_BODY_JOINT_SET_DEFAULT_FB`, the application **must** set the `jointCount` to `XR_BODY_JOINT_COUNT_FB`, and the runtime **must** fill the `jointLocations` array ordered so that it is indexed by the XrBodyJointFB enum.

If the returned `isActive` is true, the runtime **must** return all joint locations with both `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` set. However, in this case, some joint space locations **may** be untracked (i.e. `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` or `XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT` is unset).

If the returned `isActive` is false, it indicates that the body tracker did not detect the body input, the application lost input focus, or the consent for body tracking was denied by the user. In this case, the runtime **must** return all `jointLocations` with neither `XR_SPACE_LOCATION_POSITION_VALID_BIT` nor

XR_SPACE_LOCATION_ORIENTATION_VALID_BIT set.

Valid Usage (Implicit)

- The XR_FB_body_tracking extension **must** be enabled prior to using XrBodyJointLocationsFB
- type **must** be XR_TYPE_BODY_JOINT_LOCATIONS_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrBodyTrackingCalibrationStatusMETA, XrBodyTrackingFidelityStatusMETA

XrBodyJointLocationFB structure describes the position, orientation, and radius of a body joint.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodyJointLocationFB {
    XrSpaceLocationFlags    locationFlags;
    XrPosef                 pose;
} XrBodyJointLocationFB;
```

Member Descriptions

- locationFlags is a bitfield, with bit masks defined in XrSpaceLocationFlagBits, to indicate which members contain valid data. If none of the bits are set, no other fields in this structure **should** be considered to be valid or meaningful.
- pose is an XrPosef defining the position and orientation of the origin of a body joint within the reference frame of the corresponding XrBodyJointsLocateInfoFB::baseSpace.

Valid Usage (Implicit)

- The XR_FB_body_tracking extension **must** be enabled prior to using XrBodyJointLocationFB
- locationFlags **must** be a valid combination of XrSpaceLocationFlagBits values
- locationFlags **must** not be 0

12.96.5. Retrieve body skeleton

The xrGetBodySkeletonFB function returns the body skeleton in T-pose.

```
// Provided by XR_FB_body_tracking
XrResult xrGetBodySkeletonFB(
    XrBodyTrackerFB                             bodyTracker,
    XrBodySkeletonFB*                           skeleton);
```

Parameter Descriptions

- `bodyTracker` is an XrBodyTrackerFB previously created by xrCreateBodyTrackerFB.
- `skeleton` is a pointer to XrBodySkeletonFB receiving the returned body skeleton hierarchy.

This function **can** be used to query the skeleton scale and proportions in conjunction with XrBodyJointLocationsFB::`skeletonChangedCount`. XrBodyJointLocationsFB::`skeletonChangedCount` is incremented whenever the tracking auto-calibrates the user skeleton scale and proportions.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to calling xrGetBodySkeletonFB
- `bodyTracker` **must** be a valid XrBodyTrackerFB handle
- `skeleton` **must** be a pointer to an XrBodySkeletonFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrBodySkeletonFB structure is a container to represent the body skeleton in T-pose including the joint hierarchy.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodySkeletonFB {
    XrStructureType           type;
    void*                     next;
    uint32_t                  jointCount;
    XrBodySkeletonJointFB*    joints;
} XrBodySkeletonFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `jointCount` is an `uint32_t` describing the count of elements in `joints` array.
- `joints` is an application-allocated array of XrBodySkeletonJointFB that will be filled with skeleton joint elements.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `jointCount` does not equal to the number of joints defined by the XrBodyJointSetFB used to create the XrBodyTrackerFB.

The runtime **must** return `joints` representing the default pose of the current estimation regarding the user's skeleton.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to using XrBodySkeletonFB
- `type` **must** be `XR_TYPE_BODY_SKELETON_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `joints` **must** be a pointer to an array of `jointCount` XrBodySkeletonJointFB structures
- The `jointCount` parameter **must** be greater than `0`

XrBodySkeletonJointFB structure describes the position, orientation of the joint in space, and position of the joint in the skeleton hierarchy.

```
// Provided by XR_FB_body_tracking
typedef struct XrBodySkeletonJointFB {
    int32_t    joint;
    int32_t    parentJoint;
    XrPosef    pose;
} XrBodySkeletonJointFB;
```

Member Descriptions

- `joint` is an index of a joint using the corresponding body joint enum (e.g. XrBodyJointFB).
- `parentJoint` is an index of a parent joint of that joint, using the corresponding body joint enum (e.g. XrBodyJointFB).
- `pose` is an XrPosef defining the position and orientation of the origin of a body joint within the reference frame of the corresponding XrBodyJointsLocateInfoFB::`baseSpace`.

Valid Usage (Implicit)

- The `XR_FB_body_tracking` extension **must** be enabled prior to using XrBodySkeletonJointFB

12.96.6. Example code for locating body joints

The following example code demonstrates how to locate all body joints relatively to a base space.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized
XrSpace baseSpace;  // previously initialized, e.g. from
                     // XR_REFERENCE_SPACE_TYPE_LOCAL

// Inspect body tracking system properties
XrSystemBodyTrackingPropertiesFB bodyTrackingSystemProperties{
    .type = XR_TYPE_SYSTEM_BODY_TRACKING_PROPERTIES_FB,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &bodyTrackingSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!bodyTrackingSystemProperties.supportsBodyTracking) {
    // The system does not support body tracking
    return;
```

```
}

// Get function pointer for xrCreateBodyTrackerFB
PFN_xrCreateBodyTrackerFB pfnCreateBodyTrackerFB = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateBodyTrackerFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateBodyTrackerFB)));

// Create a body tracker that tracks default set of body joints.
XrBodyTrackerFB bodyTracker{XR_NULL_HANDLE};
{
    XrBodyTrackerCreateInfoFB createInfo{
        .type = XR_TYPE_BODY_TRACKER_CREATE_INFO_FB,
        .next = nullptr,
        .bodyJointSet = XR_BODY_JOINT_SET_DEFAULT_FB,
    };
    CHK_XR(pfnCreateBodyTrackerFB(session, &createInfo, &bodyTracker));
}

// Allocate buffers to receive joint location data before frame
// loop starts.
XrBodyJointLocationFB jointLocations[XR_BODY_JOINT_COUNT_FB];
XrBodyJointLocationsFB locations{
    .type = XR_TYPE_BODY_JOINT_LOCATIONS_FB,
    .next = nullptr,
    .jointCount = XR_BODY_JOINT_COUNT_FB,
    .jointLocations = jointLocations,
};

// Get function pointer for xrLocateBodyJointsFB.
PFN_xrLocateBodyJointsFB pfnLocateBodyJointsFB = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrLocateBodyJointsFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnLocateBodyJointsFB)));
while (1) {
    // ...
    // For every frame in the frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrBodyJointsLocateInfoFB locateInfo{
        .type = XR_TYPE_BODY_JOINTS_LOCATE_INFO_FB,
        .next = nullptr,
        .baseSpace = baseSpace,
        .time = time,
    };
```

```
    CHK_XR(pfnLocateBodyJointsFB(bodyTracker, &locateInfo, &locations));

    if (locations.isActive) {
        // The returned joint location array is directly indexed with
        // XrBodyJointFB enum.
        const XrPosef &indexTip =
            jointLocations[XR_BODY_JOINT_LEFT_HAND_INDEX_TIP_FB].pose;
    }
}
```

12.96.7. Conventions of body joints

This extension defines 70 joints for body tracking: 18 core body joints + 52 hand joints.

```
// Provided by XR_FB_body_tracking
typedef enum XrBodyJointFB {
    XR_BODY_JOINT_ROOT_FB = 0,
    XR_BODY_JOINT_HIPS_FB = 1,
    XR_BODY_JOINT_SPINE_LOWER_FB = 2,
    XR_BODY_JOINT_SPINE_MIDDLE_FB = 3,
    XR_BODY_JOINT_SPINE_UPPER_FB = 4,
    XR_BODY_JOINT_CHEST_FB = 5,
    XR_BODY_JOINT_NECK_FB = 6,
    XR_BODY_JOINT_HEAD_FB = 7,

    XR_BODY_JOINT_RIGHT_HAND_RING_DISTAL_FB = 63,
    XR_BODY_JOINT_RIGHT_HAND_RING_TIP_FB = 64,
    XR_BODY_JOINT_RIGHT_HAND_LITTLE_METACARPAL_FB = 65,
    XR_BODY_JOINT_RIGHT_HAND_LITTLE_PROXIMAL_FB = 66,
    XR_BODY_JOINT_RIGHT_HAND_LITTLE_INTERMEDIATE_FB = 67,
    XR_BODY_JOINT_RIGHT_HAND_LITTLE_DISTAL_FB = 68,
    XR_BODY_JOINT_RIGHT_HAND_LITTLE_TIP_FB = 69,
    XR_BODY_JOINT_COUNT_FB = 70,
    XR_BODY_JOINT_NONE_FB = -1,
    XR_BODY_JOINT_MAX_ENUM_FB = 0x7FFFFFFF
} XrBodyJointFB;
```

The backward (+Z) direction is parallel to the corresponding bone and points away from the finger tip. The up (+Y) direction is pointing out of the back of and perpendicular to the corresponding finger nail

at the fully opened hand pose. The X direction is perpendicular to Y and Z and follows the right hand rule.

The wrist joint is located at the pivot point of the wrist, which is location invariant when twisting the hand without moving the forearm. The backward (+Z) direction is parallel to the line from wrist joint to middle finger metacarpal joint, and points away from the finger tips. The up (+Y) direction points out towards back of the hand and perpendicular to the skin at wrist. The X direction is perpendicular to the Y and Z directions and follows the right hand rule.

The palm joint is located at the center of the middle finger's metacarpal bone. The backward (+Z) direction is parallel to the middle finger's metacarpal bone, and points away from the finger tips. The up (+Y) direction is perpendicular to palm surface and pointing towards the back of the hand. The X direction is perpendicular to the Y and Z directions and follows the right hand rule.

Body skeleton has the full set of body joints (e.g. defined by XrBodyJointFB), organized in a hierarchy with a default T-shape body pose.

The purpose of the skeleton is to provide data about the body size. Coordinates are relative to each other, so there is no any relation to any space.

The calculation of the body size **may** be updated during a session. Each time the calculation of the size is changed, `skeletonChangedCount` of XrBodyJointLocationsFB is changed to indicate that a new skeleton **may** be retrieved.

Overview

XR devices may use a color space that is different from many monitors used in development. Application developers may desire to specify the color space in which they have authored their application so appropriate colors are shown when the application is running on the XR device.

This extension allows:

- An application to get the native color space of the XR device.
- An application to enumerate the supported color spaces for the session.
- An application to set the color space for the session.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SYSTEM_COLOR_SPACE_PROPERTIES_FB`

XrResult enumeration is extended with:

- `XR_ERROR_COLOR_SPACE_UNSUPPORTED_FB`

New Enums

The possible color spaces are specified by the XrColorSpaceFB enumeration.

```
// Provided by XR_FB_color_space
typedef enum XrColorSpaceFB {
    XR_COLOR_SPACE_UNMANAGED_FB = 0,
    XR_COLOR_SPACE_REC2020_FB = 1,
    XR_COLOR_SPACE_REC709_FB = 2,
    XR_COLOR_SPACE_RIFT_CV1_FB = 3,
    XR_COLOR_SPACE_RIFT_S_FB = 4,
    XR_COLOR_SPACE_QUEST_FB = 5,
    XR_COLOR_SPACE_P3_FB = 6,
    XR_COLOR_SPACE_ADOBE_RGB_FB = 7,
    XR_COLOR_SPACE_MAX_ENUM_FB = 0x7FFFFFFF
} XrColorSpaceFB;
```

Enumerant Descriptions

- XR_COLOR_SPACE_UNMANAGED_FB. No color correction, not recommended for production use.
- XR_COLOR_SPACE_REC2020_FB. Standard Rec. 2020 chromacities with D65 white point.
- XR_COLOR_SPACE_REC709_FB. Standard Rec. 709 chromaticities, similar to sRGB.
- XR_COLOR_SPACE_RIFT_CV1_FB. Unique color space, between P3 and Adobe RGB using D75 white point. This is the preferred color space for standardized color across all Oculus HMDs.

  Color Space Details with Chromacity Primaries in CIE 1931 xy:

  - Red: (0.666, 0.334)
  - Green: (0.238, 0.714)
  - Blue: (0.139, 0.053)
  - White: (0.298, 0.318)
- XR_COLOR_SPACE_RIFT_S_FB. Unique color space. Similar to Rec 709 using D75.

  Color Space Details with Chromacity Primaries in CIE 1931 xy:

  - Red: (0.640, 0.330)
  - Green: (0.292, 0.586)
  - Blue: (0.156, 0.058)
  - White: (0.298, 0.318)
- XR_COLOR_SPACE_QUEST_FB. Unique color space. Similar to Rift CV1 using D75 white point

  Color Space Details with Chromacity Primaries in CIE 1931 xy:

  - Red: (0.661, 0.338)
  - Green: (0.228, 0.718)
  - Blue: (0.142, 0.042)
  - White: (0.298, 0.318)
- XR_COLOR_SPACE_P3_FB. Similar to DCI-P3, but uses D65 white point instead.

  Color Space Details with Chromacity Primaries in CIE 1931 xy:

  - Red: (0.680, 0.320)
  - Green: (0.265, 0.690)
  - Blue: (0.150, 0.060)
  - White: (0.313, 0.329)
- XR_COLOR_SPACE_ADOBE_RGB_FB. Standard Adobe chromacities.

New Structures

An application may inspect the native color space of the system by chaining an XrSystemColorSpacePropertiesFB structure to the XrSystemProperties when calling xrGetSystemProperties.

The XrSystemColorSpacePropertiesFB structure is defined as:

```
// Provided by XR_FB_color_space
typedef struct XrSystemColorSpacePropertiesFB {
    XrStructureType    type;
    void*              next;
    XrColorSpaceFB     colorSpace;
} XrSystemColorSpacePropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `colorSpace` is the native color space of the XR device.

Valid Usage (Implicit)

- The `XR_FB_color_space` extension **must** be enabled prior to using XrSystemColorSpacePropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_COLOR_SPACE_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrEnumerateColorSpacesFB function is defined as:

```
// Provided by XR_FB_color_space
XrResult xrEnumerateColorSpacesFB(
    XrSession                                   session,
    uint32_t                                    colorSpaceCapacityInput,
    uint32_t*                                   colorSpaceCountOutput,
    XrColorSpaceFB*                             colorSpaces);
```

Parameter Descriptions

- `session` is the session that enumerates the supported color spaces.
- `colorSpaceCapacityInput` is the capacity of the `colorSpaces` array, or 0 to retrieve the required capacity.
- `colorSpaceCountOutput` is a pointer to the count of XrColorSpaceFB `colorSpaces` written, or a pointer to the required capacity in the case that `colorSpaceCapacityInput` is insufficient.
- `colorSpaces` is a pointer to an array of XrColorSpaceFB color spaces, but **can** be `NULL` if `colorSpaceCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `colorSpaces` size.

xrEnumerateColorSpacesFB enumerates the color spaces supported by the current session. Runtimes **must** always return identical buffer contents from this enumeration for the lifetime of the session.

Valid Usage (Implicit)

- The `XR_FB_color_space` extension **must** be enabled prior to calling xrEnumerateColorSpacesFB
- `session` **must** be a valid XrSession handle
- `colorSpaceCountOutput` **must** be a pointer to a `uint32_t` value
- If `colorSpaceCapacityInput` is not `0`, `colorSpaces` **must** be a pointer to an array of `colorSpaceCapacityInput` XrColorSpaceFB values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrSetColorSpaceFB function is defined as:

```
// Provided by XR_FB_color_space
XrResult xrSetColorSpaceFB(
    XrSession                                   session,
    const XrColorSpaceFB                        colorSpace);
```

Parameter Descriptions

- session is a valid XrSession handle.
- colorSpace is a supported color space. Supported color spaces are indicated by xrEnumerateColorSpacesFB.

xrSetColorSpaceFB provides a mechanism for an application to specify the color space used in the final rendered frame. If this function is not called, the session will use the color space deemed appropriate by the runtime. Oculus HMDs for both PC and Mobile product lines default to XR_COLOR_SPACE_RIFT_CV1_FB. The runtime **must** return XR_ERROR_COLOR_SPACE_UNSUPPORTED_FB if colorSpace is not one of the values enumerated by xrEnumerateColorSpacesFB.

Formal definitions of color spaces contain a number of aspects such as gamma correction, max luminance and more. However, xrSetColorSpaceFB will only affect the color gamut of the output by transforming the color gamut from the source (defined by the colorSpace parameter) to the HMD display's color gamut (defined by the hardware internally). This call will not affect gamma correction, leaving that to follow the GPU texture format standards. Luminance, tonemapping, and other aspects

of the color space will also remain unaffected.

For more info on color management in Oculus HMDs, please refer to this guide: Color Management in Oculus Headsets

Valid Usage (Implicit)

- The `XR_FB_color_space` extension **must** be enabled prior to calling xrSetColorSpaceFB
- `session` **must** be a valid XrSession handle
- `colorSpace` **must** be a valid XrColorSpaceFB value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_COLOR_SPACE_UNSUPPORTED_FB`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

Overview

This extension provides explicit control over source and destination blend factors, with separate controls for color and alpha. When specified, these blend controls supersede the behavior of `XR_COMPOSITION_LAYER_BLEND_TEXTURE_SOURCE_ALPHA_BIT`, as well as the layer blending operation which defined in the section of Composition Layer Blending.

When `XR_COMPOSITION_LAYER_UNPREMULTIPLIED_ALPHA_BIT` is specified, the source color is unpremultiplied alpha.

Like color, destination alpha is initialized to 0 before composition begins.

These blend factors are specified by attaching a XrCompositionLayerAlphaBlendFB structure to the `next` chain of a layer structure derived from XrCompositionLayerBaseHeader.

Warning

Please note that using this extension is mutually exclusive with accessing an environment blend mode other than XR_ENVIRONMENT_BLEND_MODE_OPAQUE. The latter **must** be the only mode returned from xrEnumerateEnvironmentBlendModes if this extension is enabled. Application **should** not enable this extension if a different value of XrEnvironmentBlendMode is required.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_ALPHA_BLEND_FB

New Enums

The possible blend factors are specified by the XrBlendFactorFB enumeration.

```
// Provided by XR_FB_composition_layer_alpha_blend
typedef enum XrBlendFactorFB {
    XR_BLEND_FACTOR_ZERO_FB = 0,
    XR_BLEND_FACTOR_ONE_FB = 1,
    XR_BLEND_FACTOR_SRC_ALPHA_FB = 2,
    XR_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA_FB = 3,
    XR_BLEND_FACTOR_DST_ALPHA_FB = 4,
    XR_BLEND_FACTOR_ONE_MINUS_DST_ALPHA_FB = 5,
    XR_BLEND_FACTOR_MAX_ENUM_FB = 0x7FFFFFFF
} XrBlendFactorFB;
```

New Structures

The XrCompositionLayerAlphaBlendFB structure is defined as:

```
// Provided by XR_FB_composition_layer_alpha_blend
typedef struct XrCompositionLayerAlphaBlendFB {
    XrStructureType    type;
    void*              next;
    XrBlendFactorFB    srcFactorColor;
    XrBlendFactorFB    dstFactorColor;
    XrBlendFactorFB    srcFactorAlpha;
    XrBlendFactorFB    dstFactorAlpha;
} XrCompositionLayerAlphaBlendFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `srcFactorColor` specifies the source color blend factor.
- `dstFactorColor` specifies the destination color blend factor.
- `srcFactorAlpha` specifies the source alpha blend factor.
- `dstFactorAlpha` specifies the destination alpha blend factor.

XrCompositionLayerAlphaBlendFB provides applications with explicit control over source and destination blend factors.

The XrCompositionLayerAlphaBlendFB structure **must** be provided in the `next` chain of the XrCompositionLayerBaseHeader structure.

Valid Usage (Implicit)

- The `XR_FB_composition_layer_alpha_blend` extension **must** be enabled prior to using XrCompositionLayerAlphaBlendFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_ALPHA_BLEND_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `srcFactorColor` **must** be a valid XrBlendFactorFB value
- `dstFactorColor` **must** be a valid XrBlendFactorFB value
- `srcFactorAlpha` **must** be a valid XrBlendFactorFB value
- `dstFactorAlpha` **must** be a valid XrBlendFactorFB value

New Functions

Issues

- Should we add separate blend controls for color and alpha?
  - Yes. New use cases necessitated adding separate blend controls for color and alpha.

Version History

- Revision 1, 2020-06-22 (Gloria Kennickell)
  - Initial draft
- Revision 2, 2020-06-22 (Gloria Kennickell)
  - Provide separate controls for color and alpha blend factors.
- Revision 3, 2024-03-04 (Xiang Wei)
  - Clarify the superseding of layer blending operation.
  - Add warning about the exclusive usage with non-opaque environment blend modes.

Overview

This extension enables depth-tested layer composition. The compositor will maintain a depth buffer in

addition to a color buffer. The depth buffer is cleared to a depth corresponding to the infinitely far distance at the beginning of composition.

When composing each layer, if depth testing is requested, the incoming layer depths are transformed into the compositor window space depth and compared to the depth stored in the frame buffer. After the transformation, incoming depths that are outside of the range of the compositor window space depth **must** be clamped. If the depth test fails, the fragment is discarded. If the depth test passes the depth buffer is updated if depth writes are enabled, and color processing continues.

Depth testing requires depth values for the layer. For projection layers, this can be supplied via the XR_KHR_composition_layer_depth extension. For geometric primitive layers, the runtime computes the depth of the sample directly from the layer parameters. An XrCompositionLayerDepthTestFB chained to layers without depth **must** be ignored.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_DEPTH_TEST_FB

New Enums

The possible comparison operations are specified by the XrCompareOpFB enumeration.

```
// Provided by XR_FB_composition_layer_depth_test
typedef enum XrCompareOpFB {
    XR_COMPARE_OP_NEVER_FB = 0,
    XR_COMPARE_OP_LESS_FB = 1,
    XR_COMPARE_OP_EQUAL_FB = 2,
    XR_COMPARE_OP_LESS_OR_EQUAL_FB = 3,
    XR_COMPARE_OP_GREATER_FB = 4,
    XR_COMPARE_OP_NOT_EQUAL_FB = 5,
    XR_COMPARE_OP_GREATER_OR_EQUAL_FB = 6,
    XR_COMPARE_OP_ALWAYS_FB = 7,
    XR_COMPARE_OP_MAX_ENUM_FB = 0x7FFFFFFF
} XrCompareOpFB;
```

Enumerant Descriptions

- XR_COMPARE_OP_NEVER_FB — Comparison is never true.
- XR_COMPARE_OP_LESS_FB — Comparison is true if source less than is destination.
- XR_COMPARE_OP_EQUAL_FB — Comparison is true if source is equal to destination.
- XR_COMPARE_OP_LESS_OR_EQUAL_FB — Comparison is true if source is less than or equal to destination.
- XR_COMPARE_OP_GREATER_FB — Comparison is true if source is greater than destination.
- XR_COMPARE_OP_NOT_EQUAL_FB — Comparison is true if source is not equal to destination.
- XR_COMPARE_OP_GREATER_OR_EQUAL_FB — Comparison is true if source is greater than or equal to destination.
- XR_COMPARE_OP_ALWAYS_FB — Comparison is always true.

New Structures

The XrCompositionLayerDepthTestFB structure is defined as:

```
// Provided by XR_FB_composition_layer_depth_test
typedef struct XrCompositionLayerDepthTestFB {
    XrStructureType    type;
    const void*        next;
    XrBool32           depthMask;
    XrCompareOpFB      compareOp;
} XrCompositionLayerDepthTestFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- depthMask is a boolean indicating whether writes to the composition depth buffer are enabled.
- compareOp is an enum that indicates which compare operation is used in the depth test.

To specify that a layer should be depth tested, a XrCompositionLayerDepthTestFB structure **must** be passed via the polymorphic XrCompositionLayerBaseHeader structure's next parameter chain.

Valid Usage (Implicit)

- The `XR_FB_composition_layer_depth_test` extension **must** be enabled prior to using XrCompositionLayerDepthTestFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_DEPTH_TEST_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `compareOp` **must** be a valid XrCompareOpFB value

Gloria Kennickell, Facebook

Overview

This extension does not define a new composition layer type, but rather it defines parameters that change the interpretation of the image layout, where the default image layout is dictated by the Graphics API.

New Object Types

New Flag Types

```
// Provided by XR_FB_composition_layer_image_layout
typedef XrFlags64 XrCompositionLayerImageLayoutFlagsFB;
```

```
// Provided by XR_FB_composition_layer_image_layout
// Flag bits for XrCompositionLayerImageLayoutFlagsFB
static const XrCompositionLayerImageLayoutFlagsFB
XR_COMPOSITION_LAYER_IMAGE_LAYOUT_VERTICAL_FLIP_BIT_FB = 0x00000001;
```

Flag Descriptions

- XR_COMPOSITION_LAYER_IMAGE_LAYOUT_VERTICAL_FLIP_BIT_FB indicates the coordinate origin must be considered flipped vertically.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_IMAGE_LAYOUT_FB

New Enums

- XR_COMPOSITION_LAYER_IMAGE_LAYOUT_VERTICAL_FLIP_BIT_FB

New Structures

The XrCompositionLayerImageLayoutFB structure is defined as:

```
// Provided by XR_FB_composition_layer_image_layout
typedef struct XrCompositionLayerImageLayoutFB {
    XrStructureType                         type;
    void*                                   next;
    XrCompositionLayerImageLayoutFlagsFB    flags;
} XrCompositionLayerImageLayoutFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrCompositionLayerImageLayoutFlagBitsFB.

XrCompositionLayerImageLayoutFB contains additional flags used to change the interpretation of the image layout for a composition layer.

To specify the additional flags, you **must** create a XrCompositionLayerImageLayoutFB structure and pass it via the XrCompositionLayerBaseHeader structure's `next` parameter.

Valid Usage (Implicit)

- The `XR_FB_composition_layer_image_layout` extension **must** be enabled prior to using XrCompositionLayerImageLayoutFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_IMAGE_LAYOUT_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrCompositionLayerImageLayoutFlagBitsFB values

Overview

This extension does not define a new composition layer type, but rather it provides support for the application to specify an existing composition layer type has secure content and whether it must be completely excluded from external outputs, like video or screen capture, or if proxy content must be rendered in its place.

New Object Types

New Flag Types

```
// Provided by XR_FB_composition_layer_alpha_blend
typedef XrFlags64 XrCompositionLayerSecureContentFlagsFB;
```

```
// Provided by XR_FB_composition_layer_alpha_blend
// Flag bits for XrCompositionLayerSecureContentFlagsFB
static const XrCompositionLayerSecureContentFlagsFB
XR_COMPOSITION_LAYER_SECURE_CONTENT_EXCLUDE_LAYER_BIT_FB = 0x00000001;
static const XrCompositionLayerSecureContentFlagsFB
XR_COMPOSITION_LAYER_SECURE_CONTENT_REPLACE_LAYER_BIT_FB = 0x00000002;
```

Flag Descriptions

- XR_COMPOSITION_LAYER_SECURE_CONTENT_EXCLUDE_LAYER_BIT_FB — Indicates the layer will only be visible inside the HMD, and not visible to external sources
- XR_COMPOSITION_LAYER_SECURE_CONTENT_REPLACE_LAYER_BIT_FB — Indicates the layer will be displayed inside the HMD, but replaced by proxy content when written to external sources

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_SECURE_CONTENT_FB

New Enums

- XR_COMPOSITION_LAYER_SECURE_CONTENT_EXCLUDE_LAYER_BIT_FB
- XR_COMPOSITION_LAYER_SECURE_CONTENT_REPLACE_LAYER_BIT_FB

New Structures

The XrCompositionLayerSecureContentFB structure is defined as:

```
// Provided by XR_FB_composition_layer_secure_content
typedef struct XrCompositionLayerSecureContentFB {
    XrStructureType                           type;
    const void*                               next;
    XrCompositionLayerSecureContentFlagsFB    flags;
} XrCompositionLayerSecureContentFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- flags is a bitmask of XrCompositionLayerSecureContentFlagBitsFB.

XrCompositionLayerSecureContentFB contains additional flags to indicate a composition layer contains secure content and must not be written to external outputs.

If both XR_COMPOSITION_LAYER_SECURE_CONTENT_EXCLUDE_LAYER_BIT_FB and XR_COMPOSITION_LAYER_SECURE_CONTENT_REPLACE_LAYER_BIT_FB are set, XR_COMPOSITION_LAYER_SECURE_CONTENT_EXCLUDE_LAYER_BIT_FB will take precedence.

To specify the additional flags, you **must** create a XrCompositionLayerSecureContentFB structure and pass it via the XrCompositionLayerBaseHeader structure's next parameter.

Valid Usage (Implicit)

- The `XR_FB_composition_layer_secure_content` extension **must** be enabled prior to using XrCompositionLayerSecureContentFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_SECURE_CONTENT_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be a valid combination of XrCompositionLayerSecureContentFlagBitsFB values
- `flags` **must** not be `0`

Overview

This extension allows applications to request the use of processing options such as sharpening or super-sampling on a composition layer.

New Object Types

New Flag Types

```
// Provided by XR_FB_composition_layer_settings
typedef XrFlags64 XrCompositionLayerSettingsFlagsFB;
```

```
// Provided by XR_FB_composition_layer_settings
// Flag bits for XrCompositionLayerSettingsFlagsFB
static const XrCompositionLayerSettingsFlagsFB
XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SUPER_SAMPLING_BIT_FB = 0x00000001;
static const XrCompositionLayerSettingsFlagsFB
XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SUPER_SAMPLING_BIT_FB = 0x00000002;
static const XrCompositionLayerSettingsFlagsFB
XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SHARPENING_BIT_FB = 0x00000004;
static const XrCompositionLayerSettingsFlagsFB
XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SHARPENING_BIT_FB = 0x00000008;
  // Provided by XR_META_automatic_layer_filter
static const XrCompositionLayerSettingsFlagsFB
XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META = 0x00000020;
```

Flag Descriptions

- XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SUPER_SAMPLING_BIT_FB — Indicates compositor **may** use layer texture supersampling.
- XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SUPER_SAMPLING_BIT_FB — Indicates compositor **may** use high quality layer texture supersampling.
- XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SHARPENING_BIT_FB — Indicates compositor **may** use layer texture sharpening.
- XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SHARPENING_BIT_FB — Indicates compositor **may** use high quality layer texture sharpening.
- XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META — Indicates compositor **may** automatically toggle a texture filtering mechanism to improve visual quality of layer. This **must** not be the only bit set. (Added by XR_META_automatic_layer_filter) (Added by the XR_META_automatic_layer_filter extension)

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_SETTINGS_FB

New Enums

- XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SUPER_SAMPLING_BIT_FB
- XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SUPER_SAMPLING_BIT_FB
- XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SHARPENING_BIT_FB
- XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SHARPENING_BIT_FB

New Structures

The XrCompositionLayerSettingsFB structure is defined as:

```
// Provided by XR_FB_composition_layer_settings
typedef struct XrCompositionLayerSettingsFB {
    XrStructureType                       type;
    const void*                           next;
    XrCompositionLayerSettingsFlagsFB     layerFlags;
} XrCompositionLayerSettingsFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- layerFlags is a bitmask of XrCompositionLayerSettingsFlagBitsFB.

XrCompositionLayerSettingsFB contains additional flags to indicate which processing steps to perform on a composition layer.

If both XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SUPER_SAMPLING_BIT_FB and XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SUPER_SAMPLING_BIT_FB are set, XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SUPER_SAMPLING_BIT_FB will take precedence.

If both XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SHARPENING_BIT_FB and XR_COMPOSITION_LAYER_SETTINGS_QUALITY_SHARPENING_BIT_FB are set, XR_COMPOSITION_LAYER_SETTINGS_NORMAL_SHARPENING_BIT_FB will take precedence.

To specify the additional flags, create an XrCompositionLayerSettingsFB structure and pass it via the XrCompositionLayerBaseHeader structure's next parameter.

Valid Usage (Implicit)

- The `XR_FB_composition_layer_settings` extension **must** be enabled prior to using XrCompositionLayerSettingsFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_SETTINGS_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `layerFlags` **must** be a valid combination of XrCompositionLayerSettingsFlagBitsFB values
- `layerFlags` **must** not be `0`

Overview

On platforms which support dynamically adjusting the display refresh rate, application developers may request a specific display refresh rate in order to improve the overall user experience, examples include:

- A video application may choose a display refresh rate which better matches the video content playback rate in order to achieve smoother video frames.
- An application which can support a higher frame rate may choose to render at the higher rate to improve the overall perceptual quality, for example, lower latency and less flicker.

This extension allows:

- An application to identify what display refresh rates the session supports and the current display refresh rate.
- An application to request a display refresh rate to indicate its preference to the runtime.
- An application to receive notification of changes to the display refresh rate which are delivered via events.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_EVENT_DATA_DISPLAY_REFRESH_RATE_CHANGED_FB`

XrResult enumeration is extended with:

- `XR_ERROR_DISPLAY_REFRESH_RATE_UNSUPPORTED_FB`

New Enums

New Structures

Receiving the XrEventDataDisplayRefreshRateChangedFB event structure indicates that the display refresh rate has changed.

The XrEventDataDisplayRefreshRateChangedFB structure is defined as:

```
// Provided by XR_FB_display_refresh_rate
typedef struct XrEventDataDisplayRefreshRateChangedFB {
    XrStructureType    type;
    const void*        next;
    float              fromDisplayRefreshRate;
    float              toDisplayRefreshRate;
} XrEventDataDisplayRefreshRateChangedFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `fromDisplayRefreshRate` is the previous display refresh rate.
- `toDisplayRefreshRate` is the new display refresh rate.

Valid Usage (Implicit)

- The `XR_FB_display_refresh_rate` extension **must** be enabled prior to using XrEventDataDisplayRefreshRateChangedFB
- `type` **must** be `XR_TYPE_EVENT_DATA_DISPLAY_REFRESH_RATE_CHANGED_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrEnumerateDisplayRefreshRatesFB function is defined as:

```
// Provided by XR_FB_display_refresh_rate
XrResult xrEnumerateDisplayRefreshRatesFB(
    XrSession                                   session,
    uint32_t                                    displayRefreshRateCapacityInput,
    uint32_t*                                   displayRefreshRateCountOutput,
    float*                                      displayRefreshRates);
```

Parameter Descriptions

- `session` is the session that enumerates the supported display refresh rates.
- `displayRefreshRateCapacityInput` is the capacity of the `displayRefreshRates`, or 0 to retrieve the required capacity.
- `displayRefreshRateCountOutput` is a pointer to the count of `float displayRefreshRates` written, or a pointer to the required capacity in the case that `displayRefreshRateCapacityInput` is insufficient.
- `displayRefreshRates` is a pointer to an array of `float` display refresh rates, but **can** be `NULL` if `displayRefreshRateCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `displayRefreshRates` size.

xrEnumerateDisplayRefreshRatesFB enumerates the display refresh rates supported by the current session. Display refresh rates **must** be in order from lowest to highest supported display refresh rates. Runtimes **must** always return identical buffer contents from this enumeration for the lifetime of the session.

Valid Usage (Implicit)

- The `XR_FB_display_refresh_rate` extension **must** be enabled prior to calling xrEnumerateDisplayRefreshRatesFB
- `session` **must** be a valid XrSession handle
- `displayRefreshRateCountOutput` **must** be a pointer to a `uint32_t` value
- If `displayRefreshRateCapacityInput` is not `0`, `displayRefreshRates` **must** be a pointer to an array of `displayRefreshRateCapacityInput` `float` values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrGetDisplayRefreshRateFB function is defined as:

```
// Provided by XR_FB_display_refresh_rate
XrResult xrGetDisplayRefreshRateFB(
    XrSession                                   session,
    float*                                      displayRefreshRate);
```

Parameter Descriptions

- session is the XrSession to query.
- displayRefreshRate is a pointer to a float into which the current display refresh rate will be placed.

xrGetDisplayRefreshRateFB retrieves the current display refresh rate.

Valid Usage (Implicit)

- The XR_FB_display_refresh_rate extension **must** be enabled prior to calling xrGetDisplayRefreshRateFB
- session **must** be a valid XrSession handle
- displayRefreshRate **must** be a pointer to a float value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrRequestDisplayRefreshRateFB function is defined as:

```
// Provided by XR_FB_display_refresh_rate
XrResult xrRequestDisplayRefreshRateFB(
    XrSession                                   session,
    float                                       displayRefreshRate);
```

Parameter Descriptions

- session is a valid XrSession handle.
- displayRefreshRate is 0.0f or a supported display refresh rate. Supported display refresh rates are indicated by xrEnumerateDisplayRefreshRatesFB.

xrRequestDisplayRefreshRateFB provides a mechanism for an application to request the system to dynamically change the display refresh rate to the application preferred value. The runtime **must** return XR_ERROR_DISPLAY_REFRESH_RATE_UNSUPPORTED_FB if displayRefreshRate is not either 0.0f or one of the values enumerated by xrEnumerateDisplayRefreshRatesFB. A display refresh rate of 0.0f indicates the application has no preference.

Note that this is only a request and does not guarantee the system will switch to the requested display refresh rate.

Valid Usage (Implicit)

- The `XR_FB_display_refresh_rate` extension **must** be enabled prior to calling xrRequestDisplayRefreshRateFB
- `session` **must** be a valid XrSession handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_DISPLAY_REFRESH_RATE_UNSUPPORTED_FB`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

Changing the display refresh rate from its system default does not come without trade-offs. Increasing the display refresh rate puts more load on the entire system and can lead to thermal degradation. Conversely, lowering the display refresh rate can provide better thermal sustainability but at the cost of more perceptual issues, like higher latency and flickering.

12.104.1. Overview

This extension enables applications to obtain position and orientation of the user's eyes. It enables applications to render eyes in XR experiences.

This extension is intended to drive animation of avatar eyes. So, for that purpose, the runtimes **may** filter the poses in ways that are suitable for avatar eye interaction but detrimental to other use cases. This extension **should** not be used for other eye tracking purposes. For interaction, `XR_EXT_eye_gaze_interaction` **should** be used.

Eye tracking data is sensitive personal information and is closely linked to personal privacy and integrity. It is strongly recommended that applications that store or transfer eye tracking data always ask the user for active and specific acceptance to do so.

If a runtime supports a permission system to control application access to the eye tracker, then the runtime **must** set the `isValid` field to `XR_FALSE` on the supplied XrEyeGazeFB structure until the application has been allowed access to the eye tracker. When the application access has been allowed, the runtime **may** set `isValid` on the supplied XrEyeGazeFB structure to `XR_TRUE`.

12.104.2. Inspect system capability

The XrSystemEyeTrackingPropertiesFB structure is defined as:

```
// Provided by XR_FB_eye_tracking_social
typedef struct XrSystemEyeTrackingPropertiesFB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsEyeTracking;
} XrSystemEyeTrackingPropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsEyeTracking` is an `XrBool32`, indicating if the current system is capable of receiving eye tracking input.

An application **can** inspect whether the system is capable of eye tracking input by extending the XrSystemProperties with XrSystemEyeTrackingPropertiesFB structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsEyeTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateEyeTrackerFB.

Valid Usage (Implicit)

- The `XR_FB_eye_tracking_social` extension **must** be enabled prior to using XrSystemEyeTrackingPropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_EYE_TRACKING_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.104.3. Create an eye tracker handle

The XrEyeTrackerFB handle represents the resources for eye tracking.

```
// Provided by XR_FB_eye_tracking_social
XR_DEFINE_HANDLE(XrEyeTrackerFB)
```

This handle is used for getting eye gaze using xrGetEyeGazesFB function.

An eye tracker provides eye gaze directions.

An application creates an XrEyeTrackerFB handle using xrCreateEyeTrackerFB function.

```
// Provided by XR_FB_eye_tracking_social
XrResult xrCreateEyeTrackerFB(
    XrSession                                   session,
    const XrEyeTrackerCreateInfoFB*             createInfo,
    XrEyeTrackerFB*                             eyeTracker);
```

Parameter Descriptions

- session is an XrSession in which the eye tracker will be active.
- createInfo is the XrEyeTrackerCreateInfoFB used to specify the eye tracker.
- eyeTracker is the returned XrEyeTrackerFB handle.

If the system does not support eye tracking, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrCreateEyeTrackerFB. In this case, the runtime **must** return XR_FALSE for XrSystemEyeTrackingPropertiesFB::supportsEyeTracking when the function xrGetSystemProperties is called, so that the application **can** avoid creating an eye tracker.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to calling xrCreateEyeTrackerFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrEyeTrackerCreateInfoFB structure
- eyeTracker **must** be a pointer to an XrEyeTrackerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrEyeTrackerCreateInfoFB structure is defined as:

```
// Provided by XR_FB_eye_tracking_social
typedef struct XrEyeTrackerCreateInfoFB {
    XrStructureType    type;
    const void*        next;
} XrEyeTrackerCreateInfoFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrEyeTrackerCreateInfoFB structure describes the information to create an XrEyeTrackerFB handle.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to using XrEyeTrackerCreateInfoFB
- `type` **must** be `XR_TYPE_EYE_TRACKER_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.104.4. Destroy an eye tracker handle

xrDestroyEyeTrackerFB function releases the `eyeTracker` and the underlying resources when the eye tracking experience is over.

```
// Provided by XR_FB_eye_tracking_social
XrResult xrDestroyEyeTrackerFB(
    XrEyeTrackerFB                              eyeTracker);
```

Parameter Descriptions

- `eyeTracker` is an XrEyeTrackerFB previously created by xrCreateEyeTrackerFB.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to calling xrDestroyEyeTrackerFB
- `eyeTracker` **must** be a valid XrEyeTrackerFB handle

Thread Safety

- Access to `eyeTracker`, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.104.5. Get eye gaze

The xrGetEyeGazesFB function is defined as:

```
// Provided by XR_FB_eye_tracking_social
XrResult xrGetEyeGazesFB(
    XrEyeTrackerFB                              eyeTracker,
    const XrEyeGazesInfoFB*                     gazeInfo,
    XrEyeGazesFB*                               eyeGazes);
```

Parameter Descriptions

- eyeTracker is an XrEyeTrackerFB previously created by xrCreateEyeTrackerFB.
- gazeInfo is the information to get eye gaze.
- eyeGazes is a pointer to XrEyeGazesFB receiving the returned eye poses and confidence.

The xrGetEyeGazesFB function obtains pose for a user's eyes at a specific time and within a specific coordinate system.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to calling xrGetEyeGazesFB
- eyeTracker **must** be a valid XrEyeTrackerFB handle
- gazeInfo **must** be a pointer to a valid XrEyeGazesInfoFB structure
- eyeGazes **must** be a pointer to an XrEyeGazesFB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrEyeGazesInfoFB structure describes the information to get eye gaze directions.

```
// Provided by XR_FB_eye_tracking_social
typedef struct XrEyeGazesInfoFB {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
} XrEyeGazesInfoFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- baseSpace is an XrSpace within which the returned eye poses will be represented.
- time is an XrTime at which the eye gaze information is requested.

The application **should** request a time equal to the predicted display time for the rendered frame. The system will employ appropriate modeling to provide eye gaze at this time.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to using XrEyeGazesInfoFB
- type **must** be XR_TYPE_EYE_GAZES_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- baseSpace **must** be a valid XrSpace handle

XrEyeGazesFB structure returns the state of the eye gaze directions.

```
// Provided by XR_FB_eye_tracking_social
typedef struct XrEyeGazesFB {
    XrStructureType    type;
    void*              next;
    XrEyeGazeFB        gaze[XR_EYE_POSITION_COUNT_FB];
    XrTime             time;
} XrEyeGazesFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- gaze is an array of XrEyeGazeFB receiving the returned eye gaze directions.
- time is an XrTime time at which the returned eye gaze is tracked or extrapolated to. Equals the time for which the eye gaze was requested if the interpolation at the time was successful.

Valid Usage (Implicit)

- The XR_FB_eye_tracking_social extension **must** be enabled prior to using XrEyeGazesFB
- type **must** be XR_TYPE_EYE_GAZES_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- Any given element of gaze **must** be a valid XrEyeGazeFB structure

XrEyeGazeFB structure describes the validity, direction, and confidence of a social eye gaze observation.

```
// Provided by XR_FB_eye_tracking_social
typedef struct XrEyeGazeFB {
    XrBool32    isValid;
    XrPosef     gazePose;
    float       gazeConfidence;
} XrEyeGazeFB;
```

Member Descriptions

- `isValid` is an `XrBool32` indicating if the returned gazePose is valid. Callers **should** check the validity of pose prior to use.
- `gazePose` is an `XrPosef` describing the position and orientation of the user's eye. The pose is represented in the coordinate system provided by `XrEyeGazesInfoFB`::`baseSpace`.
- `gazeConfidence` is a `float` value between 0 and 1 that represents the confidence for eye pose. A value of 0 represents no confidence in the pose returned, and a value of 1 means maximum confidence in the returned eye pose.

If the returned `isValid` is true, the runtime **must** return `gazePose` and `gazeConfidence`.

If the returned `isValid` is false, it indicates either the eye tracker did not detect the eye gaze or the application lost input focus.

The eye gaze pose is natively oriented with +Y up, +X to the right, and -Z forward and not gravity-aligned, similar to the `XR_REFERENCE_SPACE_TYPE_VIEW`.

Valid Usage (Implicit)

- The `XR_FB_eye_tracking_social` extension **must** be enabled prior to using `XrEyeGazeFB`

The `XrEyePositionFB` describes which eye in the specific position of the `gaze` is in the `XrEyeGazesFB`.

```
// Provided by XR_FB_eye_tracking_social
typedef enum XrEyePositionFB {
    XR_EYE_POSITION_LEFT_FB = 0,
    XR_EYE_POSITION_RIGHT_FB = 1,
    XR_EYE_POSITION_COUNT_FB = 2,
    XR_EYE_POSITION_MAX_ENUM_FB = 0x7FFFFFFF
} XrEyePositionFB;
```

Enumerant Descriptions

- `XR_EYE_POSITION_LEFT_FB` — Specifies the position of the left eye.
- `XR_EYE_POSITION_RIGHT_FB` — Specifies the position of the right eye.
- `XR_EYE_POSITION_COUNT_FB` — Specifies the number of eyes tracked.

12.104.6. Example code for locating eye gaze

The following example code demonstrates how to locate eye gaze relative to a world space.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized
XrSpace worldSpace;  // previously initialized, e.g. from
                     // XR_REFERENCE_SPACE_TYPE_LOCAL

XrSystemEyeTrackingPropertiesFB eyeTrackingSystemProperties{
    .type = XR_TYPE_SYSTEM_EYE_TRACKING_PROPERTIES_FB,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &eyeTrackingSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!eyeTrackingSystemProperties.supportsEyeTracking) {
    // The system does not support eye tracking.
    return;
}

// Get function pointer for xrCreateEyeTrackerFB.
PFN_xrCreateEyeTrackerFB pfnCreateEyeTrackerFB = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateEyeTrackerFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateEyeTrackerFB)));

// Create an eye tracker.
XrEyeTrackerFB eyeTracker{XR_NULL_HANDLE};
{
    XrEyeTrackerCreateInfoFB createInfo{
        .type = XR_TYPE_EYE_TRACKER_CREATE_INFO_FB,
    };
    CHK_XR(pfnCreateEyeTrackerFB(session, &createInfo, &eyeTracker));
}
```

```
// Allocate buffers to receive eyes pose and confidence data before frame
// the loop starts.
XrEyeGazesFB eyeGazes{
    .type = XR_TYPE_EYE_GAZES_FB,
    .next = nullptr,
};

// Get function pointer for xrGetEyeGazesFB.
PFN_xrGetEyeGazesFB pfnGetEyeGazesFB = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrGetEyeGazesFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnGetEyeGazesFB)));
while (1) {
    // ...
    // For every frame in frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrEyeGazesInfoFB gazesInfo{
        .type = XR_TYPE_EYE_GAZES_INFO_FB,
        .next = nullptr,
        .baseSpace = worldSpace,
        .time = time,
    };

    CHK_XR(pfnGetEyeGazesFB(eyeTracker, &gazesInfo, &eyeGazes));

    if (eyeGazes.gaze[XR_EYE_POSITION_LEFT_FB].isValid) {
        // ....
    }
}
```

New Object Types

- XrEyeTrackerFB

New Flag Types

New Enum Constants

XrObjectType enumeration is extended with:

- XR_OBJECT_TYPE_EYE_TRACKER_FB

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_EYE_TRACKING_PROPERTIES_FB

- `XR_TYPE_EYE_TRACKER_CREATE_INFO_FB`
- `XR_TYPE_EYE_GAZES_INFO_FB`
- `XR_TYPE_EYE_GAZES_FB`

New Enums

- XrEyePositionFB

New Structures

- XrSystemEyeTrackingPropertiesFB
- XrEyeTrackerCreateInfoFB
- XrEyeGazesInfoFB
- XrEyeGazeFB
- XrEyeGazesFB

New Functions

- xrCreateEyeTrackerFB
- xrDestroyEyeTrackerFB
- xrGetEyeGazesFB

12.105.1. Overview

This extension enables applications to get weights of blend shapes. It also enables applications to render facial expressions in XR experiences.

Face tracking data is sensitive personal information and is closely linked to personal privacy and integrity. It is strongly recommended that applications storing or transferring face tracking data always ask the user for active and specific acceptance to do so.

If a runtime supports a permission system to control application access to the face tracker, then the runtime **must** set the `isValid` field to `XR_FALSE` on the supplied XrFaceExpressionStatusFB structure until the user allows the application to access the face tracker. When the application access has been allowed, the runtime **may** set `isValid` on the supplied XrFaceExpressionStatusFB structure to `XR_TRUE`.

Some permission systems **may** control access to the eye tracking separately from access to the face tracking, even though the eyes are part of the face. In case the user denied tracking of the eyes, yet, allowed tracking of the face, then the runtime **must** set the `isEyeFollowingBlendshapesValid` field to `XR_FALSE` on the supplied XrFaceExpressionStatusFB for indicating that eye tracking data is not available, but at the same time **may** set the `isValid` field to `XR_TRUE` on the supplied XrFaceExpressionStatusFB for indicating that another part of the face is tracked properly.

12.105.2. Inspect system capability

```
// Provided by XR_FB_face_tracking
typedef struct XrSystemFaceTrackingPropertiesFB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsFaceTracking;
} XrSystemFaceTrackingPropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsFaceTracking` is an `XrBool32`, indicating if current system is capable of receiving face tracking input.

An application **can** inspect whether the system is capable of receiving face tracking input by extending the XrSystemProperties with XrSystemFaceTrackingPropertiesFB structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsFaceTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFaceTrackerFB.

Valid Usage (Implicit)

- The `XR_FB_face_tracking` extension **must** be enabled prior to using XrSystemFaceTrackingPropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.105.3. Create a face tracker handle

The XrFaceTrackerFB handle represents the resources for face tracking.

```
// Provided by XR_FB_face_tracking
XR_DEFINE_HANDLE(XrFaceTrackerFB)
```

This handle is used to obtain blend shapes using the xrGetFaceExpressionWeightsFB function.

The xrCreateFaceTrackerFB function is defined as:

```
// Provided by XR_FB_face_tracking
XrResult xrCreateFaceTrackerFB(
    XrSession                                   session,
    const XrFaceTrackerCreateInfoFB*            createInfo,
    XrFaceTrackerFB*                            faceTracker);
```

Parameter Descriptions

- `session` is an XrSession in which the face tracker will be active.
- `createInfo` is the XrFaceTrackerCreateInfoFB used to specify the face tracker.
- `faceTracker` is the returned XrFaceTrackerFB handle.

An application **can** create an XrFaceTrackerFB handle using xrCreateFaceTrackerFB function.

If the system does not support face tracking, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFaceTrackerFB. In this case, the runtime **must** return `XR_FALSE` for XrSystemFaceTrackingPropertiesFB::`supportsFaceTracking` when the function xrGetSystemProperties is called, so that the application **can** avoid creating a face tracker.

Valid Usage (Implicit)

- The `XR_FB_face_tracking` extension **must** be enabled prior to calling xrCreateFaceTrackerFB
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrFaceTrackerCreateInfoFB structure
- `faceTracker` **must** be a pointer to an XrFaceTrackerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrFaceTrackerCreateInfoFB structure is described as follows:

```
// Provided by XR_FB_face_tracking
typedef struct XrFaceTrackerCreateInfoFB {
    XrStructureType          type;
    const void*              next;
    XrFaceExpressionSetFB    faceExpressionSet;
} XrFaceTrackerCreateInfoFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- faceExpressionSet is an XrFaceExpressionSetFB that describe the set of blend shapes to retrieve.

The XrFaceTrackerCreateInfoFB structure describes the information to create an XrFaceTrackerFB handle.

Valid Usage (Implicit)

- The XR_FB_face_tracking extension **must** be enabled prior to using XrFaceTrackerCreateInfoFB
- type **must** be XR_TYPE_FACE_TRACKER_CREATE_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- faceExpressionSet **must** be a valid XrFaceExpressionSetFB value

The XrFaceExpressionSetFB enum describes the set of blend shapes of a facial expression to track when creating an XrFaceTrackerFB.

```
// Provided by XR_FB_face_tracking
typedef enum XrFaceExpressionSetFB {
    XR_FACE_EXPRESSION_SET_DEFAULT_FB = 0,
    XR_FACE_EXPRESSION_SET_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceExpressionSetFB;
```

Enumerant Descriptions

- XR_FACE_EXPRESSION_SET_DEFAULT_FB — indicates that the created XrFaceTrackerFB tracks the set of blend shapes described by XrFaceExpressionFB enum, i.e. the xrGetFaceExpressionWeightsFB function returns an array of blend shapes with the count of XR_FACE_EXPRESSION_COUNT_FB and **can** be indexed using XrFaceExpressionFB.

```
// Provided by XR_FB_face_tracking
#define XR_FACE_EXPRESSSION_SET_DEFAULT_FB XR_FACE_EXPRESSION_SET_DEFAULT_FB
```

The XR_FACE_EXPRESSSION_SET_DEFAULT_FB is an alias for XR_FACE_EXPRESSION_SET_DEFAULT_FB for backward compatibility, deprecated and **should** not be used.

12.105.4. Delete a face tracker handle

The xrDestroyFaceTrackerFB function releases the faceTracker and the underlying resources when face tracking experience is over.

```
// Provided by XR_FB_face_tracking
XrResult xrDestroyFaceTrackerFB(
    XrFaceTrackerFB                             faceTracker);
```

Parameter Descriptions

- `faceTracker` is an XrFaceTrackerFB previously created by xrCreateFaceTrackerFB.

Valid Usage (Implicit)

- The `XR_FB_face_tracking` extension **must** be enabled prior to calling xrDestroyFaceTrackerFB
- `faceTracker` **must** be a valid XrFaceTrackerFB handle

Thread Safety

- Access to `faceTracker`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

12.105.5. Obtain facial expressions

The xrGetFaceExpressionWeightsFB function return blend shapes of facial expression at a given time.

```
// Provided by XR_FB_face_tracking
XrResult xrGetFaceExpressionWeightsFB(
    XrFaceTrackerFB                             faceTracker,
    const XrFaceExpressionInfoFB*               expressionInfo,
    XrFaceExpressionWeightsFB*                  expressionWeights);
```

Parameter Descriptions

- `faceTracker` is an XrFaceTrackerFB previously created by xrCreateFaceTrackerFB.
- `expressionInfo` is a pointer to XrFaceExpressionInfoFB describing information to obtain face expression.
- `expressionWeights` is a pointer to XrFaceExpressionWeightsFB receiving the returned facial expression weights.

Valid Usage (Implicit)

- The `XR_FB_face_tracking` extension **must** be enabled prior to calling xrGetFaceExpressionWeightsFB
- `faceTracker` **must** be a valid XrFaceTrackerFB handle
- `expressionInfo` **must** be a pointer to a valid XrFaceExpressionInfoFB structure
- `expressionWeights` **must** be a pointer to an XrFaceExpressionWeightsFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

The XrFaceExpressionInfoFB structure describes the information to obtain facial expression.

```
// Provided by XR_FB_face_tracking
typedef struct XrFaceExpressionInfoFB {
    XrStructureType    type;
    const void*        next;
    XrTime             time;
} XrFaceExpressionInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `time` is an `XrTime` at which the facial expression weights are requested.

Callers **should** request a time equal to the predicted display time for the rendered frame. The system will employ appropriate modeling to provide expressions for this time.

Valid Usage (Implicit)

- The `XR_FB_face_tracking` extension **must** be enabled prior to using XrFaceExpressionInfoFB
- `type` **must** be `XR_TYPE_FACE_EXPRESSION_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

XrFaceExpressionWeightsFB structure returns the facial expression.

```
// Provided by XR_FB_face_tracking
typedef struct XrFaceExpressionWeightsFB {
    XrStructureType             type;
    void*                       next;
    uint32_t                    weightCount;
    float*                      weights;
    uint32_t                    confidenceCount;
    float*                      confidences;
    XrFaceExpressionStatusFB    status;
    XrTime                      time;
} XrFaceExpressionWeightsFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `weightCount` is a `uint32_t` describing the count of elements in `weights` array.
- `weights` is a pointer to an application-allocated array of `float` that will be filled with weights of facial expression blend shapes.
- `confidenceCount` is a `uint32_t` describing the count of elements in `confidences` array.
- `confidences` is a pointer to an application-allocated array of `float` that will be filled with confidence of tracking specific parts of a face.
- `status` is the XrFaceExpressionStatusFB of validity status of the expression weights.
- `time` is an `XrTime` time at which the returned expression weights are tracked or extrapolated to. Equals the time at which the expression weights were requested if the extrapolating at the time was successful.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `weightCount` is not equal to the number of blend shapes defined by the XrFaceExpressionSetFB used to create the XrFaceTrackerFB.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `confidenceCount` is not equal to the number of confidence areas defined by the XrFaceExpressionSetFB used to create the XrFaceTrackerFB.

The runtime **must** return `weights` representing the weights of blend shapes of current facial expression.

The runtime **must** update the `weights` array ordered so that the application **can** index elements using the corresponding facial expression enum (e.g. XrFaceExpressionFB) as described by XrFaceExpressionSetFB when creating the XrFaceTrackerFB. For example, when the XrFaceTrackerFB is created with `XR_FACE_EXPRESSION_SET_DEFAULT_FB`, the application sets the `weightCount` to `XR_FACE_EXPRESSION_COUNT_FB`, and the runtime **must** fill the `weights` array ordered so that it **can** be indexed by the XrFaceExpressionFB enum.

The runtime **must** update the `confidences` array ordered so that the application **can** index elements using the corresponding confidence area enum (e.g. XrFaceConfidenceFB) as described by XrFaceExpressionSetFB when creating the XrFaceTrackerFB. For example, when the XrFaceTrackerFB is created with `XR_FACE_EXPRESSION_SET_DEFAULT_FB`, the application sets the `confidenceCount` to `XR_FACE_CONFIDENCE_COUNT_FB`, and the runtime **must** fill the `confidences` array ordered so that it **can** be indexed by the XrFaceConfidenceFB enum.

Valid Usage (Implicit)

- The XR_FB_face_tracking extension **must** be enabled prior to using XrFaceExpressionWeightsFB
- type **must** be XR_TYPE_FACE_EXPRESSION_WEIGHTS_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- weights **must** be a pointer to an array of weightCount float values
- confidences **must** be a pointer to an array of confidenceCount float values
- status **must** be a valid XrFaceExpressionStatusFB structure
- The weightCount parameter **must** be greater than 0
- The confidenceCount parameter **must** be greater than 0

XrFaceExpressionStatusFB structure describes the validity of facial expression weights.

```
// Provided by XR_FB_face_tracking
typedef struct XrFaceExpressionStatusFB {
    XrBool32    isValid;
    XrBool32    isEyeFollowingBlendshapesValid;
} XrFaceExpressionStatusFB;
```

Member Descriptions

- isValid is an XrBool32 which indicates that the tracked expression weights are valid.
- isEyeFollowingBlendshapesValid is an XrBool32 which indicates if the 8 expression weights with prefix XR_FACE_EXPRESSION_EYES_LOOK_* are valid.

If the returned isValid is XR_FALSE, then it indicates that the face tracker failed to track or lost track of the face, or the application lost focus, or the consent for face tracking was denied.

If the returned isValid is XR_TRUE, the runtime **must** return all weights (or all weights except eyes related weights, see isEyeFollowingBlendshapesValid).

If the returned isEyeFollowingBlendshapesValid is XR_FALSE, then it indicates that the eye tracking driving blendshapes with prefix XR_FACE_EXPRESSION_EYES_LOOK_* lost track or the consent for eye tracking was denied.

Valid Usage (Implicit)

- The XR_FB_face_tracking extension **must** be enabled prior to using XrFaceExpressionStatusFB

12.105.6. Example code for obtaining facial expression

The following example code demonstrates how to obtain all weights for facial expression blend shapes.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// Confirm face tracking system support.
XrSystemFaceTrackingPropertiesFB faceTrackingSystemProperties{
    .type = XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES_FB,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &faceTrackingSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!faceTrackingSystemProperties.supportsFaceTracking) {
    // The system does not support face tracking
    return;
}

// Get function pointer for xrCreateFaceTrackerFB.
PFN_xrCreateFaceTrackerFB pfnCreateFaceTrackerFB = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateFaceTrackerFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateFaceTrackerFB)));

// Create a face tracker for default set of facial expressions.
XrFaceTrackerFB faceTracker{XR_NULL_HANDLE};
{
    XrFaceTrackerCreateInfoFB createInfo{
        .type = XR_TYPE_FACE_TRACKER_CREATE_INFO_FB,
        .next = nullptr,
        .faceExpressionSet = XR_FACE_EXPRESSION_SET_DEFAULT_FB,
    };
    CHK_XR(pfnCreateFaceTrackerFB(session, &createInfo, &faceTracker));
}

// Allocate buffers to receive facial expression data before frame
// loop starts.
```

```
float weights[XR_FACE_EXPRESSION_COUNT_FB];
float confidences[XR_FACE_CONFIDENCE_COUNT_FB];

XrFaceExpressionWeightsFB expressionWeights{
    .type = XR_TYPE_FACE_EXPRESSION_WEIGHTS_FB,
    .next = nullptr,
    .weightCount = XR_FACE_EXPRESSION_COUNT_FB,
    .weights = weights,
    .confidenceCount = XR_FACE_CONFIDENCE_COUNT_FB,
    .confidences = confidences,
};

// Get function pointer for xrGetFaceExpressionWeightsFB.
PFN_xrGetFaceExpressionWeightsFB pfnGetFaceExpressionWeights = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrGetFaceExpressionWeightsFB",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnGetFaceExpressionWeights)));
while (1) {
    // ...
    // For every frame in the frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrFaceExpressionInfoFB expressionInfo{
        .type = XR_TYPE_FACE_EXPRESSION_INFO_FB,
        .next = nullptr,
        .time = time,
    };

    CHK_XR(pfnGetFaceExpressionWeights(faceTracker, &expressionInfo, &
expressionWeights));

    if (expressionWeights.status.isValid) {
        for (uint32_t i = 0; i < XR_FACE_EXPRESSION_COUNT_FB; ++i) {
            // weights[i] contains a weight of specific blend shape
        }
    }
}
```

12.105.7. Conventions of blend shapes

This extension defines 63 blend shapes for tracking facial expressions.

```
// Provided by XR_FB_face_tracking
typedef enum XrFaceExpressionFB {
```

```
    XR_FACE_EXPRESSION_BROW_LOWERER_L_FB = 0,
    XR_FACE_EXPRESSION_BROW_LOWERER_R_FB = 1,
    XR_FACE_EXPRESSION_CHEEK_PUFF_L_FB = 2,
    XR_FACE_EXPRESSION_CHEEK_PUFF_R_FB = 3,
    XR_FACE_EXPRESSION_CHEEK_RAISER_L_FB = 4,
    XR_FACE_EXPRESSION_CHEEK_RAISER_R_FB = 5,
    XR_FACE_EXPRESSION_CHEEK_SUCK_L_FB = 6,
    XR_FACE_EXPRESSION_CHEEK_SUCK_R_FB = 7,
    XR_FACE_EXPRESSION_CHIN_RAISER_B_FB = 8,
    XR_FACE_EXPRESSION_CHIN_RAISER_T_FB = 9,
    XR_FACE_EXPRESSION_DIMPLER_L_FB = 10,
    XR_FACE_EXPRESSION_DIMPLER_R_FB = 11,
    XR_FACE_EXPRESSION_EYES_CLOSED_L_FB = 12,
    XR_FACE_EXPRESSION_EYES_CLOSED_R_FB = 13,
    XR_FACE_EXPRESSION_EYES_LOOK_DOWN_L_FB = 14,
    XR_FACE_EXPRESSION_EYES_LOOK_DOWN_R_FB = 15,
    XR_FACE_EXPRESSION_EYES_LOOK_LEFT_L_FB = 16,
    XR_FACE_EXPRESSION_EYES_LOOK_LEFT_R_FB = 17,
    XR_FACE_EXPRESSION_EYES_LOOK_RIGHT_L_FB = 18,
    XR_FACE_EXPRESSION_EYES_LOOK_RIGHT_R_FB = 19,
    XR_FACE_EXPRESSION_EYES_LOOK_UP_L_FB = 20,
    XR_FACE_EXPRESSION_EYES_LOOK_UP_R_FB = 21,
    XR_FACE_EXPRESSION_INNER_BROW_RAISER_L_FB = 22,
    XR_FACE_EXPRESSION_INNER_BROW_RAISER_R_FB = 23,
    XR_FACE_EXPRESSION_JAW_DROP_FB = 24,
    XR_FACE_EXPRESSION_JAW_SIDEWAYS_LEFT_FB = 25,
    XR_FACE_EXPRESSION_JAW_SIDEWAYS_RIGHT_FB = 26,
    XR_FACE_EXPRESSION_JAW_THRUST_FB = 27,
    XR_FACE_EXPRESSION_LID_TIGHTENER_L_FB = 28,
    XR_FACE_EXPRESSION_LID_TIGHTENER_R_FB = 29,
    XR_FACE_EXPRESSION_LIP_CORNER_DEPRESSOR_L_FB = 30,
    XR_FACE_EXPRESSION_LIP_CORNER_DEPRESSOR_R_FB = 31,
    XR_FACE_EXPRESSION_LIP_CORNER_PULLER_L_FB = 32,
    XR_FACE_EXPRESSION_LIP_CORNER_PULLER_R_FB = 33,
    XR_FACE_EXPRESSION_LIP_FUNNELER_LB_FB = 34,
    XR_FACE_EXPRESSION_LIP_FUNNELER_LT_FB = 35,
    XR_FACE_EXPRESSION_LIP_FUNNELER_RB_FB = 36,
    XR_FACE_EXPRESSION_LIP_FUNNELER_RT_FB = 37,
    XR_FACE_EXPRESSION_LIP_PRESSOR_L_FB = 38,
    XR_FACE_EXPRESSION_LIP_PRESSOR_R_FB = 39,
    XR_FACE_EXPRESSION_LIP_PUCKER_L_FB = 40,
    XR_FACE_EXPRESSION_LIP_PUCKER_R_FB = 41,
    XR_FACE_EXPRESSION_LIP_STRETCHER_L_FB = 42,
    XR_FACE_EXPRESSION_LIP_STRETCHER_R_FB = 43,
    XR_FACE_EXPRESSION_LIP_SUCK_LB_FB = 44,
    XR_FACE_EXPRESSION_LIP_SUCK_LT_FB = 45,
    XR_FACE_EXPRESSION_LIP_SUCK_RB_FB = 46,
    XR_FACE_EXPRESSION_LIP_SUCK_RT_FB = 47,
```

```
    XR_FACE_EXPRESSION_LIP_TIGHTENER_L_FB = 48,
    XR_FACE_EXPRESSION_LIP_TIGHTENER_R_FB = 49,
    XR_FACE_EXPRESSION_LIPS_TOWARD_FB = 50,
    XR_FACE_EXPRESSION_LOWER_LIP_DEPRESSOR_L_FB = 51,
    XR_FACE_EXPRESSION_LOWER_LIP_DEPRESSOR_R_FB = 52,
    XR_FACE_EXPRESSION_MOUTH_LEFT_FB = 53,
    XR_FACE_EXPRESSION_MOUTH_RIGHT_FB = 54,
    XR_FACE_EXPRESSION_NOSE_WRINKLER_L_FB = 55,
    XR_FACE_EXPRESSION_NOSE_WRINKLER_R_FB = 56,
    XR_FACE_EXPRESSION_OUTER_BROW_RAISER_L_FB = 57,
    XR_FACE_EXPRESSION_OUTER_BROW_RAISER_R_FB = 58,
    XR_FACE_EXPRESSION_UPPER_LID_RAISER_L_FB = 59,
    XR_FACE_EXPRESSION_UPPER_LID_RAISER_R_FB = 60,
    XR_FACE_EXPRESSION_UPPER_LIP_RAISER_L_FB = 61,
    XR_FACE_EXPRESSION_UPPER_LIP_RAISER_R_FB = 62,
    XR_FACE_EXPRESSION_COUNT_FB = 63,
    XR_FACE_EXPRESSION_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceExpressionFB;
```

12.105.8. Conventions of confidence areas

This extension defines two separate areas of confidence.

```
// Provided by XR_FB_face_tracking
typedef enum XrFaceConfidenceFB {
    XR_FACE_CONFIDENCE_LOWER_FACE_FB = 0,
    XR_FACE_CONFIDENCE_UPPER_FACE_FB = 1,
    XR_FACE_CONFIDENCE_COUNT_FB = 2,
    XR_FACE_CONFIDENCE_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceConfidenceFB;
```

The "upper face" area represents everything above the upper lip, including eye, eyebrows + cheek, and nose. The "lower face" area represents everything under eyes, including mouth, chin + cheek, and nose. Cheek and nose areas contribute to both "upper face" and "lower face" areas.

New Object Types

- XrFaceTrackerFB

New Flag Types

New Enum Constants

XrObjectType enumeration is extended with:

- XR_OBJECT_TYPE_FACE_TRACKER_FB

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES_FB
- XR_TYPE_FACE_TRACKER_CREATE_INFO_FB
- XR_TYPE_FACE_EXPRESSION_INFO_FB
- XR_TYPE_FACE_EXPRESSION_WEIGHTS_FB

New Enums

- XrFaceExpressionFB
- XrFaceExpressionSetFB
- XrFaceConfidenceFB

New Structures

- XrSystemFaceTrackingPropertiesFB
- XrFaceTrackerCreateInfoFB
- XrFaceExpressionInfoFB
- XrFaceExpressionStatusFB
- XrFaceExpressionWeightsFB

New Functions

- xrCreateFaceTrackerFB
- xrDestroyFaceTrackerFB
- xrGetFaceExpressionWeightsFB

12.106.1. Overview

This extension enables applications to get weights of blend shapes. It also enables applications to render facial expressions in XR experiences.

It is recommended to choose this extension over the `XR_FB_face_tracking` extension, if it is supported by the runtime, because this extension provides the following two additional capabilities to the application:

- This extension provides additional seven blend shapes that estimate tongue movement.
- This extension allows an application and the runtime to communicate about the data sources that are used to estimate facial expression in a cooperative manner.

Face tracking data is sensitive personal information and is closely linked to personal privacy and integrity. Applications storing or transferring face tracking data **should** always ask the user for active and specific acceptance to do so.

If the runtime supports a permission system to control application access to the face tracker, then the runtime **must** set the `isValid` field to `XR_FALSE` on the supplied XrFaceExpressionWeights2FB structure until the user allows the application to access the face tracker. When the application access has been

allowed, the runtime **should** set `isValid` on the supplied XrFaceExpressionWeights2FB structure to `XR_TRUE`.

Some permission systems **may** control access to the eye tracking separately from access to the face tracking, even though the eyes are part of the face. In case the user denied tracking of the eyes, yet, allowed tracking of the face, then the runtime **must** set the `isEyeFollowingBlendshapesValid` field to `XR_FALSE` on the supplied XrFaceExpressionWeights2FB for indicating that eye tracking data is not available, but at the same time **may** set the `isValid` field to `XR_TRUE` on the supplied XrFaceExpressionWeights2FB for indicating that another part of the face is tracked properly.

12.106.2. Inspect system capability

```
// Provided by XR_FB_face_tracking2
typedef struct XrSystemFaceTrackingProperties2FB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsVisualFaceTracking;
    XrBool32           supportsAudioFaceTracking;
} XrSystemFaceTrackingProperties2FB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsVisualFaceTracking` is an `XrBool32`, indicating if the current system is capable of receiving face tracking input that is estimated based on visual data source.
- `supportsAudioFaceTracking` is an `XrBool32`, indicating if the current system is capable of receiving face tracking input that is estimated based on audio data source.

An application **can** inspect whether the system is capable of receiving face tracking input by extending the XrSystemProperties with XrSystemFaceTrackingProperties2FB structure when calling xrGetSystemProperties.

If an application calls xrCreateFaceTracker2FB only with unsupported XrFaceTrackerCreateInfo2FB ::`requestedDataSources`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFaceTracker2FB. For example, if an application calls xrCreateFaceTracker2FB only with `XR_FACE_TRACKING_DATA_SOURCE2_AUDIO_FB` in XrFaceTrackerCreateInfo2FB::`requestedDataSources` when the runtime returns `XR_FALSE` for `supportsAudioFaceTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFaceTracker2FB.

Valid Usage (Implicit)

- The XR_FB_face_tracking2 extension **must** be enabled prior to using XrSystemFaceTrackingProperties2FB
- type **must** be XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES2_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.106.3. Create a face tracker handle

The XrFaceTracker2FB handle represents the resources for face tracking.

```
// Provided by XR_FB_face_tracking2
XR_DEFINE_HANDLE(XrFaceTracker2FB)
```

This handle is used to obtain blend shapes using the xrGetFaceExpressionWeights2FB function.

The xrCreateFaceTracker2FB function is defined as:

```
// Provided by XR_FB_face_tracking2
XrResult xrCreateFaceTracker2FB(
    XrSession                                   session,
    const XrFaceTrackerCreateInfo2FB*           createInfo,
    XrFaceTracker2FB*                           faceTracker);
```

Parameter Descriptions

- session is an XrSession in which the face tracker will be active.
- createInfo is the XrFaceTrackerCreateInfo2FB used to specify the face tracker.
- faceTracker is the returned XrFaceTracker2FB handle.

An application **can** create an XrFaceTracker2FB handle using xrCreateFaceTracker2FB function.

If the system does not support face tracking, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrCreateFaceTracker2FB. In this case, the runtime **must** return XR_FALSE for both XrSystemFaceTrackingProperties2FB::supportsVisualFaceTracking and XrSystemFaceTrackingProperties2FB::supportsAudioFaceTracking when the function xrGetSystemProperties is called, so that the application **can** avoid creating a face tracker.

Valid Usage (Implicit)

- The XR_FB_face_tracking2 extension **must** be enabled prior to calling xrCreateFaceTracker2FB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrFaceTrackerCreateInfo2FB structure
- faceTracker **must** be a pointer to an XrFaceTracker2FB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrFaceTrackerCreateInfo2FB structure is described as follows:

```
// Provided by XR_FB_face_tracking2
typedef struct XrFaceTrackerCreateInfo2FB {
    XrStructureType                 type;
    const void*                     next;
    XrFaceExpressionSet2FB          faceExpressionSet;
    uint32_t                        requestedDataSourceCount;
    XrFaceTrackingDataSource2FB*    requestedDataSources;
} XrFaceTrackerCreateInfo2FB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `faceExpressionSet` is an XrFaceExpressionSet2FB that describes the set of blend shapes to retrieve.
- `requestedDataSourceCount` is the number of elements in the `requestedDataSources` array.
- `requestedDataSources` is an array of XrFaceTrackingDataSource2FB that the application accepts. The order of values in the array has no significance.

The XrFaceTrackerCreateInfo2FB structure describes the information to create an XrFaceTracker2FB handle.

Runtimes **may** support a variety of data sources for estimations of facial expression, and some runtimes and devices **may** use data from multiple data sources. The application tells the runtime all data sources that the runtime **may** use to provide facial expressions for the application.

Because the device setting **may** change during a running session, the runtime **may** return a valid XrFaceTracker2FB handle even if the device is unable to estimate facial expression using the data sources requested by the application's call to xrCreateFaceTracker2FB. The runtime **must** instead return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFaceTracker2FB, if for example the runtime believes it will never be able to satisfy the request.

If `requestedDataSourceCount` is `0`, the runtime **may** choose any supported data source, preferably one that is more expressive than the others.

If any value in `requestedDataSources` is duplicated the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` from the call to xrCreateFaceTracker2FB.

Valid Usage (Implicit)

- The `XR_FB_face_tracking2` extension **must** be enabled prior to using XrFaceTrackerCreateInfo2FB
- `type` **must** be `XR_TYPE_FACE_TRACKER_CREATE_INFO2_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `faceExpressionSet` **must** be a valid XrFaceExpressionSet2FB value
- If `requestedDataSourceCount` is not `0`, `requestedDataSources` **must** be a pointer to an array of `requestedDataSourceCount` XrFaceTrackingDataSource2FB values

The XrFaceExpressionSet2FB enum describes the set of blend shapes of a facial expression to track when creating an XrFaceTracker2FB.

```
// Provided by XR_FB_face_tracking2
typedef enum XrFaceExpressionSet2FB {
    XR_FACE_EXPRESSION_SET2_DEFAULT_FB = 0,
    XR_FACE_EXPRESSION_SET_2FB_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceExpressionSet2FB;
```

Enumerant Descriptions

- XR_FACE_EXPRESSION_SET2_DEFAULT_FB — indicates that the created XrFaceTracker2FB tracks the set of blend shapes described by XrFaceExpression2FB enum, i.e. the xrGetFaceExpressionWeights2FB function returns an array of blend shapes with the count of XR_FACE_EXPRESSION2_COUNT_FB and **can** be indexed using XrFaceExpression2FB.

The XrFaceTrackingDataSource2FB enumeration is defined as:

```
// Provided by XR_FB_face_tracking2
typedef enum XrFaceTrackingDataSource2FB {
    XR_FACE_TRACKING_DATA_SOURCE2_VISUAL_FB = 0,
    XR_FACE_TRACKING_DATA_SOURCE2_AUDIO_FB = 1,
    XR_FACE_TRACKING_DATA_SOURCE_2FB_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceTrackingDataSource2FB;
```

Enumerant Descriptions

- XR_FACE_TRACKING_DATA_SOURCE2_VISUAL_FB - This value indicates that the face tracking data source supports using visual data to estimate facial expression. The runtime **may** also use audio to further improve the quality of the tracking.
- XR_FACE_TRACKING_DATA_SOURCE2_AUDIO_FB - This value indicates that the face tracking data source supports using audio data to estimate facial expression. The runtime **must** not use visual data for this data source.

12.106.4. Delete a face tracker handle

The xrDestroyFaceTracker2FB function is defined as:

```
// Provided by XR_FB_face_tracking2
XrResult xrDestroyFaceTracker2FB(
    XrFaceTracker2FB                            faceTracker);
```

Parameter Descriptions

- `faceTracker` is an XrFaceTracker2FB previously created by xrCreateFaceTracker2FB.

The xrDestroyFaceTracker2FB function releases the `faceTracker` and the underlying resources when face tracking experience is over.

Valid Usage (Implicit)

- The `XR_FB_face_tracking2` extension **must** be enabled prior to calling xrDestroyFaceTracker2FB
- `faceTracker` **must** be a valid XrFaceTracker2FB handle

Thread Safety

- Access to `faceTracker`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

12.106.5. Obtain facial expressions

The xrGetFaceExpressionWeights2FB function is defined as:

```
// Provided by XR_FB_face_tracking2
XrResult xrGetFaceExpressionWeights2FB(
    XrFaceTracker2FB                            faceTracker,
    const XrFaceExpressionInfo2FB*              expressionInfo,
    XrFaceExpressionWeights2FB*                 expressionWeights);
```

Parameter Descriptions

- `faceTracker` is an XrFaceTracker2FB previously created by xrCreateFaceTracker2FB.
- `expressionInfo` is a pointer to XrFaceExpressionInfo2FB describing information to obtain face expression.
- `expressionWeights` is a pointer to XrFaceExpressionWeights2FB receiving the returned facial expression weights.

The xrGetFaceExpressionWeights2FB function return blend shapes of facial expression at a given time.

Valid Usage (Implicit)

- The `XR_FB_face_tracking2` extension **must** be enabled prior to calling xrGetFaceExpressionWeights2FB
- `faceTracker` **must** be a valid XrFaceTracker2FB handle
- `expressionInfo` **must** be a pointer to a valid XrFaceExpressionInfo2FB structure
- `expressionWeights` **must** be a pointer to an XrFaceExpressionWeights2FB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrFaceExpressionInfo2FB structure is defined as:

```
// Provided by XR_FB_face_tracking2
typedef struct XrFaceExpressionInfo2FB {
    XrStructureType    type;
    const void*        next;
    XrTime             time;
} XrFaceExpressionInfo2FB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- time is an XrTime at which the facial expression weights are requested.

The XrFaceExpressionInfo2FB structure describes the information to obtain facial expression. The application **should** pass a time equal to the predicted display time for the rendered frame. The system **must** employ appropriate modeling to provide expressions for this time.

Valid Usage (Implicit)

- The XR_FB_face_tracking2 extension **must** be enabled prior to using XrFaceExpressionInfo2FB
- type **must** be XR_TYPE_FACE_EXPRESSION_INFO2_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrFaceExpressionWeights2FB structure is defined as:

```
// Provided by XR_FB_face_tracking2
typedef struct XrFaceExpressionWeights2FB {
    XrStructureType                type;
    void*                          next;
    uint32_t                       weightCount;
    float*                         weights;
    uint32_t                       confidenceCount;
    float*                         confidences;
    XrBool32                       isValid;
    XrBool32                       isEyeFollowingBlendshapesValid;
    XrFaceTrackingDataSource2FB    dataSource;
    XrTime                         time;
} XrFaceExpressionWeights2FB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `weightCount` is a `uint32_t` describing the count of elements in `weights` array.
- `weights` is a pointer to an application-allocated array of `float` that will be filled with weights of facial expression blend shapes.
- `confidenceCount` is a `uint32_t` describing the count of elements in `confidences` array.
- `confidences` is a pointer to an application-allocated array of `float` that will be filled with confidence of tracking specific parts of a face.
- `isValid` is an `XrBool32` which indicates that the tracked expression weights are valid.
- `isEyeFollowingBlendshapesValid` is an `XrBool32` which indicates if the 8 expression weights with prefix `XR_FACE_EXPRESSION2_EYES_LOOK_*` are valid.
- `dataSource` is an XrFaceTrackingDataSource2FB which indicates the data source that was used to estimate the facial expression.
- `time` is an `XrTime` time at which the returned expression weights are tracked or extrapolated to. Equals the time at which the expression weights were requested if the extrapolating at the time was successful.

XrFaceExpressionWeights2FB structure returns the facial expression.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `weightCount` is not equal to the number of blend shapes defined by the XrFaceExpressionSet2FB used to create the XrFaceTracker2FB.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `confidenceCount` is not equal to the number of confidence areas defined by the XrFaceExpressionSet2FB used to create the XrFaceTracker2FB.

A special case applies when XrFaceTrackingVisemesMETA is added to the `next` chain. In this scenario, `weightCount` and `confidenceCount` can be set to 0 to indicate that only visemes are requested. In such cases, it is not necessary to assign pointers to the `weights` and `confidences`.

The runtime **must** return `weights` representing the weights of blend shapes of current facial expression. Each weight is a normalized value in the range [0, 1], where 0 indicates the blend shape is not active and 1 indicates the blend shape is fully active.

The runtime **must** update the `weights` array ordered so that the application **can** index elements using the corresponding facial expression enum (e.g. XrFaceExpression2FB) as described by XrFaceExpressionSet2FB when creating the XrFaceTracker2FB. For example, when the XrFaceTracker2FB is created with `XR_FACE_EXPRESSION_SET2_DEFAULT_FB`, the application sets the `weightCount` to `XR_FACE_EXPRESSION2_COUNT_FB`, and the runtime **must** fill the `weights` array ordered so

that it **can** be indexed by the XrFaceExpression2FB enum.

The runtime **must** update the `confidences` array ordered so that the application **can** index elements using the corresponding confidence area enum (e.g. XrFaceConfidence2FB) as described by XrFaceExpressionSet2FB when creating the XrFaceTracker2FB. For example, when the XrFaceTracker2FB is created with `XR_FACE_EXPRESSION_SET2_DEFAULT_FB`, the application sets the `confidenceCount` to `XR_FACE_CONFIDENCE2_COUNT_FB`, and the runtime **must** fill the `confidences` array ordered so that it **can** be indexed by the XrFaceConfidence2FB enum.

The runtime **must** set `isValid` to `XR_FALSE` and it **must** also set all elements of `weights` to zero, if one of the following is true:

- the face tracker failed to track or lost track of the face
- the application lost focus
- the consent for face tracking was denied
- the runtime is unable to estimate facial expression from the data sources specified when xrCreateFaceTracker2FB function was called

If the returned `isValid` is `XR_TRUE`, the runtime **must** return all weights (or all weights except eyes related weights, see `isEyeFollowingBlendshapesValid`).

The runtime **must** set `isEyeFollowingBlendshapesValid` to `XR_FALSE` and it **must** also set 8 expression weights with prefix `XR_FACE_EXPRESSION2_EYES_LOOK_*` to zero, if one of the following is true:

- the eye tracking driving blendshapes with prefix `XR_FACE_EXPRESSION2_EYES_LOOK_*` lost track
- the consent for eye tracking was denied

Valid Usage (Implicit)

- The `XR_FB_face_tracking2` extension **must** be enabled prior to using XrFaceExpressionWeights2FB
- `type` **must** be `XR_TYPE_FACE_EXPRESSION_WEIGHTS2_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrFaceTrackingVisemesMETA
- `weights` **must** be a pointer to an array of `weightCount` `float` values
- `confidences` **must** be a pointer to an array of `confidenceCount` `float` values
- `dataSource` **must** be a valid XrFaceTrackingDataSource2FB value
- The `weightCount` parameter **must** be greater than `0`
- The `confidenceCount` parameter **must** be greater than `0`

12.106.6. Example code for obtaining facial expression

The following example code demonstrates how to obtain all weights for facial expression blend shapes.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// Confirm face tracking system support.
XrSystemFaceTrackingProperties2FB faceTrackingSystemProperties{
    .type = XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES2_FB,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &faceTrackingSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));

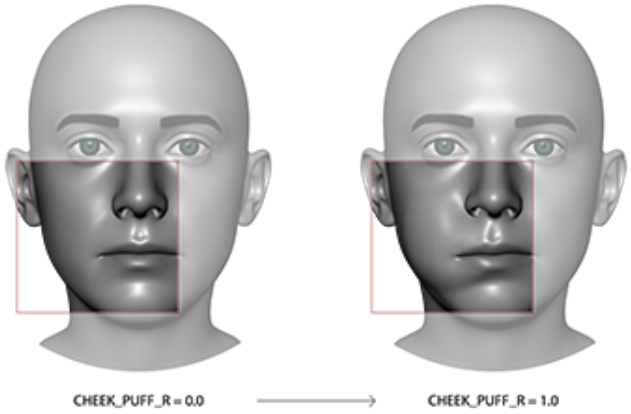
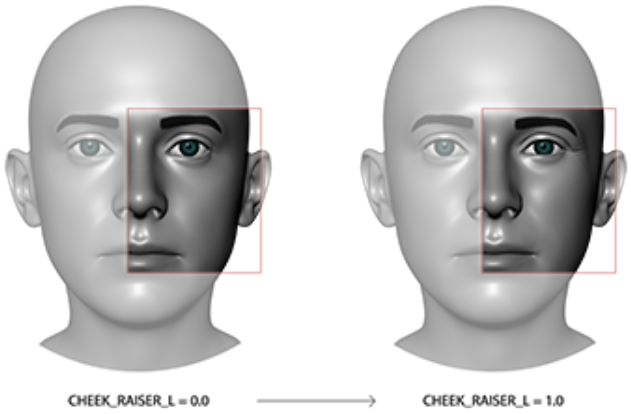
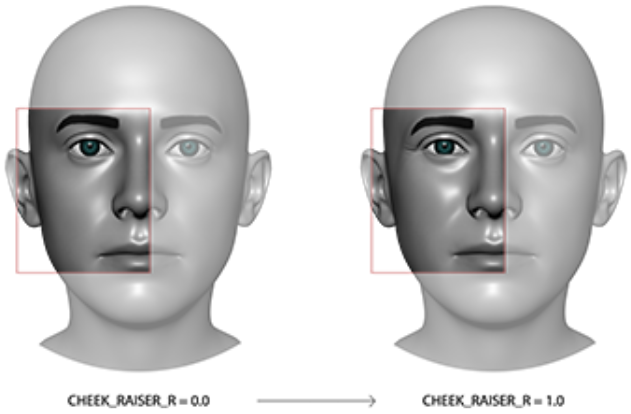
} XrFaceExpression2FB;
```



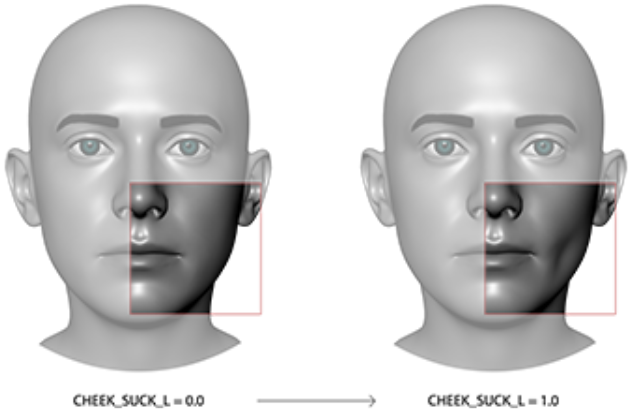
`XR_FACE_EXPRESSION2_BROW_LOWERER_L_FB` knits and lowers the left brow area and lowers central forehead.



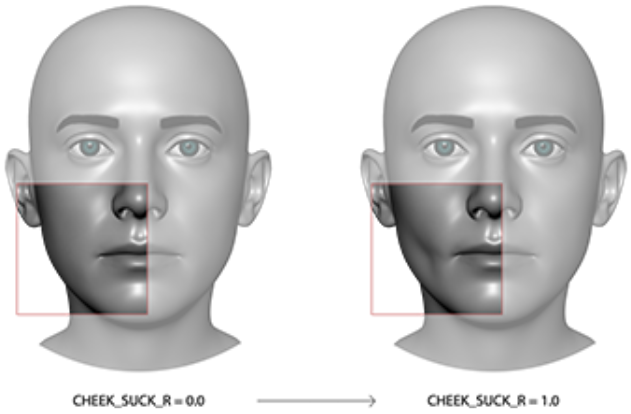
`XR_FACE_EXPRESSION2_BROW_LOWERER_R_FB` knits and lowers the right brow area and lowers central forehead.



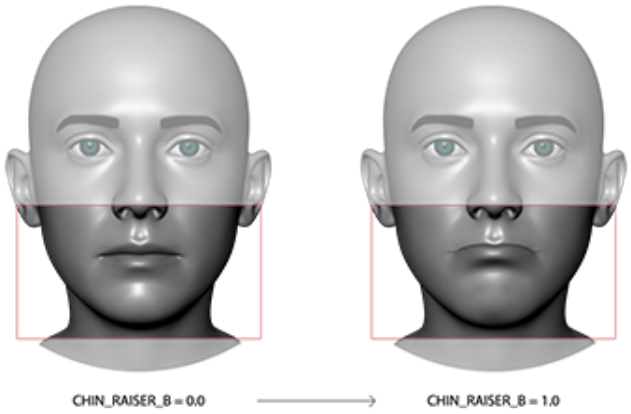
`XR_FACE_EXPRESSION2_CHEEK_PUFF_L_FB` fills the left cheek with air causing them to round and extend outward.



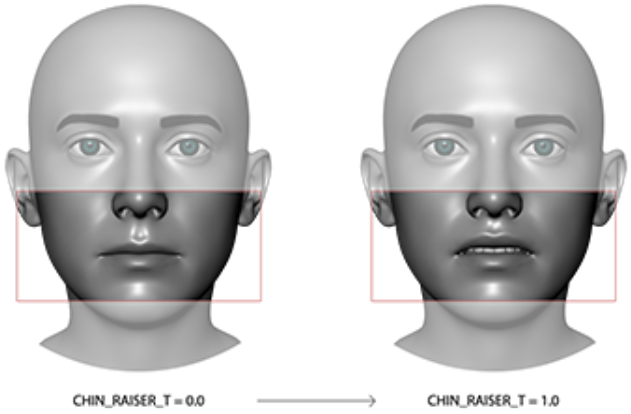
XR_FACE_EXPRESSION2_CHEEK_PUFF_R_FB fills the right cheek with air causing them to round and extend outward.



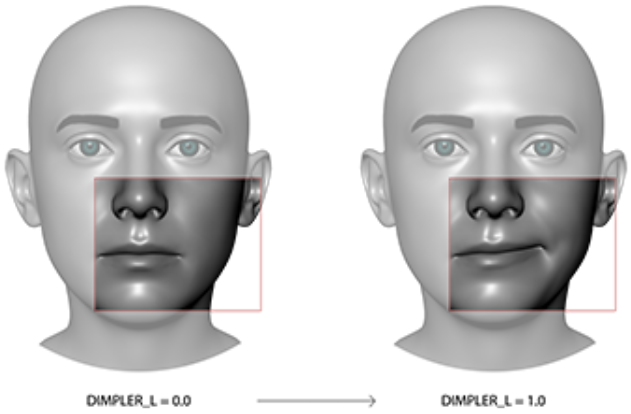
XR_FACE_EXPRESSION2_CHEEK_RAISER_L_FB tightens the outer rings of the left eye orbit and squeezes the lateral left eye corners.



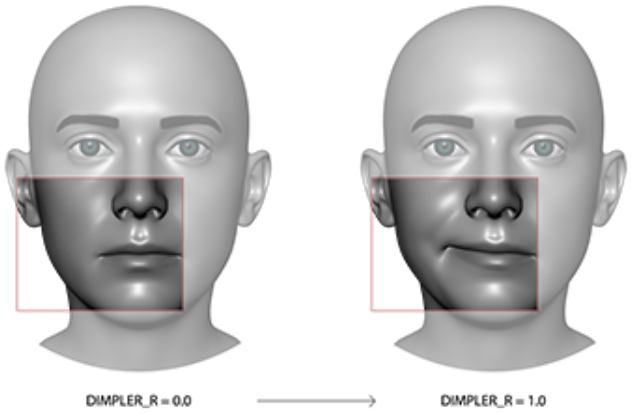
XR_FACE_EXPRESSION2_CHEEK_RAISER_R_FB tightens the outer rings of the right eye orbit and squeezes the lateral right eye corners.



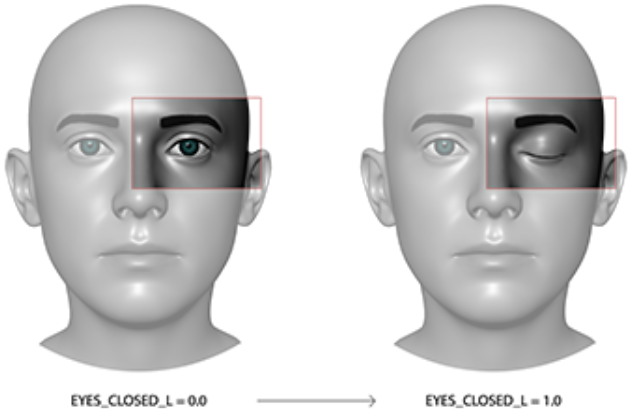
`XR_FACE_EXPRESSION2_CHEEK_SUCK_L_FB` sucks the left cheek inward and against the teeth to create a hollow effect in the cheek.



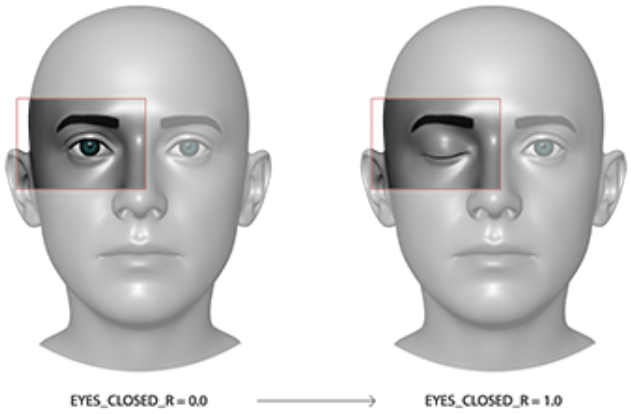
`XR_FACE_EXPRESSION2_CHEEK_SUCK_R_FB` sucks the right cheek inward and against the teeth to create a hollow effect in the cheek.



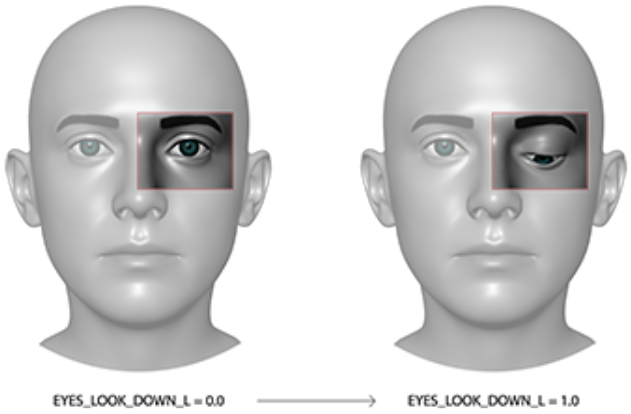
`XR_FACE_EXPRESSION2_CHIN_RAISER_B_FB` pushes the skin of the chin and the lower lip upward.



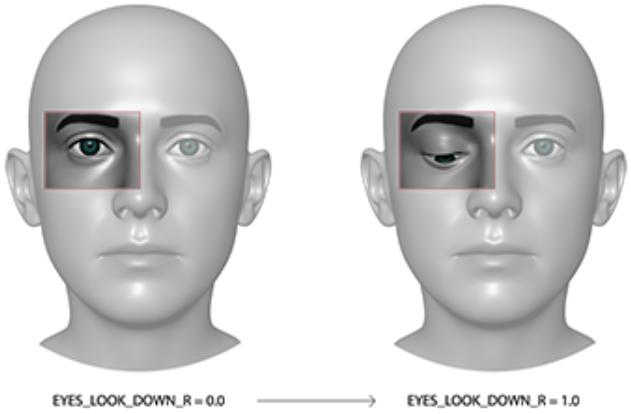
`XR_FACE_EXPRESSION2_CHIN_RAISER_T_FB` pushes up the top lip. This is induced by the upward force from `XR_FACE_EXPRESSION2_CHIN_RAISER_B_FB`.



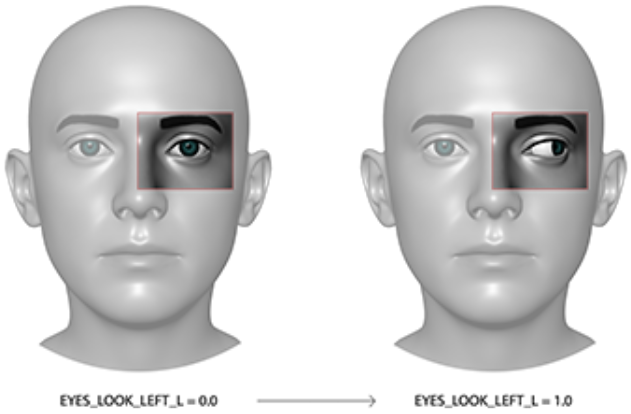
`XR_FACE_EXPRESSION2_DIMPLER_L_FB` pinches the left lip corner against the teeth, drawing them slightly backward and often upward in the process.



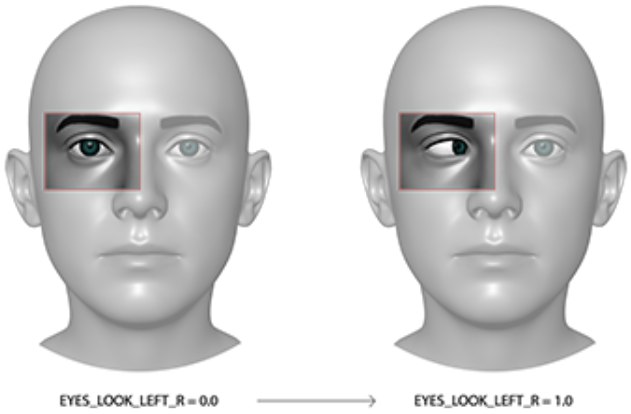
`XR_FACE_EXPRESSION2_DIMPLER_R_FB` pinches the right lip corner against the teeth, drawing them slightly backward and often upward in the process.



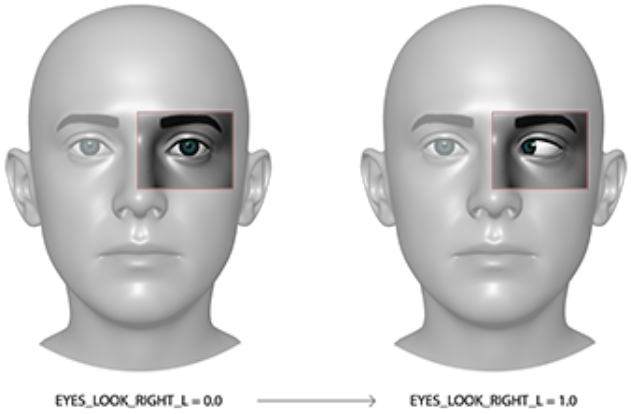
`XR_FACE_EXPRESSION2_EYES_CLOSED_L_FB` lowers the top eyelid to cover the left eye.



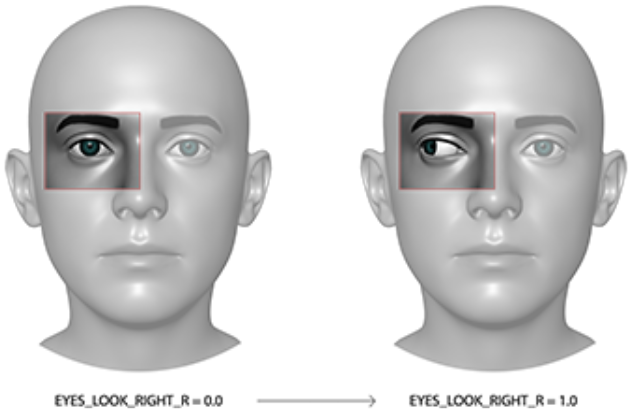
`XR_FACE_EXPRESSION2_EYES_CLOSED_R_FB` lowers the top eyelid to cover the right eye.



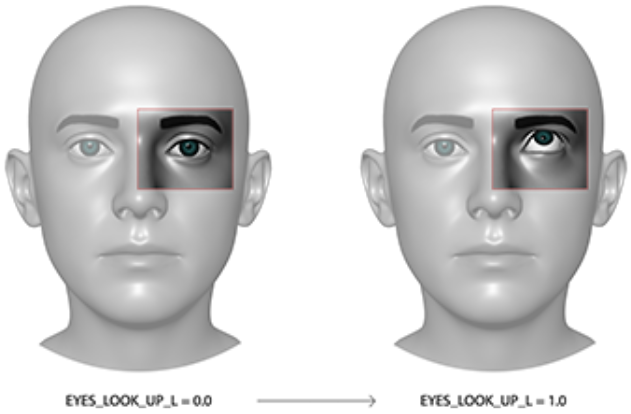
`XR_FACE_EXPRESSION2_EYES_LOOK_DOWN_L_FB` moves the left eye consistent with downward gaze.



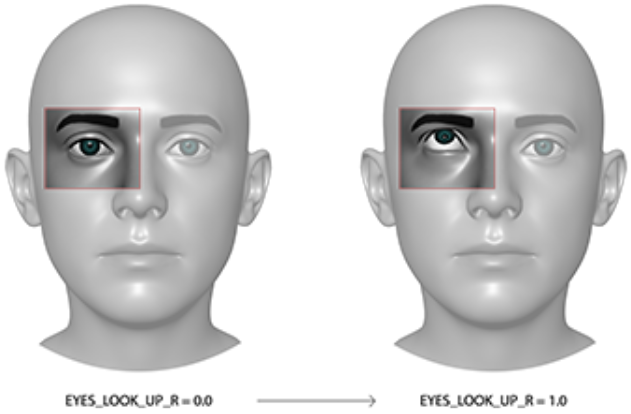
XR_FACE_EXPRESSION2_EYES_LOOK_DOWN_R_FB moves the right eye consistent with downward gaze.



XR_FACE_EXPRESSION2_EYES_LOOK_LEFT_L_FB moves the left eye consistent with leftward gaze.

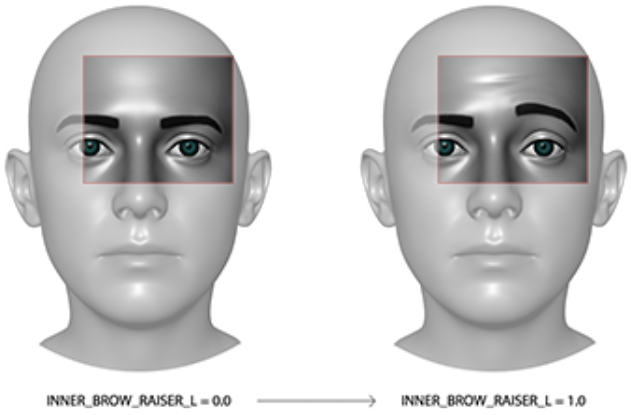


XR_FACE_EXPRESSION2_EYES_LOOK_LEFT_R_FB moves the right eye consistent with leftward gaze.

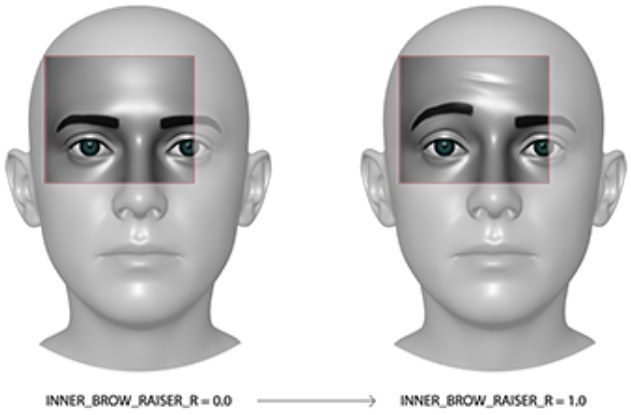


`XR_FACE_EXPRESSION2_EYES_LOOK_RIGHT_L_FB` moves the left eye consistent with rightward gaze.

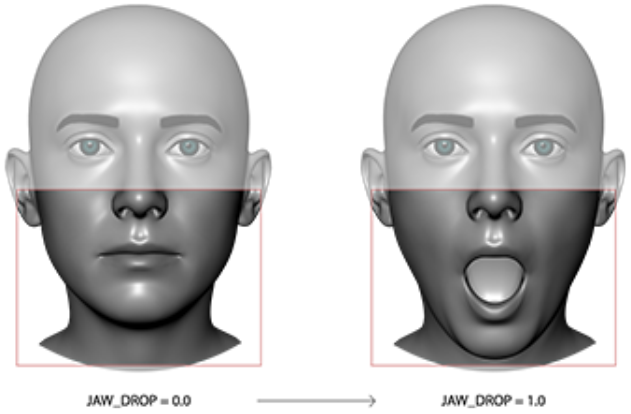
`XR_FACE_EXPRESSION2_EYES_LOOK_RIGHT_R_FB` moves the right eye consistent with rightward gaze.



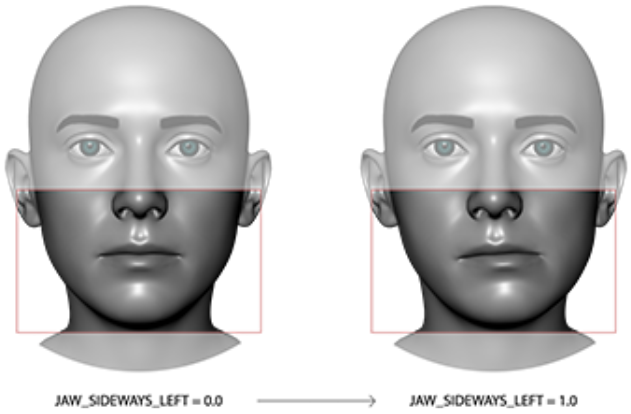
`XR_FACE_EXPRESSION2_EYES_LOOK_UP_L_FB` moves the left eye consistent with upward gaze.



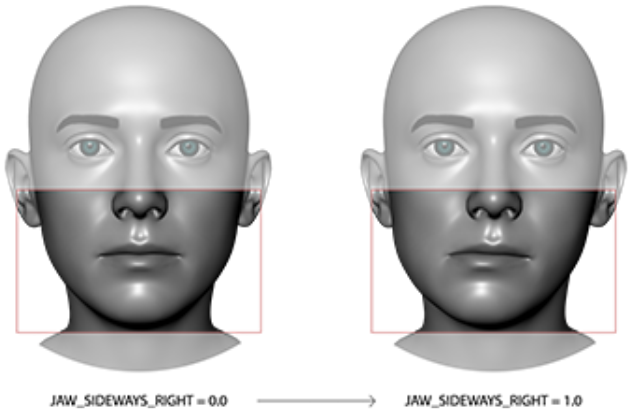
`XR_FACE_EXPRESSION2_EYES_LOOK_UP_R_FB` moves the right eye consistent with upward gaze.



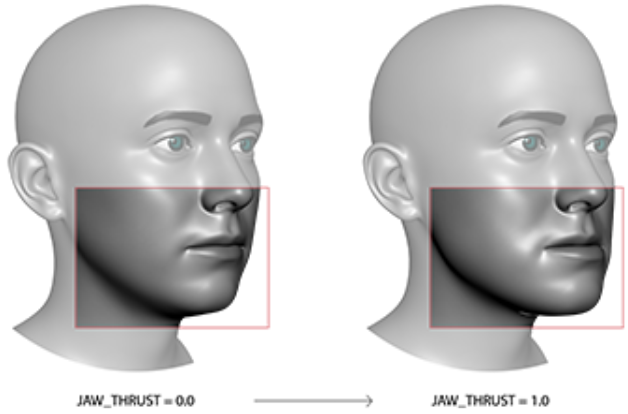
The eight `XR_FACE_EXPRESSION2_EYES_LOOK_*` blend shapes represent eye rotation as a linear mapping from angle to weight. A weight of 0 corresponds to the eye at its neutral forward position and a weight of 1 corresponds to the eye rotated to its maximum angle in the given direction. For opposing directions (e.g. left vs right), only one of the pair will be non-zero at any given time.



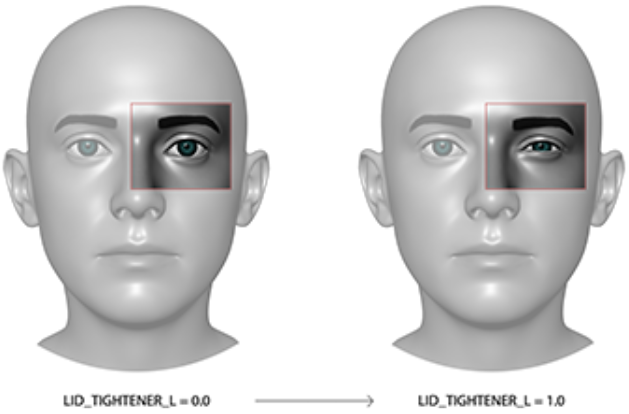
`XR_FACE_EXPRESSION2_INNER_BROW_RAISER_L_FB` lifts the left medial brow and forehead area.



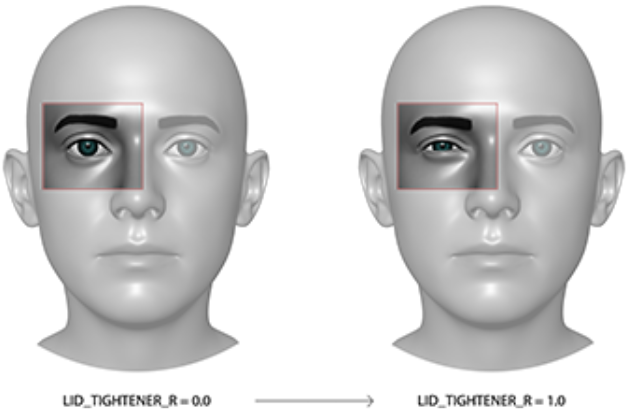
`XR_FACE_EXPRESSION2_INNER_BROW_RAISER_R_FB` lifts the right medial brow and forehead area.



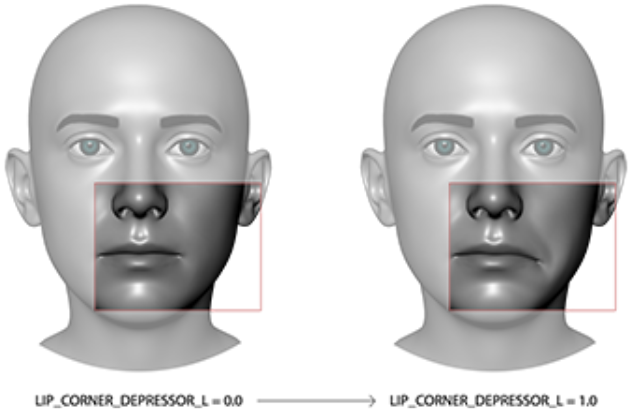
`XR_FACE_EXPRESSION2_JAW_DROP_FB` moves the lower mandible downward and toward the neck.



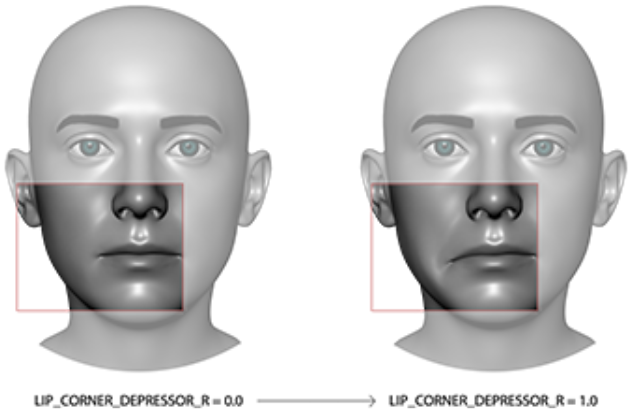
`XR_FACE_EXPRESSION2_JAW_SIDEWAYS_LEFT_FB` moves the lower mandible leftward.



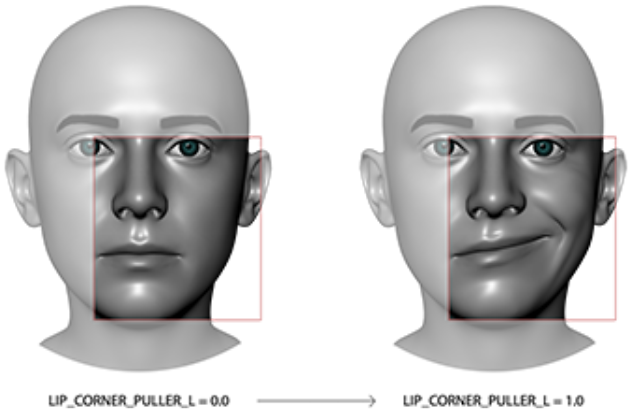
`XR_FACE_EXPRESSION2_JAW_SIDEWAYS_RIGHT_FB` moves the lower mandible rightward.



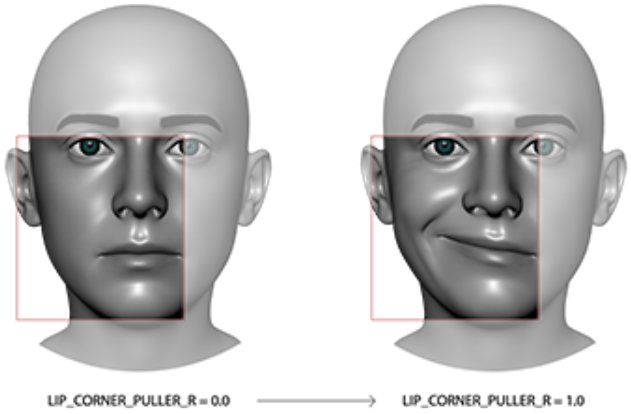
`XR_FACE_EXPRESSION2_JAW_THRUST_FB` projects the lower mandible forward.



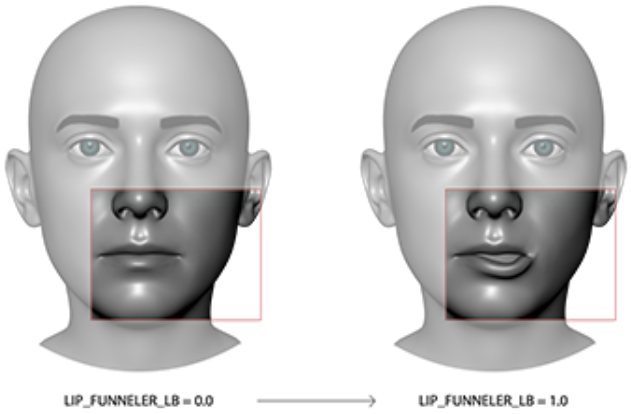
`XR_FACE_EXPRESSION2_LID_TIGHTENER_L_FB` tightens the rings around the left eyelid and pushes the lower eyelid skin toward the inner eye corners.



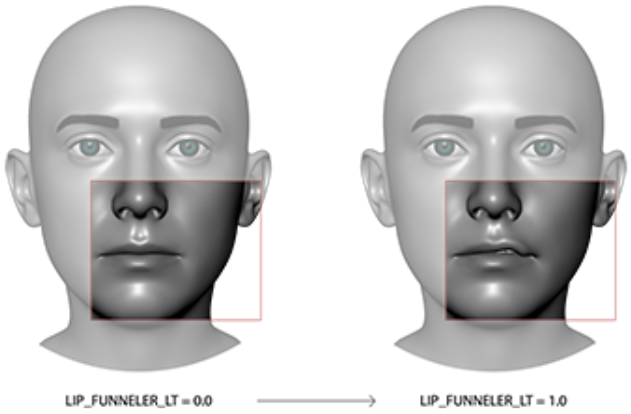
`XR_FACE_EXPRESSION2_LID_TIGHTENER_R_FB` tightens the rings around the right eyelid and pushes the lower eyelid skin toward the inner eye corners.



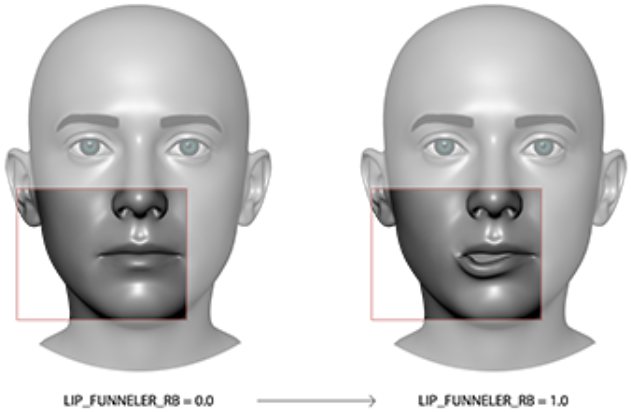
`XR_FACE_EXPRESSION2_LIP_CORNER_DEPRESSOR_L_FB` draws the left lip corner downward.



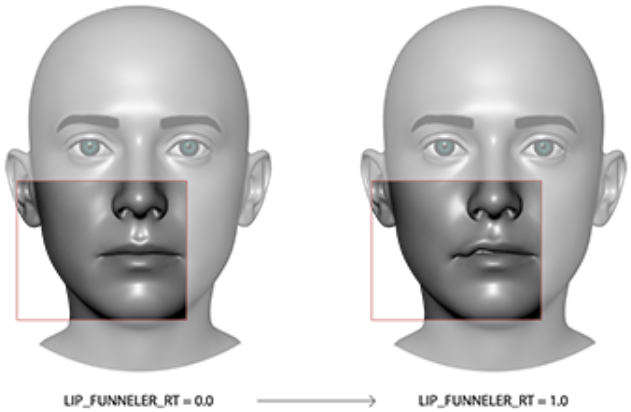
`XR_FACE_EXPRESSION2_LIP_CORNER_DEPRESSOR_R_FB` draws the right lip corner downward.



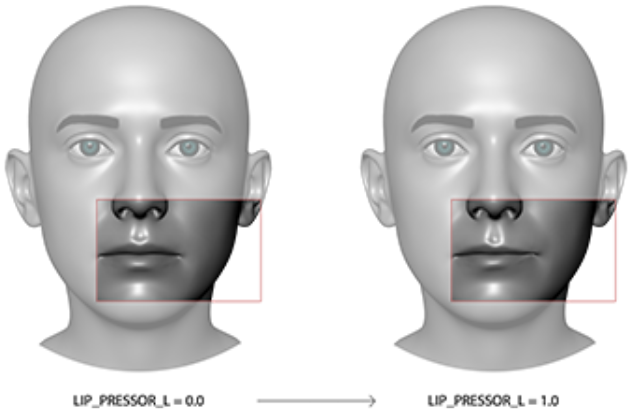
`XR_FACE_EXPRESSION2_LIP_CORNER_PULLER_L_FB` draws the left lip corners up, back, and laterally.



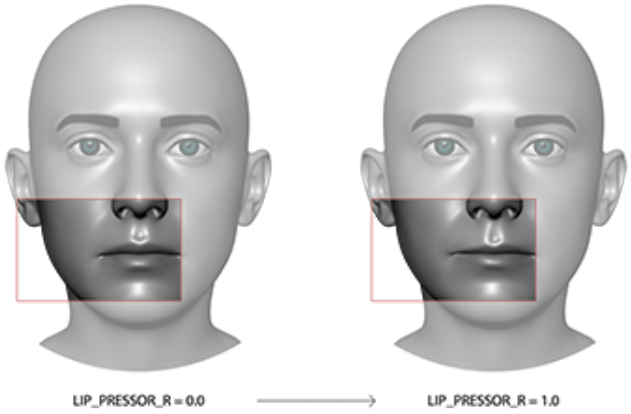
`XR_FACE_EXPRESSION2_LIP_CORNER_PULLER_R_FB` draws the right lip corners up, back, and laterally.

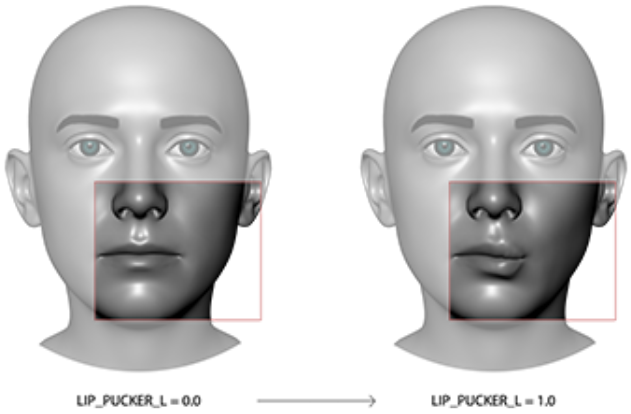


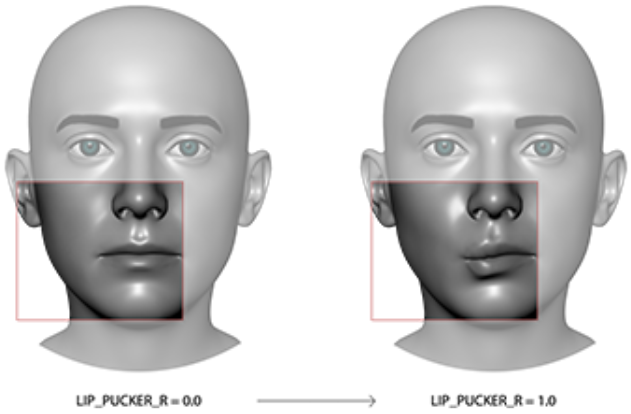
`XR_FACE_EXPRESSION2_LIP_FUNNELER_LB_FB` fans the left bottom lip outward in a forward projection, often rounding the mouth and separating the lips.



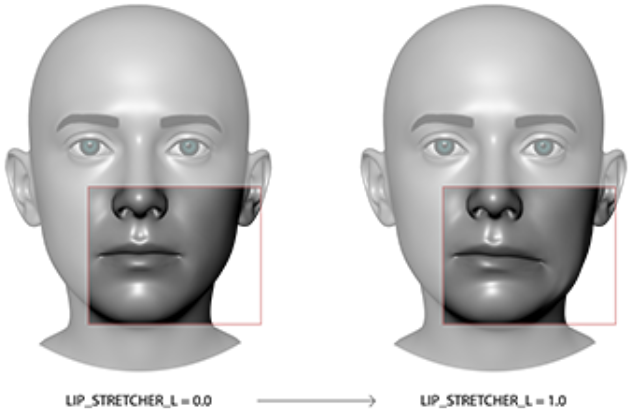
`XR_FACE_EXPRESSION2_LIP_FUNNELER_LT_FB` fans the left top lip outward in a forward projection, often rounding the mouth and separating the lips.



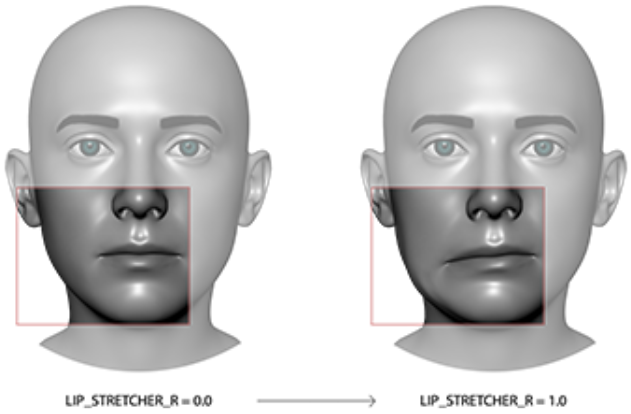




`XR_FACE_EXPRESSION2_LIP_FUNNELER_RB_FB` fans the right bottom lip outward in a forward projection, often rounding the mouth and separating the lips.

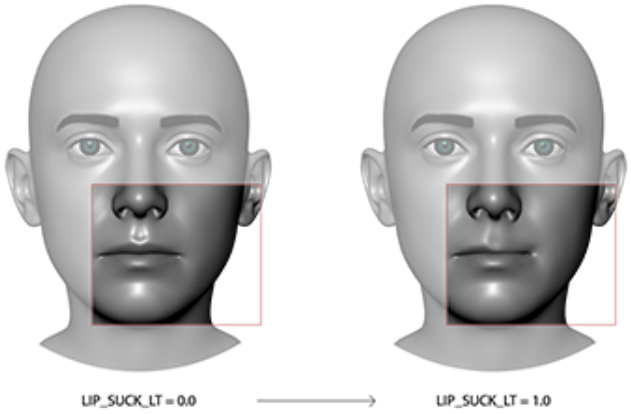


`XR_FACE_EXPRESSION2_LIP_FUNNELER_RT_FB` fans the right top lip outward in a forward projection, often rounding the mouth and separating the lips.

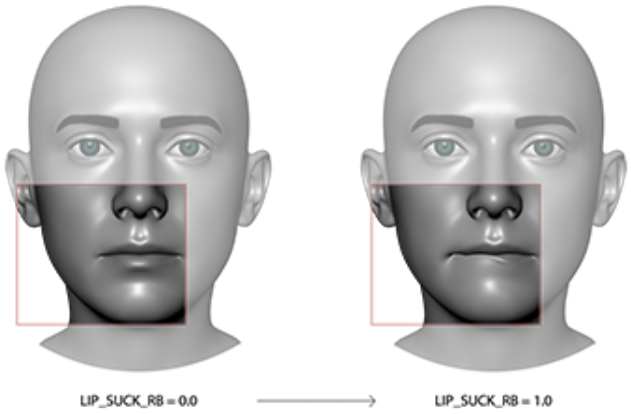


`XR_FACE_EXPRESSION2_LIP_PRESSOR_L_FB` presses the left upper and left lower lips against one another.

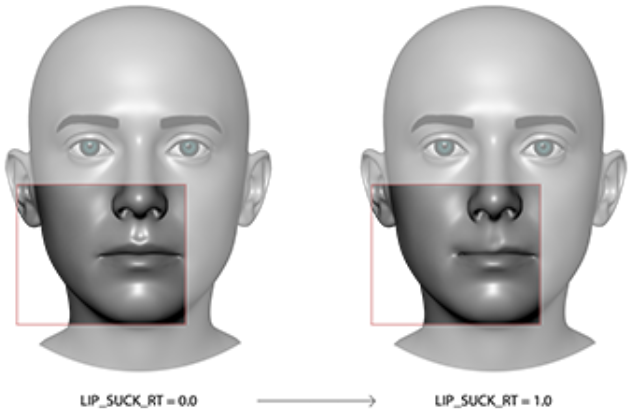
	`XR_FACE_EXPRESSION2_LIP_PRESSOR_R_FB` presses the right upper and right lower lips against one another.
	`XR_FACE_EXPRESSION2_LIP_PUCKER_L_FB` draws the left lip corners medially causing the lips protrude in the process.
	`XR_FACE_EXPRESSION2_LIP_PUCKER_R_FB` draws the right lip corners medially causing the lips protrude in the process.



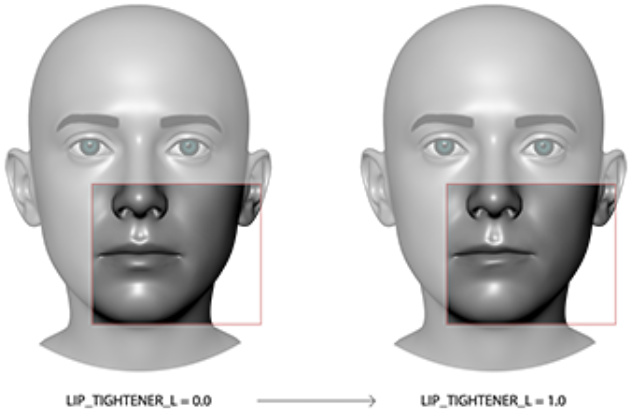
`XR_FACE_EXPRESSION2_LIP_STRETCHER_L_FB` draws the left lip corners laterally, stretching the lips and widening the jawline.



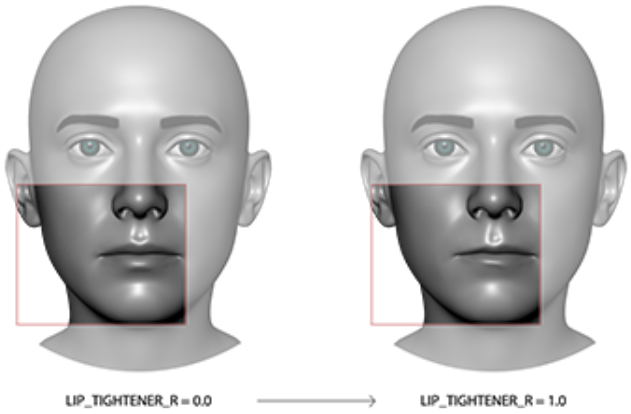
`XR_FACE_EXPRESSION2_LIP_STRETCHER_R_FB` draws the right lip corners laterally, stretching the lips and widening the jawline.



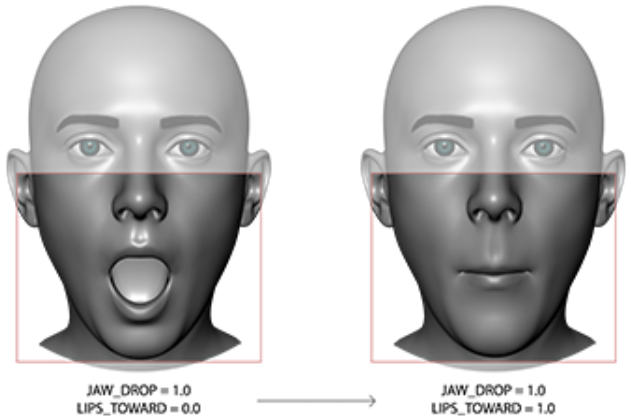
`XR_FACE_EXPRESSION2_LIP_SUCK_LB_FB` sucks the left bottom lip toward the inside of the mouth.



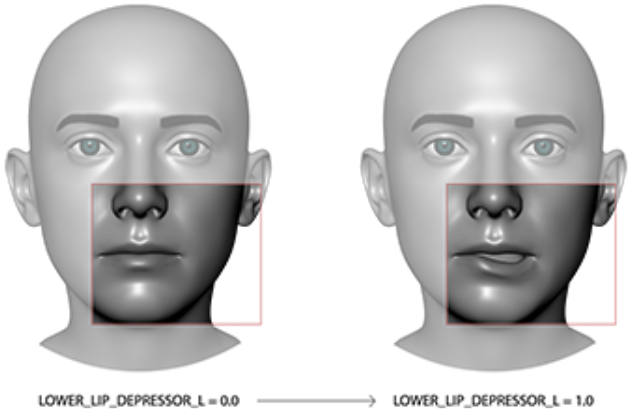
XR_FACE_EXPRESSION2_LIP_SUCK_LT_FB sucks the left top lip toward the inside of the mouth.



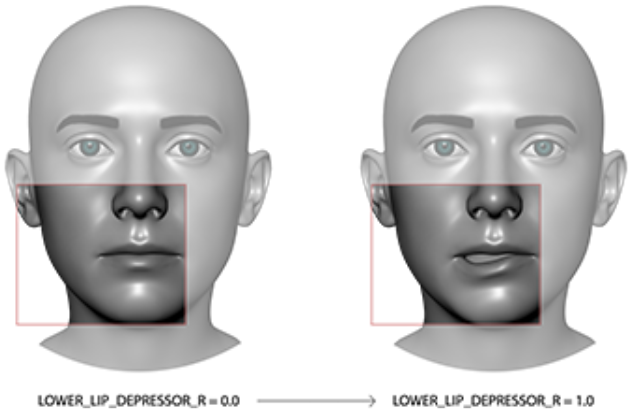
XR_FACE_EXPRESSION2_LIP_SUCK_RB_FB sucks the right bottom lip toward the inside of the mouth.



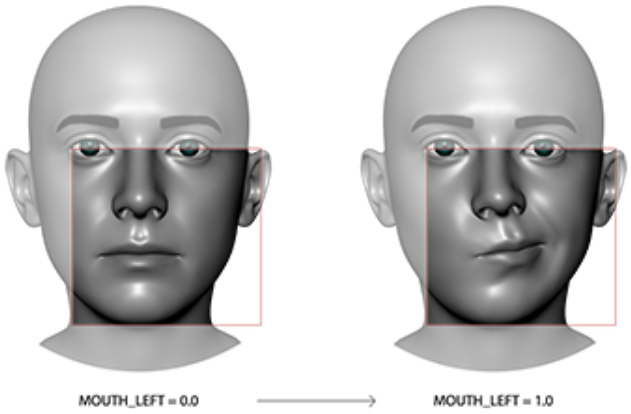
XR_FACE_EXPRESSION2_LIP_SUCK_RT_FB sucks the right top lip toward the inside of the mouth.



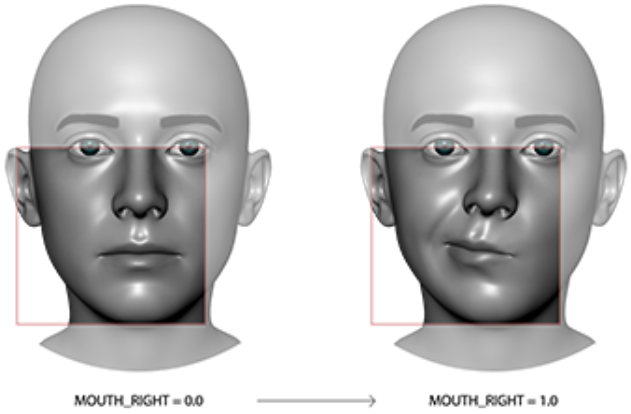
`XR_FACE_EXPRESSION2_LIP_TIGHTENER_L_FB` narrows or constricts the left lips on a horizontal plane.

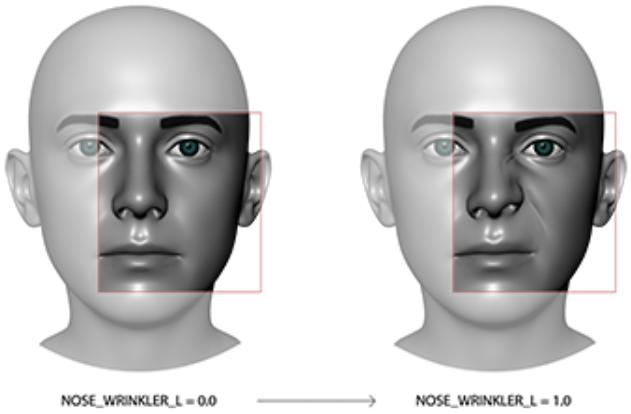


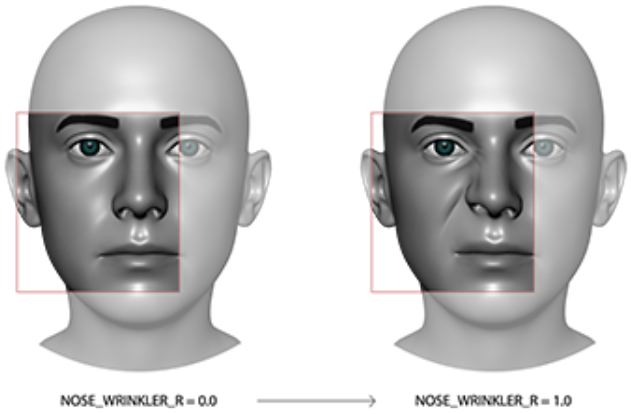
`XR_FACE_EXPRESSION2_LIP_TIGHTENER_R_FB` narrows or constricts the right lips on a horizontal plane.



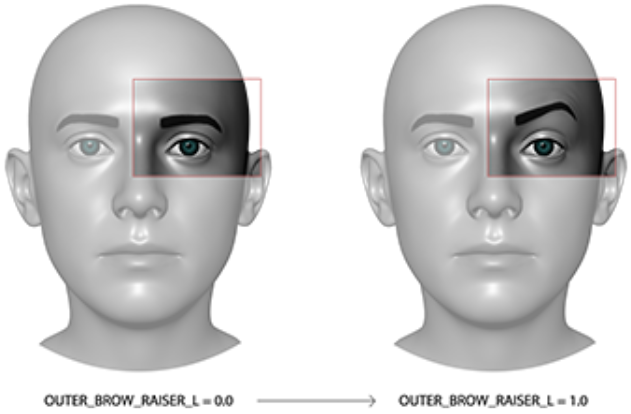
`XR_FACE_EXPRESSION2_LIPS_TOWARD_FB` forces contact between top and bottom lips to keep the mouth closed regardless of the position of the jaw.



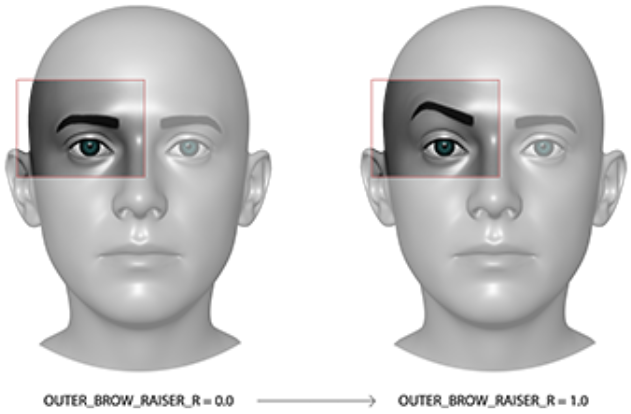




`XR_FACE_EXPRESSION2_LOWER_LIP_DEPRESSOR_L_FB` draws the left lower lip downward and slightly laterally.

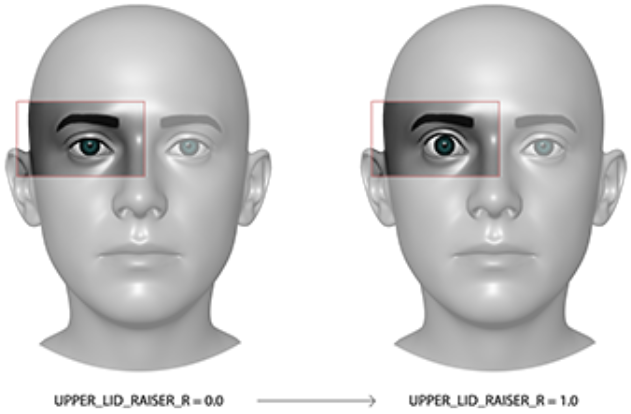


`XR_FACE_EXPRESSION2_LOWER_LIP_DEPRESSOR_R_FB` draws the right lower lip downward and slightly laterally.

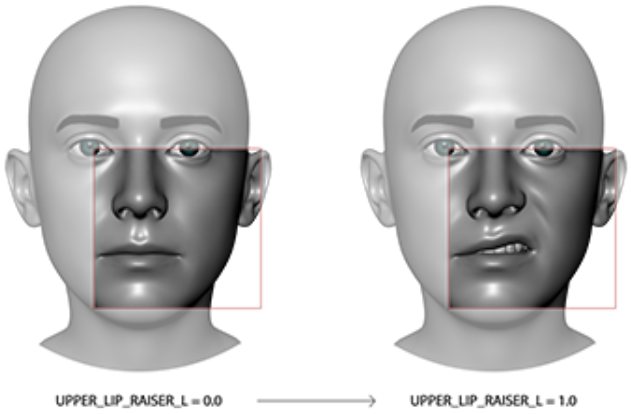


`XR_FACE_EXPRESSION2_MOUTH_LEFT_FB` pulls the left lip corner leftward and pushes the right side of the mouth toward the left lip corner.

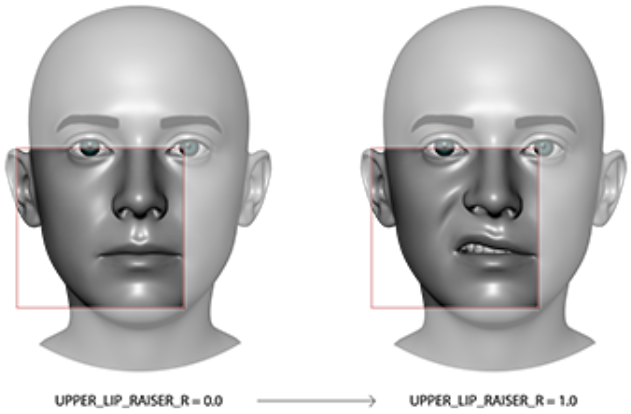
	`XR_FACE_EXPRESSION2_MOUTH_RIGHT_FB` pulls the right lip corner rightward and pushes the left side of the mouth toward the right lip corner.
	`XR_FACE_EXPRESSION2_NOSE_WRINKLER_L_FB` lifts the left sides of the nose, nostrils, and central upper lip area. Often pairs with brow lowering muscles to lower the medial brow tips.
	`XR_FACE_EXPRESSION2_NOSE_WRINKLER_R_FB` lifts the right sides of the nose, nostrils, and central upper lip area. Often pairs with brow lowering muscles to lower the medial brow tips.



`XR_FACE_EXPRESSION2_OUTER_BROW_RAISER_L_FB` lifts the lateral left brow and forehead areas.



`XR_FACE_EXPRESSION2_OUTER_BROW_RAISER_R_FB` lifts the lateral right brow and forehead areas.



`XR_FACE_EXPRESSION2_UPPER_LID_RAISER_L_FB` pulls the top left eyelid up and back to widen eyes.

`XR_FACE_EXPRESSION2_UPPER_LID_RAISER_R_FB` pulls the top right eyelid up and back to widen eyes.

`XR_FACE_EXPRESSION2_UPPER_LIP_RAISER_L_FB` lifts the top left lip (in a more lateral manner than nose wrinkler).

`XR_FACE_EXPRESSION2_UPPER_LIP_RAISER_R_FB` lifts the top right lip (in a more lateral manner than nose wrinkler).

	`XR_FACE_EXPRESSION2_TONGUE_TIP_INTERDENTAL_FB` raises the tip of the tongue to touch the top teeth like with the viseme "TH". The tongue is visible and slightly sticks out past the teeth line.
	`XR_FACE_EXPRESSION2_TONGUE_TIP_ALVEOLAR_FB` raises the tip of tongue to touch the back of the top teeth like in the viseme "NN".
	`XR_FACE_EXPRESSION2_TONGUE_FRONT_DORSAL_PALATE_FB` makes the front part of the tongue to press against the palate like in the viseme "CH".
	`XR_FACE_EXPRESSION2_TONGUE_MID_DORSAL_PALATE_FB` presses the middle of the tongue against the palate like in the viseme "DD".

	XR_FACE_EXPRESSION2_TONGUE_BACK_DORSAL_VELAR_FB presses the back of the tongue against the palate like in the viseme "KK".
	XR_FACE_EXPRESSION2_TONGUE_OUT_FB sticks the tongue out.
	XR_FACE_EXPRESSION2_TONGUE_RETREAT_FB pulls the tongue back in the throat and makes the tongue to stay down like in the viseme "AA".

12.106.8. Conventions of confidence areas

This extension defines two separate areas of confidence.

```
// Provided by XR_FB_face_tracking2
typedef enum XrFaceConfidence2FB {
    XR_FACE_CONFIDENCE2_LOWER_FACE_FB = 0,
    XR_FACE_CONFIDENCE2_UPPER_FACE_FB = 1,
    XR_FACE_CONFIDENCE2_COUNT_FB = 2,
    XR_FACE_CONFIDENCE_2FB_MAX_ENUM_FB = 0x7FFFFFFF
} XrFaceConfidence2FB;
```

The "upper face" area represents everything above the upper lip, including the eyes and eyebrows. The "lower face" area represents everything under the eyes, including the mouth and chin. Cheek and nose

areas contribute to both "upper face" and "lower face" areas.

New Object Types

- XrFaceTracker2FB

New Flag Types

New Enum Constants

XrObjectType enumeration is extended with:

- `XR_OBJECT_TYPE_FACE_TRACKER2_FB`

XrStructureType enumeration is extended with:

- `XR_TYPE_SYSTEM_FACE_TRACKING_PROPERTIES2_FB`
- `XR_TYPE_FACE_TRACKER_CREATE_INFO2_FB`
- `XR_TYPE_FACE_EXPRESSION_INFO2_FB`
- `XR_TYPE_FACE_EXPRESSION_WEIGHTS2_FB`

New Enums

- XrFaceExpression2FB
- XrFaceExpressionSet2FB
- XrFaceConfidence2FB
- XrFaceTrackingDataSource2FB

New Structures

- XrSystemFaceTrackingProperties2FB
- XrFaceTrackerCreateInfo2FB
- XrFaceExpressionInfo2FB
- XrFaceExpressionWeights2FB

New Functions

- xrCreateFaceTracker2FB
- xrDestroyFaceTracker2FB
- xrGetFaceExpressionWeights2FB

Issues

- Should we add the tongue shapes to `XR_FB_face_tracking` as a new enum value in

XrFaceExpressionSetFB?

- **Resolved.** We expect that all applications should use `XR_FB_face_tracking2` in the future and that `XR_FB_face_tracking` will ultimately be replaced by this extension.

Overview

Foveation in the context of XR is a rendering technique that allows the area of an image near the focal point or fovea of the eye to be displayed at higher resolution than areas in the periphery. This trades some visual fidelity in the periphery, where it is less noticeable for the user, for improved rendering performance, most notably regarding the fragment shader, as fewer pixels or subpixels in the

periphery need to be shaded and processed. On platforms which support foveation patterns and features tailored towards the optical properties, performance profiles, and hardware support of specific HMDs, application developers may request and use available foveation profiles from the runtime. Foveation profiles refer to a set of properties describing how, when, and where foveation will be applied.

This extension allows:

- An application to create swapchains that can support foveation for its graphics API.
- An application to request foveation profiles supported by the runtime and apply them to foveation-supported swapchains.

New Object Types

```
// Provided by XR_FB_foveation
XR_DEFINE_HANDLE(XrFoveationProfileFB)
```

XrFoveationProfileFB represents a set of properties and resources that define a foveation pattern for the runtime, which **can** be applied to individual swapchains.

New Flag Types

```
// Provided by XR_FB_foveation
typedef XrFlags64 XrSwapchainCreateFoveationFlagsFB;
```

```
// Provided by XR_FB_foveation
// Flag bits for XrSwapchainCreateFoveationFlagsFB
static const XrSwapchainCreateFoveationFlagsFB
XR_SWAPCHAIN_CREATE_FOVEATION_SCALED_BIN_BIT_FB = 0x00000001;
static const XrSwapchainCreateFoveationFlagsFB
XR_SWAPCHAIN_CREATE_FOVEATION_FRAGMENT_DENSITY_MAP_BIT_FB = 0x00000002;
```

Flag Descriptions

- XR_SWAPCHAIN_CREATE_FOVEATION_SCALED_BIN_BIT_FB — Explicitly create the swapchain with scaled bin foveation support. The application must ensure that the swapchain is using the OpenGL graphics API and that the QCOM_texture_foveated extension is supported and enabled.
- XR_SWAPCHAIN_CREATE_FOVEATION_FRAGMENT_DENSITY_MAP_BIT_FB — Explicitly create the swapchain with fragment density map foveation support. The application must ensure that the swapchain is using the Vulkan graphics API and that the VK_EXT_fragment_density_map extension is supported and enabled.

```
// Provided by XR_FB_foveation
typedef XrFlags64 XrSwapchainStateFoveationFlagsFB;
```

```
// Provided by XR_FB_foveation
// Flag bits for XrSwapchainStateFoveationFlagsFB
```

There are currently no foveation swapchain state flags. This is reserved for future use.

New Enum Constants

XrObjectType enumeration is extended with:

- XR_OBJECT_TYPE_FOVEATION_PROFILE_FB

XrStructureType enumeration is extended with:

- XR_TYPE_FOVEATION_PROFILE_CREATE_INFO_FB
- XR_TYPE_SWAPCHAIN_CREATE_INFO_FOVEATION_FB
- XR_TYPE_SWAPCHAIN_STATE_FOVEATION_FB

New Enums

New Structures

XrFoveationProfileCreateInfoFB **must** be provided when calling xrCreateFoveationProfileFB. The runtime **must** interpret XrFoveationProfileCreateInfoFB without any additional structs in its `next` chain as a request to create a foveation profile that will apply no foveation to any area of the swapchain.

The XrFoveationProfileCreateInfoFB structure is defined as:

```
// Provided by XR_FB_foveation
typedef struct XrFoveationProfileCreateInfoFB {
    XrStructureType    type;
    void*              next;
} XrFoveationProfileCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The `XR_FB_foveation` extension **must** be enabled prior to using XrFoveationProfileCreateInfoFB
- `type` **must** be `XR_TYPE_FOVEATION_PROFILE_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrFoveationLevelProfileCreateInfoFB

XrSwapchainCreateInfoFoveationFB **can** be provided in the `next` chain of XrSwapchainCreateInfo when calling xrCreateSwapchain to indicate to the runtime that the swapchain **must** be created with foveation support in the corresponding graphics API. XrSwapchainCreateInfoFoveationFB contains additional foveation-specific flags for swapchain creation.

The XrSwapchainCreateInfoFoveationFB structure is defined as:

```
// Provided by XR_FB_foveation
typedef struct XrSwapchainCreateInfoFoveationFB {
    XrStructureType                       type;
    void*                                 next;
    XrSwapchainCreateFoveationFlagsFB     flags;
} XrSwapchainCreateInfoFoveationFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrSwapchainCreateFoveationFlagBitsFB which indicate various characteristics for how foveation is enabled on the swapchain.

Valid Usage (Implicit)

- The `XR_FB_foveation` extension **must** be enabled prior to using XrSwapchainCreateInfoFoveationFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_CREATE_INFO_FOVEATION_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrSwapchainCreateFoveationFlagBitsFB values

XrSwapchainStateFoveationFB **can** be provided in place of XrSwapchainStateBaseHeaderFB when calling xrUpdateSwapchainFB to update the foveation properties of the swapchain. XrSwapchainCreateInfoFoveationFB contains the desired foveation profile and additional foveation specific flags for updating the swapchain.

The XrSwapchainStateFoveationFB structure is defined as:

```
// Provided by XR_FB_foveation
typedef struct XrSwapchainStateFoveationFB {
    XrStructureType                       type;
    void*                                 next;
    XrSwapchainStateFoveationFlagsFB      flags;
    XrFoveationProfileFB                  profile;
} XrSwapchainStateFoveationFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrSwapchainStateFoveationFlagBitsFB which indicate various characteristics of how and when the foveation properties of the swapchain **must** be updated.
- `profile` is an XrFoveationProfileFB defining the desired foveation properties to be applied to the swapchain.

Valid Usage (Implicit)

- The `XR_FB_foveation` extension **must** be enabled prior to using XrSwapchainStateFoveationFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_STATE_FOVEATION_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0`
- `profile` **must** be a valid XrFoveationProfileFB handle

New Functions

The xrCreateFoveationProfileFB function is defined as:

```
// Provided by XR_FB_foveation
XrResult xrCreateFoveationProfileFB(
    XrSession                                   session,
    const XrFoveationProfileCreateInfoFB*       createInfo,
    XrFoveationProfileFB*                       profile);
```

Parameter Descriptions

- `session` is the XrSession that created the swapchains to which this foveation profile will be applied.
- `createInfo` is a pointer to an XrFoveationProfileCreateInfoFB structure containing parameters to be used to create the foveation profile.
- `profile` is a pointer to a handle in which the created XrFoveationProfileFB is returned.

Creates an XrFoveationProfileFB handle. The returned foveation profile handle **may** be subsequently

used in API calls.

Valid Usage (Implicit)

- The XR_FB_foveation extension **must** be enabled prior to calling xrCreateFoveationProfileFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrFoveationProfileCreateInfoFB structure
- profile **must** be a pointer to an XrFoveationProfileFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyFoveationProfileFB function is defined as:

```
// Provided by XR_FB_foveation
XrResult xrDestroyFoveationProfileFB(
    XrFoveationProfileFB                        profile);
```

Parameter Descriptions

- profile is the XrFoveationProfileFB to destroy.

XrFoveationProfileFB handles are destroyed using xrDestroyFoveationProfileFB. A

XrFoveationProfileFB **may** be safely destroyed after being applied to a swapchain state using xrUpdateSwapchainFB without affecting the foveation parameters of the swapchain. The application is responsible for ensuring that it has no calls using profile in progress when the foveation profile is destroyed.

Valid Usage (Implicit)

- The `XR_FB_foveation` extension **must** be enabled prior to calling xrDestroyFoveationProfileFB
- `profile` **must** be a valid XrFoveationProfileFB handle

Thread Safety

- Access to `profile`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

Issues

Overview

On Facebook HMDs, developers **may** create foveation profiles generated by the runtime for the optical properties and performance profile of the specific HMD.

This extension allows:

- An application to request foveation profiles generated by the runtime for the current HMD.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_FOVEATION_LEVEL_PROFILE_CREATE_INFO_FB`

New Enums

The possible foveation levels are specified by the XrFoveationLevelFB enumeration:

```
// Provided by XR_FB_foveation_configuration
typedef enum XrFoveationLevelFB {
    XR_FOVEATION_LEVEL_NONE_FB = 0,
    XR_FOVEATION_LEVEL_LOW_FB = 1,
    XR_FOVEATION_LEVEL_MEDIUM_FB = 2,
    XR_FOVEATION_LEVEL_HIGH_FB = 3,
    XR_FOVEATION_LEVEL_MAX_ENUM_FB = 0x7FFFFFFF
} XrFoveationLevelFB;
```

Enumerant Descriptions

- XR_FOVEATION_LEVEL_NONE_FB — No foveation
- XR_FOVEATION_LEVEL_LOW_FB — Less foveation (higher periphery visual fidelity, lower performance)
- XR_FOVEATION_LEVEL_MEDIUM_FB — Medium foveation (medium periphery visual fidelity, medium performance)
- XR_FOVEATION_LEVEL_HIGH_FB — High foveation (lower periphery visual fidelity, higher performance)

The possible foveation levels are specified by the XrFoveationDynamicFB enumeration:

```
// Provided by XR_FB_foveation_configuration
typedef enum XrFoveationDynamicFB {
    XR_FOVEATION_DYNAMIC_DISABLED_FB = 0,
    XR_FOVEATION_DYNAMIC_LEVEL_ENABLED_FB = 1,
    XR_FOVEATION_DYNAMIC_MAX_ENUM_FB = 0x7FFFFFFF
} XrFoveationDynamicFB;
```

Enumerant Descriptions

- XR_FOVEATION_DYNAMIC_DISABLED_FB — Static foveation at the maximum desired level
- XR_FOVEATION_DYNAMIC_LEVEL_ENABLED_FB — Dynamic changing foveation based on performance headroom available up to the maximum desired level

New Structures

XrFoveationLevelProfileCreateInfoFB **can** be provided in the `next` chain of XrFoveationProfileCreateInfoFB when calling xrCreateFoveationProfileFB. The runtime **must** interpret XrSwapchainCreateInfoFoveationFB with XrFoveationLevelProfileCreateInfoFB in its `next` chain as a request to create a foveation profile that will apply a fixed foveation pattern according to the

parameters defined in the XrFoveationLevelProfileCreateInfoFB.

The XrFoveationLevelProfileCreateInfoFB structure is defined as:

```
// Provided by XR_FB_foveation_configuration
typedef struct XrFoveationLevelProfileCreateInfoFB {
    XrStructureType         type;
    void*                   next;
    XrFoveationLevelFB      level;
    float                   verticalOffset;
    XrFoveationDynamicFB    dynamic;
} XrFoveationLevelProfileCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `level` is the maximum desired foveation level.
- `verticalOffset` is the desired vertical offset in degrees for the center of the foveation pattern.
- `dynamic` is the desired dynamic foveation setting.

Valid Usage (Implicit)

- The `XR_FB_foveation_configuration` extension **must** be enabled prior to using XrFoveationLevelProfileCreateInfoFB
- `type` **must** be `XR_TYPE_FOVEATION_LEVEL_PROFILE_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrFoveationEyeTrackedProfileCreateInfoMETA
- `level` **must** be a valid XrFoveationLevelFB value
- `dynamic` **must** be a valid XrFoveationDynamicFB value

Overview

The Vulkan graphics API requires an image to be applied to the swapchain to apply a foveation pattern.

This extension allows:

- An application to obtain foveation textures or constructs needed for foveated rendering in Vulkan.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SWAPCHAIN_IMAGE_FOVEATION_VULKAN_FB

New Enums

New Structures

XrSwapchainImageFoveationVulkanFB **can** be provided in the next chain of XrSwapchainImageVulkanKHR when calling xrEnumerateSwapchainImages on a swapchain created with xrCreateSwapchain, if XrSwapchainCreateInfoFoveationFB was in the next chain of XrSwapchainCreateInfo and XrSwapchainCreateInfoFoveationFB had the XR_SWAPCHAIN_CREATE_FOVEATION_FRAGMENT_DENSITY_MAP_BIT_FB flag set. The image, width, and height will be populated by xrEnumerateSwapchainImages to be compatible with the corresponding XrSwapchainImageVulkanKHR.

The XrSwapchainImageFoveationVulkanFB structure is defined as:

```
// Provided by XR_FB_foveation_vulkan
typedef struct XrSwapchainImageFoveationVulkanFB {
    XrStructureType    type;
    void*              next;
    VkImage            image;
    uint32_t           width;
    uint32_t           height;
} XrSwapchainImageFoveationVulkanFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- image is a valid Vulkan VkImage to use.
- width is the horizontal width in pixels of the image.
- height is the vertical height in pixels of the image.

Valid Usage (Implicit)

- The `XR_FB_foveation_vulkan` extension **must** be enabled prior to using XrSwapchainImageFoveationVulkanFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_IMAGE_FOVEATION_VULKAN_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

The XR_EXT_hand_tracking extension provides a list of hand joint poses which represent the current configuration of the tracked hands. This extension adds a layer of gesture recognition that is used by the system.

This extension allows:

- An application to get a set of basic gesture states for the hand when using the XR_EXT_hand_tracking extension.

New Object Types

New Flag Types

```
// Provided by XR_FB_hand_tracking_aim
typedef XrFlags64 XrHandTrackingAimFlagsFB;
```

```
// Provided by XR_FB_hand_tracking_aim
// Flag bits for XrHandTrackingAimFlagsFB
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_COMPUTED_BIT_FB = 0x00000001;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_VALID_BIT_FB = 0x00000002;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_INDEX_PINCHING_BIT_FB =
0x00000004;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_MIDDLE_PINCHING_BIT_FB =
0x00000008;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_RING_PINCHING_BIT_FB =
0x00000010;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_LITTLE_PINCHING_BIT_FB =
0x00000020;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_SYSTEM_GESTURE_BIT_FB =
0x00000040;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_DOMINANT_HAND_BIT_FB =
0x00000080;
static const XrHandTrackingAimFlagsFB XR_HAND_TRACKING_AIM_MENU_PRESSED_BIT_FB =
0x00000100;
```

Flag Descriptions

- XR_HAND_TRACKING_AIM_COMPUTED_BIT_FB — Aiming data is computed from additional sources beyond the hand data in the base structure
- XR_HAND_TRACKING_AIM_VALID_BIT_FB — Aiming data is valid
- XR_HAND_TRACKING_AIM_INDEX_PINCHING_BIT_FB — Index finger pinch discrete signal
- XR_HAND_TRACKING_AIM_MIDDLE_PINCHING_BIT_FB — Middle finger pinch discrete signal
- XR_HAND_TRACKING_AIM_RING_PINCHING_BIT_FB — Ring finger pinch discrete signal
- XR_HAND_TRACKING_AIM_LITTLE_PINCHING_BIT_FB — Little finger pinch discrete signal
- XR_HAND_TRACKING_AIM_SYSTEM_GESTURE_BIT_FB — System gesture is active
- XR_HAND_TRACKING_AIM_DOMINANT_HAND_BIT_FB — Hand is currently marked as dominant for the system
- XR_HAND_TRACKING_AIM_MENU_PRESSED_BIT_FB — System menu gesture is active

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_HAND_TRACKING_AIM_STATE_FB

New Enums

New Structures

XrHandTrackingAimStateFB **can** be provided in the `next` chain of XrHandJointLocationsEXT when calling xrLocateHandJointsEXT to request aiming gesture information associated with this hand.

The XrHandTrackingAimStateFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_aim
typedef struct XrHandTrackingAimStateFB {
    XrStructureType             type;
    void*                       next;
    XrHandTrackingAimFlagsFB    status;
    XrPosef                     aimPose;
    float                       pinchStrengthIndex;
    float                       pinchStrengthMiddle;
    float                       pinchStrengthRing;
    float                       pinchStrengthLittle;
} XrHandTrackingAimStateFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `status` is a bitmask of XrHandTrackingAimFlagBitsFB describing the availability and state of other signals.
- `aimPose` is a system-determined "aim" pose, similar in intent and convention to the aim poses used with the action system, based on hand data.
- `pinchStrengthIndex` is the current pinching strength for the index finger of this hand. Range is 0.0 to 1.0, with 1.0 meaning index and thumb are fully touching.
- `pinchStrengthMiddle` is the current pinching strength for the middle finger of this hand. Range is 0.0 to 1.0, with 1.0 meaning middle and thumb are fully touching.
- `pinchStrengthRing` is the current pinching strength for the ring finger of this hand. Range is 0.0 to 1.0, with 1.0 meaning ring and thumb are fully touching.
- `pinchStrengthLittle` is the current pinching strength for the little finger of this hand. Range is 0.0 to 1.0, with 1.0 meaning little and thumb are fully touching.

Valid Usage (Implicit)

- The `XR_FB_hand_tracking_aim` extension **must** be enabled prior to using XrHandTrackingAimStateFB
- `type` **must** be `XR_TYPE_HAND_TRACKING_AIM_STATE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

The XR_EXT_hand_tracking extension provides a list of hand joint poses which include a collision sphere for each joint. However some physics systems prefer to use capsules as a collision stand in for the hands.

This extension allows:

- An application to get a list of capsules that represent the volume of the hand when using the XR_EXT_hand_tracking extension.

New Object Types

New Flag Types

New Enum Constants

- XR_HAND_TRACKING_CAPSULE_POINT_COUNT_FB
  - XR_FB_HAND_TRACKING_CAPSULE_POINT_COUNT was the original name, and is still provided as an alias

for backward compatibility.

- XR_HAND_TRACKING_CAPSULE_COUNT_FB
  - XR_FB_HAND_TRACKING_CAPSULE_COUNT was the original name, and is still provided as an alias for backward compatibility.

XrStructureType enumeration is extended with:

- XR_TYPE_HAND_TRACKING_CAPSULES_STATE_FB

New Enums

New Structures

The XrHandCapsuleFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_capsules
typedef struct XrHandCapsuleFB {
    XrVector3f        points[XR_HAND_TRACKING_CAPSULE_POINT_COUNT_FB];
    float             radius;
    XrHandJointEXT    joint;
} XrHandCapsuleFB;
```

It describes a collision capsule associated with a hand joint.

Member Descriptions

- points are the two points defining the capsule length.
- radius is the radius of the capsule.
- joint is the hand joint that drives this capsule's transform. Multiple capsules **may** be attached to the same joint.

Valid Usage (Implicit)

- The XR_FB_hand_tracking_capsules extension **must** be enabled prior to using XrHandCapsuleFB

XrHandTrackingCapsulesStateFB **can** be provided in the next chain of XrHandJointLocationsEXT when calling xrLocateHandJointsEXT to request collision capsule information associated with this hand.

The XrHandTrackingCapsulesStateFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_capsules
typedef struct XrHandTrackingCapsulesStateFB {
    XrStructureType    type;
    void*              next;
    XrHandCapsuleFB    capsules[XR_HAND_TRACKING_CAPSULE_COUNT_FB];
} XrHandTrackingCapsulesStateFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `capsules` is an array of capsules.

Valid Usage (Implicit)

- The `XR_FB_hand_tracking_capsules` extension **must** be enabled prior to using XrHandTrackingCapsulesStateFB
- `type` **must** be `XR_TYPE_HAND_TRACKING_CAPSULES_STATE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

Issues

Version History

- Revision 1, 2021-07-07 (Federico Schliemann)
  - Initial extension description
- Revision 2, 2021-11-18 (Rylie Pavlik, Collabora, Ltd.)
  - Fix typos/naming convention errors: rename `XR_FB_HAND_TRACKING_CAPSULE_POINT_COUNT` to `XR_HAND_TRACKING_CAPSULE_POINT_COUNT_FB` and `XR_FB_HAND_TRACKING_CAPSULE_COUNT` to `XR_HAND_TRACKING_CAPSULE_COUNT_FB`, providing the old names as compatibility aliases.
- Revision 3, 2022-04-20 (John Kearney)
  - Correct next chain parent for `XrHandTrackingCapsulesStateFB` to `XrHandJointLocationsEXT`

Overview

The XR_EXT_hand_tracking extension provides a list of hand joint poses but no mechanism to render a skinned hand mesh.

This extension allows:

- An application to get a skinned hand mesh and a bind pose skeleton that **can** be used to render a hand object driven by the joints from the XR_EXT_hand_tracking extension.
- Control the scale of the hand joints returned by XR_EXT_hand_tracking.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_HAND_TRACKING_MESH_FB
- XR_TYPE_HAND_TRACKING_SCALE_FB

New Enums

New Structures

The XrVector4sFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_mesh
typedef struct XrVector4sFB {
    int16_t    x;
    int16_t    y;
    int16_t    z;
    int16_t    w;
} XrVector4sFB;
```

This is a short integer, four component vector type, used for per-vertex joint indexing for mesh skinning.

Member Descriptions

- x is the x component of the vector.
- y is the y component of the vector.
- z is the z component of the vector.
- w is the w component of the vector.

Valid Usage (Implicit)

- The XR_FB_hand_tracking_mesh extension **must** be enabled prior to using XrVector4sFB

The XrHandTrackingMeshFB structure contains three sets of parallel, application-allocated arrays: one with per-joint data, one with vertex data, and one with index data.

The XrHandTrackingMeshFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_mesh
typedef struct XrHandTrackingMeshFB {
    XrStructureType    type;
    void*              next;
    uint32_t           jointCapacityInput;
    uint32_t           jointCountOutput;
    XrPosef*           jointBindPoses;
    float*             jointRadii;
    XrHandJointEXT*    jointParents;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector3f*        vertexPositions;
    XrVector3f*        vertexNormals;
    XrVector2f*        vertexUVs;
    XrVector4sFB*      vertexBlendIndices;
    XrVector4f*        vertexBlendWeights;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    int16_t*           indices;
} XrHandTrackingMeshFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `jointCapacityInput` is the capacity of the joint data arrays in this structure, or `0` to indicate a request to retrieve the required capacity.
- `jointCountOutput` is filled in by the runtime with the count of joint data elements written, or the required capacity in the case that any of `jointCapacityInput`, `vertexCapacityInput`, or `indexCapacityInput` is insufficient.
- `jointBindPoses` is an array of poses that matches what is returned by xrLocateHandJointsEXT which describes the hand skeleton's bind pose.
- `jointRadii` is an array of joint radii at bind pose.
- `jointParents` is an array of joint parents to define a bone hierarchy for the hand skeleton.
- `vertexCapacityInput` is the capacity of the vertex data arrays in this structure, or `0` to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is filled in by the runtime with the count of vertex data elements written, or the required capacity in the case that any of `jointCapacityInput`, `vertexCapacityInput`, or `indexCapacityInput` is insufficient.
- `vertexPositions` is an array of 3D vertex positions.
- `vertexNormals` is an array of 3D vertex normals.
- `vertexUVs` is an array of texture coordinates for this vertex.
- `vertexBlendIndices` is an array of bone blend indices.
- `vertexBlendWeights` is an array of bone blend weights.
- `indexCapacityInput` is the capacity of the index data arrays in this structure, or `0` to indicate a request to retrieve the required capacity.
- `indexCountOutput` is filled in by the runtime with the count of index data elements written, or the required capacity in the case that any of `jointCapacityInput`, `vertexCapacityInput`, or `indexCapacityInput` is insufficient.
- `indices` is an array of triangle indices.
- See the Buffer Size Parameters section for a detailed description of retrieving the array sizes in the "struct form" as used here.

All arrays are application-allocated, and all **may** be `NULL` if any of `jointCapacityInput`, `vertexCapacityInput`, or `indexCapacityInput` is `0`.

The data in a fully-populated XrHandTrackingMeshFB is immutable during the lifetime of the

corresponding XrInstance, and is intended to be retrieved once then used in combination with data changing per-frame retrieved from xrLocateHandJointsEXT.

Valid Usage (Implicit)

- The XR_FB_hand_tracking_mesh extension **must** be enabled prior to using XrHandTrackingMeshFB
- type **must** be XR_TYPE_HAND_TRACKING_MESH_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If jointCapacityInput is not 0, jointBindPoses **must** be a pointer to an array of jointCapacityInput XrPosef structures
- If jointCapacityInput is not 0, jointRadii **must** be a pointer to an array of jointCapacityInput float values
- If jointCapacityInput is not 0, jointParents **must** be a pointer to an array of jointCapacityInput XrHandJointEXT values
- If vertexCapacityInput is not 0, vertexPositions **must** be a pointer to an array of vertexCapacityInput XrVector3f structures
- If vertexCapacityInput is not 0, vertexNormals **must** be a pointer to an array of vertexCapacityInput XrVector3f structures
- If vertexCapacityInput is not 0, vertexUVs **must** be a pointer to an array of vertexCapacityInput XrVector2f structures
- If vertexCapacityInput is not 0, vertexBlendIndices **must** be a pointer to an array of vertexCapacityInput XrVector4sFB structures
- If vertexCapacityInput is not 0, vertexBlendWeights **must** be a pointer to an array of vertexCapacityInput XrVector4f structures
- If indexCapacityInput is not 0, indices **must** be a pointer to an array of indexCapacityInput int16_t values

XrHandTrackingScaleFB **can** be provided in the next chain of XrHandJointLocationsEXT when calling xrLocateHandJointsEXT to indicate to the runtime that the requested joints need to be scaled to a different size and to query the existing scale value. This is useful in breaking up the overall scale out of the skinning transforms.

The XrHandTrackingScaleFB structure is defined as:

```
// Provided by XR_FB_hand_tracking_mesh
typedef struct XrHandTrackingScaleFB {
    XrStructureType    type;
    void*              next;
    float              sensorOutput;
    float              currentOutput;
    XrBool32           overrideHandScale;
    float              overrideValueInput;
} XrHandTrackingScaleFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `sensorOutput` is an output value: the currently measured scale as otherwise applied without passing this structure.
- `currentOutput` is an output value: the effective output that the bind skeleton is getting on the current call, which **may** be subject to filtering, scaling, or validation.
- `overrideHandScale` indicates whether the runtime **must** scale the output of this xrLocateHandJointsEXT call according to `overrideValueInput`
- `overrideValueInput` is an **optional** input value, enabled only when the `overrideHandScale` parameter is set. Setting this to 1.0 and setting `overrideHandScale` to `true` will give the joints in mesh binding scale.

Valid Usage (Implicit)

- The `XR_FB_hand_tracking_mesh` extension **must** be enabled prior to using XrHandTrackingScaleFB
- `type` **must** be `XR_TYPE_HAND_TRACKING_SCALE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrGetHandMeshFB function is defined as:

```
// Provided by XR_FB_hand_tracking_mesh
XrResult xrGetHandMeshFB(
    XrHandTrackerEXT                            handTracker,
    XrHandTrackingMeshFB*                       mesh);
```

Parameter Descriptions

- `handTracker` is the XrHandTrackerEXT that is associated with a particular hand.
- `mesh` is the XrHandTrackingMeshFB output structure.

The xrGetHandMeshFB function populates an XrHandTrackingMeshFB structure with enough information to render a skinned mesh driven by the hand joints. As discussed in the specification for that structure, the data enumerated by this call is constant during the lifetime of an XrInstance.

Valid Usage (Implicit)

- The `XR_FB_hand_tracking_mesh` extension **must** be enabled prior to calling xrGetHandMeshFB
- `handTracker` **must** be a valid XrHandTrackerEXT handle
- `mesh` **must** be a pointer to an XrHandTrackingMeshFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`

12.113.1. Overview

This extension enables applications to trigger haptic effect using an Amplitude Envelope buffer.

Trigger haptics

An application can trigger an amplitude envelope haptic effect by creating a XrHapticAmplitudeEnvelopeVibrationFB structure and calling xrApplyHapticFeedback.

The XrHapticAmplitudeEnvelopeVibrationFB structure is defined as:

```
// Provided by XR_FB_haptic_amplitude_envelope
typedef struct XrHapticAmplitudeEnvelopeVibrationFB {
    XrStructureType    type;
    const void*        next;
    XrDuration         duration;
    uint32_t           amplitudeCount;
    const float*       amplitudes;
} XrHapticAmplitudeEnvelopeVibrationFB;
```

This structure describes an amplitude envelope haptic effect.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `duration` is the duration of the haptic effect in nanoseconds. See Duration for more details.
- `amplitudeCount` is the number of samples in the buffer.
- `amplitudes` is the pointer to a float array that contains the samples.

The runtime **should** resample the provided samples in the `amplitudes`, and maintain an internal buffer which **should** be of XR_MAX_HAPTIC_AMPLITUDE_ENVELOPE_SAMPLES_FB length. The resampling **should** happen based on the `duration`, `amplitudeCount`, and the device's sample rate.

Valid Usage (Implicit)

- The `XR_FB_haptic_amplitude_envelope` extension **must** be enabled prior to using XrHapticAmplitudeEnvelopeVibrationFB
- `type` **must** be `XR_TYPE_HAPTIC_AMPLITUDE_ENVELOPE_VIBRATION_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `amplitudes` **must** be a pointer to an array of `amplitudeCount` `float` values
- The `amplitudeCount` parameter **must** be greater than `0`

New Object Types

New Flag Types

New Enum Constants

- `XR_TYPE_HAPTIC_AMPLITUDE_ENVELOPE_VIBRATION_FB`

New Defines

```
// Provided by XR_FB_haptic_amplitude_envelope
#define XR_MAX_HAPTIC_AMPLITUDE_ENVELOPE_SAMPLES_FB 4000u
```

XR_MAX_HAPTIC_AMPLITUDE_ENVELOPE_SAMPLES_FB defines the maximum number of sample the runtime **should** store in memory.

12.114.1. Overview

This extension enables applications to trigger haptic effects using Pulse Code Modulation (PCM) buffers.

Trigger haptics

An application **can** trigger PCM haptic effect by creating a XrHapticPcmVibrationFB structure and calling xrApplyHapticFeedback.

The XrHapticPcmVibrationFB structure is defined as:

```
// Provided by XR_FB_haptic_pcm
typedef struct XrHapticPcmVibrationFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           bufferSize;
    const float*       buffer;
    float              sampleRate;
    XrBool32           append;
    uint32_t*          samplesConsumed;
} XrHapticPcmVibrationFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `bufferSize` is the number of samples in the buffer.
- `buffer` is a pointer to a float array representing the PCM samples. If you consider the haptic effect as a sampled analog audio, then this buffer will contain the samples representing that effect. The values in this buffer are expected to be in the range [-1.0, 1.0].
- `sampleRate` is the number of samples to be played per second, this is used to determine the duration of the haptic effect.
- `append` if set to `XR_FALSE`, any existing samples will be cleared and a new haptic effect will begin, if `XR_TRUE`, samples will be appended to the currently playing effect
- `samplesConsumed` is a pointer to an unsigned integer; it is populated by runtime, to tell the application about how many samples were consumed from the input `buffer`

This structure describes a PCM haptic effect.

The runtime **may** resample the provided samples in the `buffer`, and maintain an internal buffer which **should** be of XR_MAX_HAPTIC_PCM_BUFFER_SIZE_FB length. The resampling **should** happen based on the `sampleRate` and the device's sample rate.

If `append` is `XR_TRUE` and a preceding XrHapticPcmVibrationFB haptic effect on this action has not yet completed, then the runtime **must** finish playing the preceding samples and then play the new haptic effect. If a preceding haptic event on this action has not yet completed, and either the preceding effect is not an XrHapticPcmVibrationFB haptic effect or `append` is `XR_FALSE`, the runtime **must** cancel the preceding incomplete effects on that action and start playing the new haptic effect, as usual for the core specification.

When `append` is true and a preceding XrHapticPcmVibrationFB haptic effect on this action has not yet

completed, then the application can provide a different sampleRate in the new haptic effect.

The runtime **must** populate the samplesConsumed with the count of the samples from buffer which were consumed. The samplesConsumed is populated before the xrApplyHapticFeedback returns.

Valid Usage (Implicit)

- The XR_FB_haptic_pcm extension **must** be enabled prior to using XrHapticPcmVibrationFB
- type **must** be XR_TYPE_HAPTIC_PCM_VIBRATION_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- buffer **must** be a pointer to an array of bufferSize float values
- samplesConsumed **must** be a pointer to a uint32_t value
- The bufferSize parameter **must** be greater than 0

Get the device sample rate

An application **can** use the xrGetDeviceSampleRateFB function to get the sample rate of the currently bound device on which the haptic action is triggered. If the application does not want any resampling to occur, then it can use this function to know the currently bound device sample rate, and pass that value in sampleRate of XrHapticPcmVibrationFB.

```
// Provided by XR_FB_haptic_pcm
XrResult xrGetDeviceSampleRateFB(
    XrSession                                   session,
    const XrHapticActionInfo*                   hapticActionInfo,
    XrDevicePcmSampleRateGetInfoFB*             deviceSampleRate);
```

Parameter Descriptions

- session is the specified XrSession.
- hapticActionInfo is the XrHapticActionInfo used to provide action and subaction paths
- deviceSampleRate is a pointer to XrDevicePcmSampleRateStateFB which is populated by the runtime.

The runtime **must** use the hapticActionInfo to get the sample rate of the currently bound device on which haptics is triggered and populate the deviceSampleRate structure. The device is determined by the XrHapticActionInfo::action and XrHapticActionInfo::subactionPath. If the hapticActionInfo is bound to more than one device, then runtime **should** assume that the all these bound devices have the same deviceSampleRate and the runtime **should** return the sampleRate for any of those bound devices. If the device is invalid, the runtime **must** populate the deviceSampleRate of XrDevicePcmSampleRateStateFB

as 0. A device can be invalid if the runtime does not find any device (which can play haptics) connected to the headset, or if the device does not support PCM haptic effect.

Valid Usage (Implicit)

- The XR_FB_haptic_pcm extension **must** be enabled prior to calling xrGetDeviceSampleRateFB
- session **must** be a valid XrSession handle
- hapticActionInfo **must** be a pointer to a valid XrHapticActionInfo structure
- deviceSampleRate **must** be a pointer to an XrDevicePcmSampleRateGetInfoFB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_ACTIONSET_NOT_ATTACHED
- XR_ERROR_ACTION_TYPE_MISMATCH
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_PATH_INVALID
- XR_ERROR_PATH_UNSUPPORTED
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrDevicePcmSampleRateStateFB structure is defined as:

```
// Provided by XR_FB_haptic_pcm
typedef struct XrDevicePcmSampleRateStateFB {
    XrStructureType    type;
    void*              next;
    float              sampleRate;
} XrDevicePcmSampleRateStateFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `sampleRate` is the sample rate of the currently bound device which can play a haptic effect

Valid Usage (Implicit)

- The `XR_FB_haptic_pcm` extension **must** be enabled prior to using XrDevicePcmSampleRateStateFB
- `type` **must** be `XR_TYPE_DEVICE_PCM_SAMPLE_RATE_STATE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_HAPTIC_PCM_VIBRATION_FB`
- `XR_TYPE_DEVICE_PCM_SAMPLE_RATE_STATE_FB`

New Defines

```
// Provided by XR_FB_haptic_pcm
#define XR_MAX_HAPTIC_PCM_BUFFER_SIZE_FB 4000
```

XR_MAX_HAPTIC_PCM_BUFFER_SIZE_FB defines the maximum number of samples the runtime can store.

Overview

This extension allows the application to query the system for a supported trackable keyboard type and obtain an XrSpace handle to track it. It also provides relevant metadata about the keyboard itself, including bounds and a human readable identifier.

New Object Types

New Flag Types

```
// Provided by XR_FB_keyboard_tracking
typedef XrFlags64 XrKeyboardTrackingFlagsFB;
```

```
// Provided by XR_FB_keyboard_tracking
// Flag bits for XrKeyboardTrackingFlagsFB
static const XrKeyboardTrackingFlagsFB XR_KEYBOARD_TRACKING_EXISTS_BIT_FB = 0x00000001;
static const XrKeyboardTrackingFlagsFB XR_KEYBOARD_TRACKING_LOCAL_BIT_FB = 0x00000002;
static const XrKeyboardTrackingFlagsFB XR_KEYBOARD_TRACKING_REMOTE_BIT_FB = 0x00000004;
static const XrKeyboardTrackingFlagsFB XR_KEYBOARD_TRACKING_CONNECTED_BIT_FB =
0x00000008;
```

Flag Descriptions

- XR_KEYBOARD_TRACKING_EXISTS_BIT_FB — indicates that the system has a physically tracked keyboard to report. If not set then no other bits should be considered to be valid or meaningful. If set either XR_KEYBOARD_TRACKING_LOCAL_BIT_FB or XR_KEYBOARD_TRACKING_REMOTE_BIT_FB must also be set.
- XR_KEYBOARD_TRACKING_LOCAL_BIT_FB — indicates that the physically tracked keyboard is intended to be used in a local pairing with the system. Mutually exclusive with XR_KEYBOARD_TRACKING_REMOTE_BIT_FB.
- XR_KEYBOARD_TRACKING_REMOTE_BIT_FB — indicates that the physically tracked keyboard is intended to be used while paired to a separate remote computing device. Mutually exclusive with XR_KEYBOARD_TRACKING_LOCAL_BIT_FB.
- XR_KEYBOARD_TRACKING_CONNECTED_BIT_FB — indicates that the physically tracked keyboard is actively connected to the headset and capable of sending key data

```
// Provided by XR_FB_keyboard_tracking
typedef XrFlags64 XrKeyboardTrackingQueryFlagsFB;
```

```
// Provided by XR_FB_keyboard_tracking
// Flag bits for XrKeyboardTrackingQueryFlagsFB
static const XrKeyboardTrackingQueryFlagsFB XR_KEYBOARD_TRACKING_QUERY_LOCAL_BIT_FB =
0x00000002;
static const XrKeyboardTrackingQueryFlagsFB XR_KEYBOARD_TRACKING_QUERY_REMOTE_BIT_FB =
0x00000004;
```

Flag Descriptions

- XR_KEYBOARD_TRACKING_QUERY_LOCAL_BIT_FB — indicates the query is for the physically tracked keyboard that is intended to be used in a local pairing with the System. Mutually exclusive with XR_KEYBOARD_TRACKING_QUERY_REMOTE_BIT_FB.
- XR_KEYBOARD_TRACKING_QUERY_REMOTE_BIT_FB — indicates the query is for the physically tracked keyboard that may be connected to a separate remote computing device. Mutually exclusive with XR_KEYBOARD_TRACKING_QUERY_LOCAL_BIT_FB.

New Enum Constants

- XR_MAX_KEYBOARD_TRACKING_NAME_SIZE_FB

XrStructureType enumeration is extended with:

- XR_TYPE_KEYBOARD_SPACE_CREATE_INFO_FB
- XR_TYPE_KEYBOARD_TRACKING_QUERY_FB
- XR_TYPE_SYSTEM_KEYBOARD_TRACKING_PROPERTIES_FB

New Enums

New Structures

The XrSystemKeyboardTrackingPropertiesFB structure is defined as:

```
// Provided by XR_FB_keyboard_tracking
typedef struct XrSystemKeyboardTrackingPropertiesFB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsKeyboardTracking;
} XrSystemKeyboardTrackingPropertiesFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- supportsKeyboardTracking defines whether the system supports the tracked keyboard feature.

XrSystemKeyboardTrackingPropertiesFB is populated with information from the system about tracked keyboard support.

Valid Usage (Implicit)

- The XR_FB_keyboard_tracking extension **must** be enabled prior to using XrSystemKeyboardTrackingPropertiesFB
- type **must** be XR_TYPE_SYSTEM_KEYBOARD_TRACKING_PROPERTIES_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrKeyboardTrackingQueryFB structure is defined as:

```
// Provided by XR_FB_keyboard_tracking
typedef struct XrKeyboardTrackingQueryFB {
    XrStructureType                   type;
    void*                             next;
    XrKeyboardTrackingQueryFlagsFB    flags;
} XrKeyboardTrackingQueryFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- flags is a bitmask of XrKeyboardTrackingQueryFlagsFB.

XrKeyboardTrackingQueryFB specifies input data needed to determine which type of tracked keyboard to query for.

Valid Usage (Implicit)

- The XR_FB_keyboard_tracking extension **must** be enabled prior to using XrKeyboardTrackingQueryFB
- type **must** be XR_TYPE_KEYBOARD_TRACKING_QUERY_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- flags **must** be a valid combination of XrKeyboardTrackingQueryFlagBitsFB values
- flags **must** not be 0

The XrKeyboardTrackingDescriptionFB structure is defined as:

```
// Provided by XR_FB_keyboard_tracking
typedef struct XrKeyboardTrackingDescriptionFB {
    uint64_t                    trackedKeyboardId;
    XrVector3f                  size;
    XrKeyboardTrackingFlagsFB   flags;
    char                        name[XR_MAX_KEYBOARD_TRACKING_NAME_SIZE_FB];
} XrKeyboardTrackingDescriptionFB;
```

Member Descriptions

- `trackedKeyboardId` abstract identifier describing the type of keyboard.
- `size` bounding box.
- `flags` additional information on the type of keyboard available. If `XR_KEYBOARD_TRACKING_EXISTS_BIT_FB` is not set there is no keyboard.
- `name` human readable keyboard identifier.

XrKeyboardTrackingDescriptionFB describes a trackable keyboard and its associated metadata.

Valid Usage (Implicit)

- The `XR_FB_keyboard_tracking` extension **must** be enabled prior to using XrKeyboardTrackingDescriptionFB

The XrKeyboardSpaceCreateInfoFB structure is defined as:

```
// Provided by XR_FB_keyboard_tracking
typedef struct XrKeyboardSpaceCreateInfoFB {
    XrStructureType    type;
    void*              next;
    uint64_t           trackedKeyboardId;
} XrKeyboardSpaceCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `trackedKeyboardId` abstract identifier describing the type of keyboard to track.

XrKeyboardSpaceCreateInfoFB describes a request for the system needed to create a trackable XrSpace associated with the keyboard.

Valid Usage (Implicit)

- The XR_FB_keyboard_tracking extension **must** be enabled prior to using XrKeyboardSpaceCreateInfoFB
- type **must** be XR_TYPE_KEYBOARD_SPACE_CREATE_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

New Functions

The xrQuerySystemTrackedKeyboardFB function is defined as:

```
// Provided by XR_FB_keyboard_tracking
XrResult xrQuerySystemTrackedKeyboardFB(
    XrSession                                   session,
    const XrKeyboardTrackingQueryFB*            queryInfo,
    XrKeyboardTrackingDescriptionFB*            keyboard);
```

Parameter Descriptions

- session is the session that will be associated with a keyboard space.
- queryInfo is the XrKeyboardTrackingQueryFB that describes the type of keyboard to return. queryInfo must have either XR_KEYBOARD_TRACKING_QUERY_LOCAL_BIT_FB or XR_KEYBOARD_TRACKING_QUERY_REMOTE_BIT_FB set.
- keyboard is the XrKeyboardTrackingDescriptionFB output structure.

The xrQuerySystemTrackedKeyboardFB function populates an XrKeyboardTrackingDescriptionFB structure with enough information to describe a keyboard that the system can locate.

Valid Usage (Implicit)

- The XR_FB_keyboard_tracking extension **must** be enabled prior to calling xrQuerySystemTrackedKeyboardFB
- session **must** be a valid XrSession handle
- queryInfo **must** be a pointer to a valid XrKeyboardTrackingQueryFB structure
- keyboard **must** be a pointer to an XrKeyboardTrackingDescriptionFB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrCreateKeyboardSpaceFB function is defined as:

```
// Provided by XR_FB_keyboard_tracking
XrResult xrCreateKeyboardSpaceFB(
    XrSession                                   session,
    const XrKeyboardSpaceCreateInfoFB*          createInfo,
    XrSpace*                                    keyboardSpace);
```

Parameter Descriptions

- session is the session that will be associated with the returned keyboard space.
- createInfo is the XrKeyboardSpaceCreateInfoFB that describes the type of keyboard to track.
- keyboardSpace is the XrSpace output structure.

The xrCreateKeyboardSpaceFB function returns an XrSpace that can be used to locate a physical keyboard in space. The origin of the created XrSpace is located in the center of the bounding box in the x and z axes, and at the top of the y axis (meaning the keyboard is located entirely in negative y).

Valid Usage (Implicit)

- The XR_FB_keyboard_tracking extension **must** be enabled prior to calling xrCreateKeyboardSpaceFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrKeyboardSpaceCreateInfoFB structure
- keyboardSpace **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

Overview

Passthrough is a way to show a user their physical environment in a light-blocking VR headset. Applications may use passthrough in a multitude of ways, including:

- Creating AR-like experiences, where virtual objects augment the user's environment.
- Bringing real objects into a VR experience.
- Mapping the playspace such that a VR experience is customized to it.

This extension allows:

- An application to request passthrough to be composited with the application content.
- An application to specify the compositing and blending rules between passthrough and VR content.
- An application to apply styles, such as color mapping and edge rendering, to passthrough.
- An application to provide a geometry to be used in place of the user's physical environment. Camera images will be projected onto the surface provided by the application. In some cases where a part of the environment, such as a desk, can be approximated well, this provides better visual experience.

New Object Types

```
// Provided by XR_FB_passthrough
XR_DEFINE_HANDLE(XrPassthroughFB)
```

XrPassthroughFB represents a passthrough feature.

```
// Provided by XR_FB_passthrough
XR_DEFINE_HANDLE(XrPassthroughLayerFB)
```

XrPassthroughLayerFB represents a layer of passthrough content.

```
// Provided by XR_FB_passthrough
XR_DEFINE_HANDLE(XrGeometryInstanceFB)
```

XrGeometryInstanceFB represents a geometry instance used in a passthrough layer.

New Flag Types

```
// Provided by XR_FB_passthrough
typedef XrFlags64 XrPassthroughFlagsFB;
```

Specify additional creation behavior.

```
// Provided by XR_FB_passthrough
// Flag bits for XrPassthroughFlagsFB
static const XrPassthroughFlagsFB XR_PASSTHROUGH_IS_RUNNING_AT_CREATION_BIT_FB =
0x00000001;
static const XrPassthroughFlagsFB XR_PASSTHROUGH_LAYER_DEPTH_BIT_FB = 0x00000002;
```

Flag Descriptions

- XR_PASSTHROUGH_IS_RUNNING_AT_CREATION_BIT_FB — The object (passthrough, layer) is running at creation.
- XR_PASSTHROUGH_LAYER_DEPTH_BIT_FB — The passthrough system sends depth information to the compositor. Only applicable to layer objects.

```
// Provided by XR_FB_passthrough
typedef XrFlags64 XrPassthroughStateChangedFlagsFB;
```

Specify additional state change behavior.

```
// Provided by XR_FB_passthrough
// Flag bits for XrPassthroughStateChangedFlagsFB
static const XrPassthroughStateChangedFlagsFB
XR_PASSTHROUGH_STATE_CHANGED_REINIT_REQUIRED_BIT_FB = 0x00000001;
static const XrPassthroughStateChangedFlagsFB
XR_PASSTHROUGH_STATE_CHANGED_NON_RECOVERABLE_ERROR_BIT_FB = 0x00000002;
static const XrPassthroughStateChangedFlagsFB
XR_PASSTHROUGH_STATE_CHANGED_RECOVERABLE_ERROR_BIT_FB = 0x00000004;
static const XrPassthroughStateChangedFlagsFB
XR_PASSTHROUGH_STATE_CHANGED_RESTORED_ERROR_BIT_FB = 0x00000008;
```

Flag Descriptions

- XR_PASSTHROUGH_STATE_CHANGED_REINIT_REQUIRED_BIT_FB — Passthrough system requires reinitialization.
- XR_PASSTHROUGH_STATE_CHANGED_NON_RECOVERABLE_ERROR_BIT_FB — Non-recoverable error has occurred. A device reboot or a firmware update may be required.
- XR_PASSTHROUGH_STATE_CHANGED_RECOVERABLE_ERROR_BIT_FB — A recoverable error has occurred. The runtime will attempt to recover, but some functionality may be temporarily unavailable.
- XR_PASSTHROUGH_STATE_CHANGED_RESTORED_ERROR_BIT_FB — The runtime has recovered from a previous error and is functioning normally.

```
// Provided by XR_FB_passthrough
typedef XrFlags64 XrPassthroughCapabilityFlagsFB;
```

Specify passthrough system capabilities.

```
// Provided by XR_FB_passthrough
// Flag bits for XrPassthroughCapabilityFlagsFB
static const XrPassthroughCapabilityFlagsFB XR_PASSTHROUGH_CAPABILITY_BIT_FB =
0x00000001;
static const XrPassthroughCapabilityFlagsFB XR_PASSTHROUGH_CAPABILITY_COLOR_BIT_FB =
0x00000002;
static const XrPassthroughCapabilityFlagsFB XR_PASSTHROUGH_CAPABILITY_LAYER_DEPTH_BIT_FB
= 0x00000004;
```

Flag Descriptions

- XR_PASSTHROUGH_CAPABILITY_BIT_FB — The system supports passthrough.
- XR_PASSTHROUGH_CAPABILITY_COLOR_BIT_FB — The system can show passthrough with realistic colors. XR_PASSTHROUGH_CAPABILITY_BIT_FB **must** be set if XR_PASSTHROUGH_CAPABILITY_COLOR_BIT_FB is set.
- XR_PASSTHROUGH_CAPABILITY_LAYER_DEPTH_BIT_FB — The system supports passthrough layers composited using depth testing. XR_PASSTHROUGH_CAPABILITY_BIT_FB **must** be set if XR_PASSTHROUGH_CAPABILITY_LAYER_DEPTH_BIT_FB is set.

New Enum Constants

- XR_PASSTHROUGH_COLOR_MAP_MONO_SIZE_FB

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_PASSTHROUGH_PROPERTIES_FB
- XR_TYPE_PASSTHROUGH_CREATE_INFO_FB
- XR_TYPE_PASSTHROUGH_LAYER_CREATE_INFO_FB
- XR_TYPE_COMPOSITION_LAYER_PASSTHROUGH_FB
- XR_TYPE_GEOMETRY_INSTANCE_CREATE_INFO_FB
- XR_TYPE_GEOMETRY_INSTANCE_TRANSFORM_FB
- XR_TYPE_PASSTHROUGH_STYLE_FB
- XR_TYPE_PASSTHROUGH_COLOR_MAP_MONO_TO_RGBA_FB
- XR_TYPE_PASSTHROUGH_COLOR_MAP_MONO_TO_MONO_FB
- XR_TYPE_PASSTHROUGH_BRIGHTNESS_CONTRAST_SATURATION_FB
- XR_TYPE_EVENT_DATA_PASSTHROUGH_STATE_CHANGED_FB

XrResult enumeration is extended with:

- XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB The state of an object for which a function is called is not one of the expected states for that function.
- XR_ERROR_FEATURE_ALREADY_CREATED_PASSTHROUGH_FB An application attempted to create a feature when one has already been created and only one can exist.
- XR_ERROR_FEATURE_REQUIRED_PASSTHROUGH_FB A feature is required before the function can be called.
- XR_ERROR_NOT_PERMITTED_PASSTHROUGH_FB Operation is not permitted.
- XR_ERROR_INSUFFICIENT_RESOURCES_PASSTHROUGH_FB The runtime does not have sufficient resources to perform the operation. Either the object being created is too large, or too many objects of a specific

kind have been created.

New Enums

Specify the kind of passthrough behavior the layer provides.

```
// Provided by XR_FB_passthrough
typedef enum XrPassthroughLayerPurposeFB {
    XR_PASSTHROUGH_LAYER_PURPOSE_RECONSTRUCTION_FB = 0,
    XR_PASSTHROUGH_LAYER_PURPOSE_PROJECTED_FB = 1,
  // Provided by XR_FB_passthrough_keyboard_hands
    XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_HANDS_FB = 1000203001,
  // Provided by XR_FB_passthrough_keyboard_hands
    XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_MASKED_HANDS_FB = 1000203002,
    XR_PASSTHROUGH_LAYER_PURPOSE_MAX_ENUM_FB = 0x7FFFFFFF
} XrPassthroughLayerPurposeFB;
```

Enumerant Descriptions

- XR_PASSTHROUGH_LAYER_PURPOSE_RECONSTRUCTION_FB — Reconstruction passthrough (full screen environment)
- XR_PASSTHROUGH_LAYER_PURPOSE_PROJECTED_FB — Projected passthrough (using a custom surface)
- XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_HANDS_FB — Passthrough layer purpose for keyboard hands presence. (Added by the XR_FB_passthrough_keyboard_hands extension)
- XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_MASKED_HANDS_FB — Passthrough layer purpose for keyboard hands presence with keyboard masked hand transitions (i.e passthrough hands rendered only when they are over the keyboard). (Added by the XR_FB_passthrough_keyboard_hands extension)

New Structures

The XrSystemPassthroughPropertiesFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrSystemPassthroughPropertiesFB {
    XrStructureType    type;
    const void*        next;
    XrBool32           supportsPassthrough;
} XrSystemPassthroughPropertiesFB;
```

It describes a passthrough system property.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsPassthrough` defines whether the system supports the passthrough feature.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrSystemPassthroughPropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_PASSTHROUGH_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Structures

The XrSystemPassthroughProperties2FB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrSystemPassthroughProperties2FB {
    XrStructureType                   type;
    const void*                       next;
    XrPassthroughCapabilityFlagsFB    capabilities;
} XrSystemPassthroughProperties2FB;
```

Applications **can** pass this structure in a call to xrGetSystemProperties to query passthrough system properties. Applications **should** verify that the runtime implements `XR_FB_passthrough` spec version 3 or newer before doing so. In older versions, this structure is not supported and will be left unpopulated. Applications **should** use XrSystemPassthroughPropertiesFB in that case.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `capabilities` defines a set of features supported by the passthrough system.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to using XrSystemPassthroughProperties2FB
- type **must** be XR_TYPE_SYSTEM_PASSTHROUGH_PROPERTIES2_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrPassthroughCreateInfoFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughCreateInfoFB {
    XrStructureType         type;
    const void*             next;
    XrPassthroughFlagsFB    flags;
} XrPassthroughCreateInfoFB;
```

It contains parameters used to specify a new passthrough feature.

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- flags is a bitmask of XrPassthroughFlagBitsFB that specify additional behavior.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to using XrPassthroughCreateInfoFB
- type **must** be XR_TYPE_PASSTHROUGH_CREATE_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- flags **must** be 0 or a valid combination of XrPassthroughFlagBitsFB values

The XrPassthroughLayerCreateInfoFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughLayerCreateInfoFB {
    XrStructureType                type;
    const void*                    next;
    XrPassthroughFB                passthrough;
    XrPassthroughFlagsFB           flags;
    XrPassthroughLayerPurposeFB    purpose;
} XrPassthroughLayerCreateInfoFB;
```

It contains parameters used to specify a new passthrough layer.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `passthrough` an XrPassthroughFB handle.
- `flags` XrPassthroughFlagsFB that specify additional behavior.
- `purpose` XrPassthroughLayerPurposeFB that specifies the layer's purpose.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrPassthroughLayerCreateInfoFB
- `type` **must** be `XR_TYPE_PASSTHROUGH_LAYER_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `passthrough` **must** be a valid XrPassthroughFB handle
- `flags` **must** be `0` or a valid combination of XrPassthroughFlagBitsFB values
- `purpose` **must** be a valid XrPassthroughLayerPurposeFB value

The XrCompositionLayerPassthroughFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrCompositionLayerPassthroughFB {
    XrStructureType            type;
    const void*                next;
    XrCompositionLayerFlags    flags;
    XrSpace                    space;
    XrPassthroughLayerFB       layerHandle;
} XrCompositionLayerPassthroughFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrCompositionLayerFlagBits that specify additional behavior.
- `space` is the XrSpace that specifies the layer's space - **must** be XR_NULL_HANDLE.
- `layerHandle` is the XrPassthroughLayerFB that defines this layer's behavior.

It is a composition layer type that may be submitted in xrEndFrame where an XrCompositionLayerBaseHeader is specified, as a stand-in for the actual passthrough contents.

Errata: the third field of this structure is named `flags` rather than `layerFlags` as expected and as documented for for the parent type XrCompositionLayerBaseHeader.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrCompositionLayerPassthroughFB
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_PASSTHROUGH_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be a valid combination of XrCompositionLayerFlagBits values
- `flags` **must** not be `0`
- If `space` is not XR_NULL_HANDLE, `space` **must** be a valid XrSpace handle
- `layerHandle` **must** be a valid XrPassthroughLayerFB handle
- Both of `layerHandle` and `space` that are valid handles **must** have been created, allocated, or retrieved from the same XrSession

The XrGeometryInstanceCreateInfoFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrGeometryInstanceCreateInfoFB {
    XrStructureType         type;
    const void*             next;
    XrPassthroughLayerFB    layer;
    XrTriangleMeshFB        mesh;
    XrSpace                 baseSpace;
    XrPosef                 pose;
    XrVector3f              scale;
} XrGeometryInstanceCreateInfoFB;
```

It contains parameters to specify a new geometry instance.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `layer` is the XrPassthroughLayerFB.
- `mesh` is the XrTriangleMeshFB.
- `baseSpace` is the XrSpace that defines the geometry instance's base space for transformations.
- `pose` is the XrPosef that defines the geometry instance's pose.
- `scale` is the XrVector3f that defines the geometry instance's scale.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrGeometryInstanceCreateInfoFB
- `type` **must** be `XR_TYPE_GEOMETRY_INSTANCE_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `layer` **must** be a valid XrPassthroughLayerFB handle
- `mesh` **must** be a valid XrTriangleMeshFB handle
- `baseSpace` **must** be a valid XrSpace handle
- Each of `baseSpace`, `layer`, and `mesh` **must** have been created, allocated, or retrieved from the same XrSession

The XrGeometryInstanceTransformFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrGeometryInstanceTransformFB {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
    XrPosef            pose;
    XrVector3f         scale;
} XrGeometryInstanceTransformFB;
```

It describes a transformation for a geometry instance.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is the XrSpace that defines the geometry instance's base space for transformations.
- `time` is the `XrTime` that define the time at which the transform is applied.
- `pose` is the XrPosef that defines the geometry instance's pose.
- `scale` is the XrVector3f that defines the geometry instance's scale.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrGeometryInstanceTransformFB
- `type` **must** be `XR_TYPE_GEOMETRY_INSTANCE_TRANSFORM_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The XrPassthroughStyleFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughStyleFB {
    XrStructureType    type;
    const void*        next;
    float              textureOpacityFactor;
    XrColor4f          edgeColor;
} XrPassthroughStyleFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `textureOpacityFactor` is the opacity of the passthrough imagery in the range [0, 1].
- `edgeColor` is the XrColor4f that defines the edge rendering color. Edges are detected in the original passthrough imagery and rendered on top of it. Edge rendering is disabled when the alpha value of `edgeColor` is zero.

XrPassthroughStyleFB lets applications customize the appearance of passthrough layers. In addition to the parameters specified here, applications **may** add one of the following structures to the structure chain: XrPassthroughColorMapMonoToRgbaFB, XrPassthroughColorMapMonoToMonoFB, XrPassthroughBrightnessContrastSaturationFB. These structures are mutually exclusive. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if more than one of them are present in the structure chain.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrPassthroughStyleFB
- `type` **must** be `XR_TYPE_PASSTHROUGH_STYLE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrPassthroughBrightnessContrastSaturationFB, XrPassthroughColorMapInterpolatedLutMETA, XrPassthroughColorMapLutMETA, XrPassthroughColorMapMonoToMonoFB, XrPassthroughColorMapMonoToRgbaFB

The XrPassthroughColorMapMonoToRgbaFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughColorMapMonoToRgbaFB {
    XrStructureType    type;
    const void*        next;
    XrColor4f          textureColorMap[XR_PASSTHROUGH_COLOR_MAP_MONO_SIZE_FB];
} XrPassthroughColorMapMonoToRgbaFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `textureColorMap` is an array of XrColor4f colors to which the passthrough imagery luminance values are mapped.

XrPassthroughColorMapMonoToRgbaFB lets applications define a map which replaces each input luminance value in the passthrough imagery with an RGBA color value. The map is applied before any additional effects (such as edges) are rendered on top.

XrPassthroughColorMapMonoToRgbaFB is provided in the `next` chain of XrPassthroughStyleFB.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrPassthroughColorMapMonoToRgbaFB
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_MAP_MONO_TO_RGBA_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrPassthroughColorMapMonoToMonoFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughColorMapMonoToMonoFB {
    XrStructureType    type;
    const void*        next;
    uint8_t            textureColorMap[XR_PASSTHROUGH_COLOR_MAP_MONO_SIZE_FB];
} XrPassthroughColorMapMonoToMonoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `textureColorMap` is an array of `uint8_t` grayscale color values to which the passthrough luminance values are mapped.

XrPassthroughColorMapMonoToMonoFB lets applications define a map which replaces each input luminance value in the passthrough imagery with a grayscale color value defined in `textureColorMap`. The map is applied before any additional effects (such as edges) are rendered on top.

XrPassthroughColorMapMonoToMonoFB is provided in the `next` chain of XrPassthroughStyleFB.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrPassthroughColorMapMonoToMonoFB
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_MAP_MONO_TO_MONO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrPassthroughBrightnessContrastSaturationFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrPassthroughBrightnessContrastSaturationFB {
    XrStructureType    type;
    const void*        next;
    float              brightness;
    float              contrast;
    float              saturation;
} XrPassthroughBrightnessContrastSaturationFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `brightness` is the brightness adjustment value in the range [-100, 100]. The neutral element is 0.
- `contrast` is the contrast adjustment value in the range [0, Infinity]. The neutral element is 1.
- `saturation` is the saturation adjustment value in the range [0, Infinity]. The neutral element is 1.

XrPassthroughBrightnessContrastSaturationFB lets applications adjust the brightness, contrast, and saturation of passthrough layers. The adjustments only are applied before any additional effects (such as edges) are rendered on top.

The adjustments are applied in CIELAB color space (white point D65) using the following formulas:

- L*' = clamp((L* - 50) × contrast + 50, 0, 100)
- L*'' = clamp(L*' + brightness, 0, 100)
- (a*', b*') = (a*, b*) × saturation
- Resulting color: (L*'', a*', b*')

XrPassthroughBrightnessContrastSaturationFB is provided in the `next` chain of XrPassthroughStyleFB.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrPassthroughBrightnessContrastSaturationFB
- `type` **must** be `XR_TYPE_PASSTHROUGH_BRIGHTNESS_CONTRAST_SATURATION_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataPassthroughStateChangedFB structure is defined as:

```
// Provided by XR_FB_passthrough
typedef struct XrEventDataPassthroughStateChangedFB {
    XrStructureType                     type;
    const void*                         next;
    XrPassthroughStateChangedFlagsFB    flags;
} XrEventDataPassthroughStateChangedFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` XrPassthroughStateChangedFlagsFB that specify additional behavior.

It describes event data for state changes returned by xrPollEvent.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to using XrEventDataPassthroughStateChangedFB
- `type` **must** be `XR_TYPE_EVENT_DATA_PASSTHROUGH_STATE_CHANGED_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrCreatePassthroughFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrCreatePassthroughFB(
    XrSession                                   session,
    const XrPassthroughCreateInfoFB*            createInfo,
    XrPassthroughFB*                            outPassthrough);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is the XrPassthroughCreateInfoFB.
- `outPassthrough` is the XrPassthroughFB.

Creates an XrPassthroughFB handle. The returned passthrough handle **may** be subsequently used in API calls. A single XrSession allows only one XrPassthroughFB. If an XrPassthroughFB handle has been already created for this XrSession, the runtime **must** return `XR_ERROR_FEATURE_ALREADY_CREATED_PASSTHROUGH_FB`. If an app requires another feature, then the previous one **must** be destroyed by the app with xrDestroyPassthroughFB first.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrCreatePassthroughFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrPassthroughCreateInfoFB structure
- outPassthrough **must** be a pointer to an XrPassthroughFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_ALREADY_CREATED_PASSTHROUGH_FB
- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_NOT_PERMITTED_PASSTHROUGH_FB
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_UNKNOWN_PASSTHROUGH_FB
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyPassthroughFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrDestroyPassthroughFB(
    XrPassthroughFB                             passthrough);
```

Parameter Descriptions

- `passthrough` is the XrPassthroughFB to be destroyed.

Destroys an XrPassthroughFB handle.

The application is responsible for ensuring that it has no calls using feature handles in progress when the XrPassthroughFB is destroyed.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrDestroyPassthroughFB
- `passthrough` **must** be a valid XrPassthroughFB handle

Thread Safety

- Access to `passthrough`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

The xrPassthroughStartFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrPassthroughStartFB(
    XrPassthroughFB                             passthrough);
```

Parameter Descriptions

- `passthrough` is the XrPassthroughFB to be started.

Starts an XrPassthroughFB feature. If the feature is not started, either explicitly with a call to xrPassthroughStartFB, or implicitly at creation using the behavior flags, it is considered paused. When the feature is paused, runtime will stop rendering and compositing all passthrough layers produced on behalf of the application, and may free up some or all the resources used to produce passthrough until xrPassthroughStartFB is called.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrPassthroughStartFB
- `passthrough` **must** be a valid XrPassthroughFB handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB`
- `XR_ERROR_VALIDATION_FAILURE`

The xrPassthroughPauseFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrPassthroughPauseFB(
    XrPassthroughFB                             passthrough);
```

Parameter Descriptions

- `passthrough` is the XrPassthroughFB to be paused.

Pauses an XrPassthroughFB feature. When the feature is paused, runtime will stop rendering and compositing all passthrough layers produced on behalf of the application, and may free up some or all the resources used to produce passthrough until xrPassthroughStartFB is called.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrPassthroughPauseFB
- `passthrough` **must** be a valid XrPassthroughFB handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB`
- `XR_ERROR_VALIDATION_FAILURE`

The xrCreatePassthroughLayerFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrCreatePassthroughLayerFB(
    XrSession                                   session,
    const XrPassthroughLayerCreateInfoFB*       createInfo,
    XrPassthroughLayerFB*                       outLayer);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is the XrPassthroughLayerCreateInfoFB.
- `outLayer` is the XrPassthroughLayerFB.

Creates an XrPassthroughLayerFB handle. The returned layer handle **may** be subsequently used in API calls. Layer objects may be used to specify rendering properties of the layer, such as styles, and compositing rules.

If XrPassthroughFB has not be created for XrSession before calling this operation, then the runtime **must** return `XR_ERROR_FEATURE_REQUIRED_PASSTHROUGH_FB`.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrCreatePassthroughLayerFB
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrPassthroughLayerCreateInfoFB structure
- `outLayer` **must** be a pointer to an XrPassthroughLayerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_REQUIRED_PASSTHROUGH_FB
- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_INSUFFICIENT_RESOURCES_PASSTHROUGH_FB
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_UNKNOWN_PASSTHROUGH_FB
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyPassthroughLayerFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrDestroyPassthroughLayerFB(
    XrPassthroughLayerFB                        layer);
```

Parameter Descriptions

- layer is the XrPassthroughLayerFB to be destroyed.

Destroys an XrPassthroughLayerFB handle.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrDestroyPassthroughLayerFB
- `layer` **must** be a valid XrPassthroughLayerFB handle

Thread Safety

- Access to `layer`, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

The xrPassthroughLayerPauseFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrPassthroughLayerPauseFB(
    XrPassthroughLayerFB                        layer);
```

Parameter Descriptions

- `layer` is the XrPassthroughLayerFB to be paused.

Pauses an XrPassthroughLayerFB layer. Runtime will not render or composite paused layers.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrPassthroughLayerPauseFB
- `layer` **must** be a valid XrPassthroughLayerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB
- XR_ERROR_VALIDATION_FAILURE

The xrPassthroughLayerResumeFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrPassthroughLayerResumeFB(
    XrPassthroughLayerFB                        layer);
```

Parameter Descriptions

- `layer` is the XrPassthroughLayerFB to be resumed.

Resumes an XrPassthroughLayerFB layer.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrPassthroughLayerResumeFB
- `layer` **must** be a valid XrPassthroughLayerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB
- XR_ERROR_VALIDATION_FAILURE

The xrPassthroughLayerSetStyleFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrPassthroughLayerSetStyleFB(
    XrPassthroughLayerFB                        layer,
    const XrPassthroughStyleFB*                 style);
```

Parameter Descriptions

- `layer` is the XrPassthroughLayerFB to get the style.
- `style` is the XrPassthroughStyleFB to be set.

Sets an XrPassthroughStyleFB style on an XrPassthroughLayerFB layer.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrPassthroughLayerSetStyleFB
- `layer` **must** be a valid XrPassthroughLayerFB handle
- `style` **must** be a pointer to a valid XrPassthroughStyleFB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrCreateGeometryInstanceFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrCreateGeometryInstanceFB(
    XrSession                                   session,
    const XrGeometryInstanceCreateInfoFB*       createInfo,
    XrGeometryInstanceFB*                       outGeometryInstance);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is the XrGeometryInstanceCreateInfoFB.
- `outGeometryInstance` is the XrGeometryInstanceFB.

Creates an XrGeometryInstanceFB handle. Geometry instance functionality requires XR_FB_triangle_mesh extension to be enabled. An XrGeometryInstanceFB connects a layer, a mesh, and a transformation, with the semantics that a specific mesh will be instantiated in a specific layer with a specific transformation. A mesh can be instantiated multiple times, in the same or in different layers.

Valid Usage (Implicit)

- The XR_FB_passthrough extension **must** be enabled prior to calling xrCreateGeometryInstanceFB
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrGeometryInstanceCreateInfoFB structure
- `outGeometryInstance` **must** be a pointer to an XrGeometryInstanceFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_INSUFFICIENT_RESOURCES_PASSTHROUGH_FB
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyGeometryInstanceFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrDestroyGeometryInstanceFB(
    XrGeometryInstanceFB                        instance);
```

Parameter Descriptions

- `instance` is the XrGeometryInstanceFB to be destroyed.

Destroys an XrGeometryInstanceFB handle. Destroying an XrGeometryInstanceFB does not destroy a mesh and does not free mesh resources. Destroying a layer invalidates all geometry instances attached to it. Destroying a mesh invalidates all its instances.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrDestroyGeometryInstanceFB
- `instance` **must** be a valid XrGeometryInstanceFB handle

Thread Safety

- Access to `instance`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

The xrGeometryInstanceSetTransformFB function is defined as:

```
// Provided by XR_FB_passthrough
XrResult xrGeometryInstanceSetTransformFB(
    XrGeometryInstanceFB                        instance,
    const XrGeometryInstanceTransformFB*        transformation);
```

Parameter Descriptions

- `instance` is the XrGeometryInstanceFB to get the transform.
- `transformation` is the XrGeometryInstanceTransformFB to be set.

Sets an XrGeometryInstanceTransformFB transform on an XrGeometryInstanceFB geometry instance.

Valid Usage (Implicit)

- The `XR_FB_passthrough` extension **must** be enabled prior to calling xrGeometryInstanceSetTransformFB
- `instance` **must** be a valid XrGeometryInstanceFB handle
- `transformation` **must** be a pointer to a valid XrGeometryInstanceTransformFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

Issues * Is XrPassthroughFB the parent for XrPassthroughLayerFB? **From OpenXR conventions, it is clear that the XrSession is the parent of XrPassthroughLayerFB, however XrPassthroughLayerFB is also strongly associated to XrPassthroughFB and a reasonable implementation could result in it be invalidated after XrPassthroughFB is destroyed.** In retrospect, (i.e. if we were going to design this extension again), we would explicitly define XrPassthroughFB as the first parameter (and therefore parent, instead of XrSession) in xrCreatePassthroughLayerFB and thus explicitly define XrPassthroughFB as the parent of XrPassthroughLayerFB. ** To avoid potential issues, applications are recommended not to use XrPassthroughLayerFB after XrPassthroughFB has been destroyed. That means that before destroying feature XrPassthroughFB with xrDestroyPassthroughFB, an app should destroy all XrPassthroughLayerFB handles first, by calling xrDestroyPassthroughLayerFB for each such handle.

Version History

- Revision 1, 2021-09-01 (Anton Vaneev)
  - Initial extension description
- Revision 2, 2022-03-16 (Johannes Schmid)
  - Introduce XrPassthroughBrightnessContrastSaturationFB.
  - Revise the documentation of XrPassthroughStyleFB and its descendants.
- Revision 3, 2022-07-14 (Johannes Schmid)
  - Introduce a new struct for querying passthrough system capabilities: XrSystemPassthroughProperties2FB.
  - Introduce a new flag bit that enables submission of depth maps for compositing: `XR_PASSTHROUGH_LAYER_DEPTH_BIT_FB`.
- Revision 4, 2024-06-03 (Rylie Pavlik, Collabora)
  - Correct registry for `XrCompositionLayerPassthroughFB`, note errata regarding field name.
- Revision 5, 2025-01-15 (Ante Trbojevic)
  - Explicitly define that only one XrPassthroughFB handle per XrSession is allowed.
  - Update Issues section with "Is XrPassthroughFB the parent for XrPassthroughLayerFB?"
  - Change wording "Facebook" to "Meta Platforms"

Overview

This extension enables applications to show passthrough hands when hands are placed over the tracked keyboard. It enables users to see their hands over the keyboard in a mixed reality application. This extension is dependent on XR_FB_passthrough extension which can be used to create a passthrough layer for hand presence use-case.

The extension supports a single pair of hands (one left and one right hand), multiple pair of hands are not supported.

This extension allows:

- Creation of keyboard hands passthrough layer using xrCreatePassthroughLayerFB
- Setting the level of intensity for the hand mask in a passthrough layer with purpose XrPassthroughLayerPurposeFB as XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_HANDS_FB or XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_MASKED_HANDS_FB

New Enum Constants

XrPassthroughLayerPurposeFB enumeration is extended with a new constant:

- XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_HANDS_FB - It defines a keyboard hands presence purpose of passthrough layer (i.e. basic mode, without hand transitions).
- XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_MASKED_HANDS_FB - It defines a keyboard hands presence purpose of passthrough layer with keyboard masked hand transitions. A hand mask will

be visible only when hands are inside the region of VR keyboard (i.e. hands over the keyboard).

XrStructureType enumeration is extended with:

- XR_TYPE_PASSTHROUGH_KEYBOARD_HANDS_INTENSITY_FB

New Structures

The XrPassthroughKeyboardHandsIntensityFB structure is defined as:

```
// Provided by XR_FB_passthrough_keyboard_hands
typedef struct XrPassthroughKeyboardHandsIntensityFB {
    XrStructureType    type;
    const void*        next;
    float              leftHandIntensity;
    float              rightHandIntensity;
} XrPassthroughKeyboardHandsIntensityFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- leftHandIntensity defines an intensity for the left tracked hand.
- rightHandIntensity defines an intensity for the right tracked hand.

XrPassthroughKeyboardHandsIntensityFB describes intensities of passthrough hands, and is used as a parameter to xrPassthroughLayerSetKeyboardHandsIntensityFB.

Each of the intensity values leftHandIntensity and rightHandIntensity **must** be in the range [0.0, 1.0]. The hand intensity value represents the level of visibility of rendered hand, the minimal value of the intensity 0.0 represents the fully transparent hand (not visible), the maximal value of 1.0 represented fully opaque hands (maximal visibility).

If either leftHandIntensity or rightHandIntensity is outside the range [0.0, 1.0], the runtime must return XR_ERROR_VALIDATION_FAILURE.

Valid Usage (Implicit)

- The XR_FB_passthrough_keyboard_hands extension **must** be enabled prior to using XrPassthroughKeyboardHandsIntensityFB
- type **must** be XR_TYPE_PASSTHROUGH_KEYBOARD_HANDS_INTENSITY_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

New Functions

The xrPassthroughLayerSetKeyboardHandsIntensityFB function is defined as:

```
// Provided by XR_FB_passthrough_keyboard_hands
XrResult xrPassthroughLayerSetKeyboardHandsIntensityFB(
    XrPassthroughLayerFB                        layer,
    const XrPassthroughKeyboardHandsIntensityFB* intensity);
```

Parameter Descriptions

- layer is the XrPassthroughLayerFB to apply the intensity.
- intensity is the XrPassthroughKeyboardHandsIntensityFB to be set.

Sets an XrPassthroughKeyboardHandsIntensityFB intensity on an XrPassthroughLayerFB layer.

Valid Usage (Implicit)

- The XR_FB_passthrough_keyboard_hands extension **must** be enabled prior to calling xrPassthroughLayerSetKeyboardHandsIntensityFB
- layer **must** be a valid XrPassthroughLayerFB handle
- intensity **must** be a pointer to a valid XrPassthroughKeyboardHandsIntensityFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

Version History

- Revision 1, 2021-11-23 (Ante Trbojevic)
  - Initial extension description
- Revision 2, 2022-03-16 (Ante Trbojevic)
  - Introduce `XR_PASSTHROUGH_LAYER_PURPOSE_TRACKED_KEYBOARD_MASKED_HANDS_FB`

Overview

This extension allows applications to request GLTF models for certain connected devices supported by the runtime. Paths that correspond to these devices will be provided through the extension and can be used to get information about the models as well as loading them.

New Flag Types

```
// Provided by XR_FB_render_model
typedef XrFlags64 XrRenderModelFlagsFB;
```

```
// Provided by XR_FB_render_model
// Flag bits for XrRenderModelFlagsFB
static const XrRenderModelFlagsFB XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_1_BIT_FB =
0x00000001;
static const XrRenderModelFlagsFB XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_2_BIT_FB =
0x00000002;
```

Flag Descriptions

- XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_1_BIT_FB — Minimal level of support. Can only contain a single mesh. Can only contain a single texture. Can not contain transparency. Assumes unlit rendering. Requires Extension KHR_texturebasisu.
- XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_2_BIT_FB — All of XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_1_BIT_FB support plus: Multiple meshes. Multiple Textures. Texture Transparency.

Render Model Support Levels: An application **should** request a model of a certain complexity via the XrRenderModelCapabilitiesRequestFB on the structure chain of XrRenderModelPropertiesFB passed into xrGetRenderModelPropertiesFB. The flags on the XrRenderModelCapabilitiesRequestFB are an acknowledgement of the application's ability to render such a model. Multiple values of XrRenderModelFlagBitsFB can be set on this variable to indicate acceptance of different support levels. The flags parameter on the XrRenderModelPropertiesFB will indicate what capabilities the model in the runtime actually requires. It will be set to a single value of XrRenderModelFlagBitsFB.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_RENDER_MODEL_PROPERTIES_FB
- XR_TYPE_RENDER_MODEL_PATH_INFO_FB
- XR_TYPE_RENDER_MODEL_PROPERTIES_FB
- XR_TYPE_RENDER_MODEL_BUFFER_FB
- XR_TYPE_RENDER_MODEL_LOAD_INFO_FB
- XR_MAX_RENDER_MODEL_NAME_SIZE_FB

New Defines

```
// Provided by XR_FB_render_model
#define XR_NULL_RENDER_MODEL_KEY_FB 0
```

XR_NULL_RENDER_MODEL_KEY_FB defines an invalid model key atom.

New Base Types

```
// Provided by XR_FB_render_model
XR_DEFINE_ATOM(XrRenderModelKeyFB)
```

The unique model key used to retrieve the data for the render model that is valid across multiple instances and installs. The application can use this key along with the model version to update its cached or saved version of the model.

New Structures

The XrSystemRenderModelPropertiesFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrSystemRenderModelPropertiesFB {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsRenderModelLoading;
} XrSystemRenderModelPropertiesFB;
```

It describes a render model system property.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsRenderModelLoading` defines whether the system supports loading render models.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrSystemRenderModelPropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_RENDER_MODEL_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrRenderModelPathInfoFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrRenderModelPathInfoFB {
    XrStructureType    type;
    void*              next;
    XrPath             path;
} XrRenderModelPathInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `path` is a valid `XrPath` used for retrieving model properties from xrGetRenderModelPropertiesFB.

XrRenderModelPathInfoFB contains a model path supported by the device when returned from xrEnumerateRenderModelPathsFB. This path can be used to request information about the render model for the connected device that the path represents using xrGetRenderModelPropertiesFB.

Possible Render Model Paths

- Controller models with origin at the grip pose.
  - */model_fb/controller/left*
  - */model_fb/controller/right*
- Keyboard models with origin at the center of its bounding box.
  - */model_fb/keyboard/local*
  - */model_fb/keyboard/remote*
  - */model_meta/keyboard/virtual*
    (if the `XR_META_virtual_keyboard` extension is enabled)

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrRenderModelPathInfoFB
- `type` **must** be `XR_TYPE_RENDER_MODEL_PATH_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrRenderModelPropertiesFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrRenderModelPropertiesFB {
    XrStructureType         type;
    void*                   next;
    uint32_t                vendorId;
    char                    modelName[XR_MAX_RENDER_MODEL_NAME_SIZE_FB];
    XrRenderModelKeyFB      modelKey;
    uint32_t                modelVersion;
    XrRenderModelFlagsFB    flags;
} XrRenderModelPropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. XrRenderModelCapabilitiesRequestFB is a structure in this structure chain and **should** be linked when this structure is passed to xrGetRenderModelPropertiesFB.
- `vendorId` is the vendor id of the model.
- `modelName` is the name of the model.
- `modelKey` is the unique model key used to load the model in xrLoadRenderModelFB.
- `modelVersion` is the version number of the model.
- `flags` is a bitmask of XrRenderModelFlagsFB. After a successful call to xrGetRenderModelPropertiesFB, flags must contain the support level of the model and no other support levels.

XrRenderModelPropertiesFB contains information about the render model for a device. XrRenderModelPropertiesFB **must** be provided when calling xrGetRenderModelPropertiesFB. The `XrRenderModelKeyFB` included in the properties is a unique key for each render model that is valid across multiple instances and installs.

If the application decides to cache or save the render model in any way, `modelVersion` can be used to determine if the render model has changed. The application **should** then update its cached or saved version.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrRenderModelPropertiesFB
- `type` **must** be `XR_TYPE_RENDER_MODEL_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrRenderModelCapabilitiesRequestFB
- `modelName` **must** be a null-terminated UTF-8 string whose length is less than or equal to `XR_MAX_RENDER_MODEL_NAME_SIZE_FB`
- `flags` **must** be a valid combination of XrRenderModelFlagBitsFB values
- `flags` **must** not be `0`

The XrRenderModelCapabilitiesRequestFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrRenderModelCapabilitiesRequestFB {
    XrStructureType         type;
    void*                   next;
    XrRenderModelFlagsFB    flags;
} XrRenderModelCapabilitiesRequestFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bit mask of the model complexities that the application is able to support.

XrRenderModelCapabilitiesRequestFB contains information about the render capabilities requested for a model. XrRenderModelCapabilitiesRequestFB **must** be set in the structure chain of the `next` pointer on the XrRenderModelPropertiesFB passed into the xrGetRenderModelPropertiesFB call. The `flags` on XrRenderModelCapabilitiesRequestFB represent an acknowledgement of being able to handle the individual model capability levels. If no XrRenderModelCapabilitiesRequestFB is on the structure chain then the runtime **should** treat it as if a value of `XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_1_BIT_FB` was set. If the runtime does not have a model available that matches any of the supports flags set, then it **must** return a `XR_RENDER_MODEL_UNAVAILABLE_FB` result.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrRenderModelCapabilitiesRequestFB
- `type` **must** be `XR_TYPE_RENDER_MODEL_CAPABILITIES_REQUEST_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be a valid combination of XrRenderModelFlagBitsFB values
- `flags` **must** not be `0`

The XrRenderModelLoadInfoFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrRenderModelLoadInfoFB {
    XrStructureType       type;
    void*                 next;
    XrRenderModelKeyFB    modelKey;
} XrRenderModelLoadInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `modelKey` is the unique model key for a connected device.

XrRenderModelLoadInfoFB is used to provide information about which render model to load. XrRenderModelLoadInfoFB **must** be provided when calling xrLoadRenderModelFB.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrRenderModelLoadInfoFB
- `type` **must** be `XR_TYPE_RENDER_MODEL_LOAD_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrRenderModelBufferFB structure is defined as:

```
// Provided by XR_FB_render_model
typedef struct XrRenderModelBufferFB {
    XrStructureType    type;
    void*              next;
    uint32_t           bufferCapacityInput;
    uint32_t           bufferCountOutput;
    uint8_t*           buffer;
} XrRenderModelBufferFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `bufferCapacityInput` is the capacity of the `buffer`, or `0` to retrieve the required capacity.
- `bufferCountOutput` is the count of `uint8_t buffer` written, or the required capacity in the case that `bufferCapacityInput` is insufficient.
- `buffer` is a pointer to an application-allocated array that will be filled with the render model binary data.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

XrRenderModelBufferFB is used when loading the binary data for a render model. XrRenderModelBufferFB **must** be provided when calling xrLoadRenderModelFB.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to using XrRenderModelBufferFB
- `type` **must** be `XR_TYPE_RENDER_MODEL_BUFFER_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` `uint8_t` values

New Functions

The xrEnumerateRenderModelPathsFB function is defined as:

```
// Provided by XR_FB_render_model
XrResult xrEnumerateRenderModelPathsFB(
    XrSession                                   session,
    uint32_t                                    pathCapacityInput,
    uint32_t*                                   pathCountOutput,
    XrRenderModelPathInfoFB*                    paths);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `pathCapacityInput` is the capacity of the `paths`, or 0 to retrieve the required capacity.
- `pathCountOutput` is a pointer to the count of `float paths` written, or a pointer to the required capacity in the case that `pathCapacityInput` is insufficient.
- `paths` is a pointer to an application-allocated array that will be filled with XrRenderModelPathInfoFB values that are supported by the runtime, but **can** be `NULL` if `pathCapacityInput` is `0`
- See the Buffer Size Parameters section for a detailed description of retrieving the required `paths` size.

The application **must** call xrEnumerateRenderModelPathsFB to enumerate the valid render model paths that are supported by the runtime before calling xrGetRenderModelPropertiesFB. The paths returned **may** be used later in xrGetRenderModelPropertiesFB.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to calling xrEnumerateRenderModelPathsFB
- `session` **must** be a valid XrSession handle
- `pathCountOutput` **must** be a pointer to a `uint32_t` value
- If `pathCapacityInput` is not `0`, `paths` **must** be a pointer to an array of `pathCapacityInput` XrRenderModelPathInfoFB structures

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetRenderModelPropertiesFB function is defined as:

```
// Provided by XR_FB_render_model
XrResult xrGetRenderModelPropertiesFB(
    XrSession                                   session,
    XrPath                                      path,
    XrRenderModelPropertiesFB*                  properties);
```

Parameter Descriptions

- session is the specified XrSession.
- path is the path of the render model to get the properties for.
- properties is a pointer to the XrRenderModelPropertiesFB to write the render model information to.

xrGetRenderModelPropertiesFB is used for getting information for a render model using a path retrieved from xrEnumerateRenderModelPathsFB. The information returned will be for the connected device that corresponds to the path given. For example, using */model_fb/controller/left* will return information for the left controller that is currently connected and will change if a different device that also represents a left controller is connected.

The runtime **must** return XR_ERROR_CALL_ORDER_INVALID if xrGetRenderModelPropertiesFB is called with render model paths before calling xrEnumerateRenderModelPathsFB. The runtime **must** return

XR_ERROR_PATH_INVALID if a path not given by xrEnumerateRenderModelPathsFB is used.

If xrGetRenderModelPropertiesFB returns a success code of XR_RENDER_MODEL_UNAVAILABLE_FB and has a XrRenderModelPropertiesFB::modelKey of XR_NULL_RENDER_MODEL_KEY_FB, this indicates that the model for the device is unavailable. The application **may** keep calling xrGetRenderModelPropertiesFB because the model **may** become available later when a device is connected.

Valid Usage (Implicit)

- The XR_FB_render_model extension **must** be enabled prior to calling xrGetRenderModelPropertiesFB
- session **must** be a valid XrSession handle
- properties **must** be a pointer to an XrRenderModelPropertiesFB structure

Return Codes

Success

- XR_SUCCESS
- XR_RENDER_MODEL_UNAVAILABLE_FB
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_PATH_INVALID
- XR_ERROR_PATH_UNSUPPORTED
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrLoadRenderModelFB function is defined as:

```
// Provided by XR_FB_render_model
XrResult xrLoadRenderModelFB(
    XrSession                                   session,
    const XrRenderModelLoadInfoFB*              info,
    XrRenderModelBufferFB*                      buffer);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `info` is a pointer to the XrRenderModelLoadInfoFB structure.
- `buffer` is a pointer to the XrRenderModelBufferFB structure to write the binary data into.

xrLoadRenderModelFB is used to load the GLTF model data using a valid XrRenderModelLoadInfoFB::`modelKey`. xrLoadRenderModelFB loads the model as a byte buffer containing the GLTF in the binary format (GLB). The GLB data **must** conform to the glTF 2.0 format defined at https://registry.khronos.org/glTF/specs/2.0/glTF-2.0.html. The GLB **may** contain texture data in a format that requires the use of the `KHR_texture_basisu` GLTF extension defined at https://github.com/KhronosGroup/glTF/tree/main/extensions/2.0/Khronos/KHR_texture_basisu. Therefore, the application **should** ensure it can handle this extension.

If the device for the requested model is disconnected or does not match the XrRenderModelLoadInfoFB::`modelKey` provided, xrLoadRenderModelFB **must** return `XR_RENDER_MODEL_UNAVAILABLE_FB` as well as an XrRenderModelBufferFB::`bufferCountOutput` value of 0 indicating that the model was not available.

The xrLoadRenderModelFB function **may** be slow, therefore applications **should** call it from a non-time sensitive thread.

Valid Usage (Implicit)

- The `XR_FB_render_model` extension **must** be enabled prior to calling xrLoadRenderModelFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrRenderModelLoadInfoFB structure
- `buffer` **must** be a pointer to an XrRenderModelBufferFB structure

Return Codes

Success

- XR_SUCCESS
- XR_RENDER_MODEL_UNAVAILABLE_FB
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RENDER_MODEL_KEY_INVALID_FB
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

Overview

This extension expands on the concept of spatial entities to include a way for a spatial entity to represent rooms, objects, or other boundaries in a scene.

New Object Types

New Flag Types

```
// Provided by XR_FB_scene
typedef XrFlags64 XrSemanticLabelsSupportFlagsFB;
```

```
// Provided by XR_FB_scene
// Flag bits for XrSemanticLabelsSupportFlagsFB
static const XrSemanticLabelsSupportFlagsFB
XR_SEMANTIC_LABELS_SUPPORT_MULTIPLE_SEMANTIC_LABELS_BIT_FB = 0x00000001;
static const XrSemanticLabelsSupportFlagsFB
XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_DESK_TO_TABLE_MIGRATION_BIT_FB = 0x00000002;
static const XrSemanticLabelsSupportFlagsFB
XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_INVISIBLE_WALL_FACE_BIT_FB = 0x00000004;
```

Flag Descriptions

- XR_SEMANTIC_LABELS_SUPPORT_MULTIPLE_SEMANTIC_LABELS_BIT_FB — If set, and the runtime reports the extensionVersion as 2 or greater, the runtime **may** return multiple semantic labels separated by a comma without spaces. Otherwise, the runtime **must** return a single semantic label.
- XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_DESK_TO_TABLE_MIGRATION_BIT_FB — If set, and the runtime reports the extensionVersion as 3 or greater, the runtime **must** return "TABLE" instead of "DESK" as a semantic label to the application. Otherwise, the runtime **must** return "DESK" instead of "TABLE" as a semantic label to the application, when applicable.
- XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_INVISIBLE_WALL_FACE_BIT_FB — If set, and the runtime reports the extensionVersion as 4 or greater, the runtime **may** return "INVISIBLE_WALL_FACE" instead of "WALL_FACE" as a semantic label to the application in order to represent an invisible wall used to conceptually separate a space (e.g., separate a living space from a kitchen space in an open floor plan house even though there is no real wall between the two spaces) instead of a real wall. Otherwise, the runtime **must** return "WALL_FACE" as a semantic label to the application in order to represent both an invisible and real wall, when applicable.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SEMANTIC_LABELS_FB
- XR_TYPE_ROOM_LAYOUT_FB
- XR_TYPE_BOUNDARY_2D_FB
- XR_TYPE_SEMANTIC_LABELS_SUPPORT_INFO_FB

New Enums

New Structures

The XrExtent3DfFB structure is defined as:

```
// Provided by XR_FB_scene
// XrExtent3DfFB is an alias for XrExtent3Df
typedef struct XrExtent3Df {
    float    width;
    float    height;
    float    depth;
} XrExtent3Df;

typedef XrExtent3Df XrExtent3DfFB;
```

Member Descriptions

- `width` is the floating-point width of the extent.
- `height` is the floating-point height of the extent.
- `depth` is the floating-point depth of the extent.

This structure is used for component values that may be fractional (floating-point). If used to represent physical distances, values must be in meters. The width, height, and depth values must be non-negative.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to using XrExtent3DfFB

The XrOffset3DfFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrOffset3DfFB {
    float    x;
    float    y;
    float    z;
} XrOffset3DfFB;
```

Member Descriptions

- `x` is the floating-point offset in the x direction.
- `y` is the floating-point offset in the y direction.
- `z` is the floating-point offset in the z direction.

This structure is used for component values that may be fractional (floating-point). If used to represent physical distances, values must be in meters.

Valid Usage (Implicit)

- The XR_FB_scene extension **must** be enabled prior to using XrOffset3DfFB

The XrRect3DfFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrRect3DfFB {
    XrOffset3DfFB    offset;
    XrExtent3DfFB    extent;
} XrRect3DfFB;
```

Member Descriptions

- `offset` is the XrOffset3DfFB specifying the rectangle offset.
- `extent` is the XrExtent3DfFB specifying the rectangle extent.

This structure is used for component values that may be fractional (floating-point).

The bounding box is defined by an `offset` and `extent`. The `offset` refers to the coordinate of the minimum corner of the box in the local space of the XrSpace; that is, the corner whose coordinate has the minimum value on each axis. The `extent` refers to the dimensions of the box along each axis. The maximum corner can therefore be computed as `offset` + `extent`.

Valid Usage (Implicit)

- The XR_FB_scene extension **must** be enabled prior to using XrRect3DfFB

The XrSemanticLabelsFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrSemanticLabelsFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           bufferCapacityInput;
    uint32_t           bufferCountOutput;
    char*              buffer;
} XrSemanticLabelsFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain, such as XrSemanticLabelsSupportInfoFB.
- `bufferCapacityInput` is the capacity of the `buffer` array, in bytes, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` is the count of bytes written, or the required capacity in the case that `bufferCapacityInput` is insufficient.
- `buffer` is a pointer to an array of bytes, but can be `NULL` if `bufferCapacityInput` is 0. Multiple labels represented by raw string, separated by a comma without spaces.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

This structure is used by the xrGetSpaceSemanticLabelsFB function to provide the application with the intended usage of the spatial entity.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to using XrSemanticLabelsFB
- `type` **must** be `XR_TYPE_SEMANTIC_LABELS_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSemanticLabelsSupportInfoFB
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` char values

The XrRoomLayoutFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrRoomLayoutFB {
    XrStructureType    type;
    const void*        next;
    XrUuidEXT          floorUuid;
    XrUuidEXT          ceilingUuid;
    uint32_t           wallUuidCapacityInput;
    uint32_t           wallUuidCountOutput;
    XrUuidEXT*         wallUuids;
} XrRoomLayoutFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `floorUuid` is the UUID of the spatial entity representing the room floor
- `ceilingUuid` is the UUID of the spatial entity representing the room ceiling
- `wallUuidCapacityInput` is the capacity of the `wallUuids` array, in number of UUIDs, or 0 to indicate a request to retrieve the required capacity.
- `wallUuidCountOutput` is the count of XrUuidEXT handles written, or the required capacity in the case that `wallUuidCapacityInput` is insufficient.
- `wallUuids` is a pointer to an array of XrUuidEXT handles, but can be `NULL` if `wallUuidCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `wallUuids` array size.

This structure is used by the xrGetSpaceRoomLayoutFB function to provide the application with the XrUuidEXT handles representing the various surfaces of a room.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to using XrRoomLayoutFB
- `type` **must** be `XR_TYPE_ROOM_LAYOUT_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `wallUuidCapacityInput` is not `0`, `wallUuids` **must** be a pointer to an array of `wallUuidCapacityInput` XrUuidEXT structures

The XrBoundary2DFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrBoundary2DFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector2f*        vertices;
} XrBoundary2DFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCapacityInput` is the capacity of the `vertices` array, in number of vertices, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is the count of XrVector2f written, or the required capacity in the case that `vertexCapacityInput` is insufficient.
- `vertices` is a pointer to an array of XrVector2f, but **can** be `NULL` if `vertexCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `vertices` array size.

This structure is used by the xrGetSpaceBoundary2DFB function to provide the application with the XrVector2f vertices representing the a spatial entity with a boundary.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to using XrBoundary2DFB
- `type` **must** be `XR_TYPE_BOUNDARY_2D_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `vertexCapacityInput` is not `0`, `vertices` **must** be a pointer to an array of `vertexCapacityInput` XrVector2f structures

The XrSemanticLabelsSupportInfoFB structure is defined as:

```
// Provided by XR_FB_scene
typedef struct XrSemanticLabelsSupportInfoFB {
    XrStructureType                   type;
    const void*                       next;
    XrSemanticLabelsSupportFlagsFB    flags;
    const char*                       recognizedLabels;
} XrSemanticLabelsSupportInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrSemanticLabelsSupportFlagBitsFB that specifies additional behaviors.
- `recognizedLabels` is a `NULL` terminated string that indicates a set of semantic labels recognized by the application. Each semantic label **must** be represented as a string and be separated by a comma without spaces. This field **must** include at least "OTHER" and **must** not be `NULL`.

The XrSemanticLabelsSupportInfoFB structure **may** be specified in the `next` chain of XrSemanticLabelsFB to specify additional behaviors of the xrGetSpaceSemanticLabelsFB function. The runtime **must** follow the behaviors specified in `flags` according to the descriptions of XrSemanticLabelsSupportFlagBitsFB. The runtime **must** return any semantic label that is not included in `recognizedLabels` as "OTHER" to the application. The runtime **must** follow this direction only if the runtime reports the XrExtensionProperties::`extensionVersion` as 2 or greater, otherwise the runtime **must** ignore this as an unknown chained structure.

If the XrSemanticLabelsSupportInfoFB structure is not present in the `next` chain of XrSemanticLabelsFB, the runtime **may** return any semantic labels to the application.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to using XrSemanticLabelsSupportInfoFB
- `type` **must** be `XR_TYPE_SEMANTIC_LABELS_SUPPORT_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrSemanticLabelsSupportFlagBitsFB values
- `recognizedLabels` **must** be a null-terminated UTF-8 string

New Functions

The xrGetSpaceBoundingBox2DFB function is defined as:

```
// Provided by XR_FB_scene
XrResult xrGetSpaceBoundingBox2DFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrRect2Df*                                  boundingBox2DOutput);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `space` is the XrSpace handle to the spatial entity.
- `boundingBox2DOutput` is an output parameter pointing to the structure containing the 2D bounding box for `space`.

Gets the 2D bounding box for a spatial entity with the `XR_SPACE_COMPONENT_TYPE_BOUNDED_2D_FB` component type enabled.

The bounding box is defined by an XrRect2Df::`offset` and XrRect2Df::`extent`. The XrRect2Df::`offset` refers to the coordinate of the minimum corner of the box in the x-y plane of the given XrSpace's coordinate system; that is, the corner whose coordinate has the minimum value on each axis. The XrRect2Df::`extent` refers to the dimensions of the box along each axis. The maximum corner can therefore be computed as XrRect2Df::`offset` + XrRect2Df::`extent`.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to calling xrGetSpaceBoundingBox2DFB
- `session` **must** be a valid XrSession handle
- `space` **must** be a valid XrSpace handle
- `boundingBox2DOutput` **must** be a pointer to an XrRect2Df structure
- `space` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The xrGetSpaceBoundingBox3DFB function is defined as:

```
// Provided by XR_FB_scene
XrResult xrGetSpaceBoundingBox3DFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrRect3DfFB*                                boundingBox3DOutput);
```

Parameter Descriptions

- session is a handle to an XrSession.
- space is the XrSpace handle to the spatial entity.
- boundingBox3DOutput is an output parameter pointing to the structure containing the 3D bounding box for space.

Gets the 3D bounding box for a spatial entity with the XR_SPACE_COMPONENT_TYPE_BOUNDED_3D_FB component type enabled.

Valid Usage (Implicit)

- The XR_FB_scene extension **must** be enabled prior to calling xrGetSpaceBoundingBox3DFB
- session **must** be a valid XrSession handle
- space **must** be a valid XrSpace handle
- boundingBox3DOutput **must** be a pointer to an XrRect3DfFB structure
- space **must** have been created, allocated, or retrieved from session

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The xrGetSpaceSemanticLabelsFB function is defined as:

```
// Provided by XR_FB_scene
XrResult xrGetSpaceSemanticLabelsFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrSemanticLabelsFB*                         semanticLabelsOutput);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `space` is the XrSpace handle to the spatial entity.
- `semanticLabelsOutput` is an output parameter pointing to the structure containing the XrSemanticLabelsFB for `space`.

Gets the semantic labels for a spatial entity with the `XR_SPACE_COMPONENT_TYPE_SEMANTIC_LABELS_FB` component type enabled.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to calling xrGetSpaceSemanticLabelsFB
- `session` **must** be a valid XrSession handle
- `space` **must** be a valid XrSpace handle
- `semanticLabelsOutput` **must** be a pointer to an XrSemanticLabelsFB structure
- `space` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`
- `XR_ERROR_VALIDATION_FAILURE`

The xrGetSpaceBoundary2DFB function is defined as:

```
// Provided by XR_FB_scene
XrResult xrGetSpaceBoundary2DFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrBoundary2DFB*                             boundary2DOutput);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `space` is the XrSpace handle to the spatial entity.
- `boundary2DOutput` is an output parameter pointing to the structure containing the XrBoundary2DFB for `space`.

Gets the 2D boundary, specified by vertices, for a spatial entity with the `XR_SPACE_COMPONENT_TYPE_BOUNDED_2D_FB` component type enabled.

Valid Usage (Implicit)

- The `XR_FB_scene` extension **must** be enabled prior to calling xrGetSpaceBoundary2DFB
- `session` **must** be a valid XrSession handle
- `space` **must** be a valid XrSpace handle
- `boundary2DOutput` **must** be a pointer to an XrBoundary2DFB structure
- `space` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The xrGetSpaceRoomLayoutFB function is defined as:

```
// Provided by XR_FB_scene
XrResult xrGetSpaceRoomLayoutFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrRoomLayoutFB*                             roomLayoutOutput);
```

Parameter Descriptions

- session is a handle to an XrSession.
- space is the XrSpace handle to the spatial entity.
- roomLayoutOutput is an output parameter pointing to the structure containing the XrRoomLayoutFB for space.

Gets the room layout, specified by UUIDs for each surface, for a spatial entity with the XR_SPACE_COMPONENT_TYPE_ROOM_LAYOUT_FB component type enabled.

If the XrRoomLayoutFB::wallUuidCapacityInput field is zero (indicating a request to retrieve the required capacity for the XrRoomLayoutFB::wallUuids array), or if xrGetSpaceRoomLayoutFB returns failure, then the values of floorUuid and ceilingUuid are unspecified and should not be used.

Valid Usage (Implicit)

- The XR_FB_scene extension **must** be enabled prior to calling xrGetSpaceRoomLayoutFB
- session **must** be a valid XrSession handle
- space **must** be a valid XrSpace handle
- roomLayoutOutput **must** be a pointer to an XrRoomLayoutFB structure
- space **must** have been created, allocated, or retrieved from session

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

Issues

Version History

- Revision 1, 2022-03-09 (John Schofield)
  - Initial draft
- Revision 2, 2023-04-03 (Yuichi Taguchi)
  - Introduce XrSemanticLabelsSupportInfoFB.
- Revision 3, 2023-04-03 (Yuichi Taguchi)
  - Introduce XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_DESK_TO_TABLE_MIGRATION_BIT_FB.

- Revision 4, 2023-06-12 (Yuichi Taguchi)
    - Introduce `XR_SEMANTIC_LABELS_SUPPORT_ACCEPT_INVISIBLE_WALL_FACE_BIT_FB`.

Overview

This extension allows an application to request that the system begin capturing information about what is in the environment around the user.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SCENE_CAPTURE_REQUEST_INFO_FB`
- `XR_TYPE_EVENT_DATA_SCENE_CAPTURE_COMPLETE_FB`

New Enums

New Structures

The XrSceneCaptureRequestInfoFB structure is defined as:

```
// Provided by XR_FB_scene_capture
typedef struct XrSceneCaptureRequestInfoFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           requestByteCount;
    const char*        request;
} XrSceneCaptureRequestInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestByteCount` is byte length of the `request` parameter.
- `request` is a string which the application **can** use to specify which type of scene capture should be initiated by the runtime. The contents of buffer pointed to by the `request` parameter is runtime-specific.

The XrSceneCaptureRequestInfoFB structure is used by an application to instruct the system what to look for during a scene capture. If the `request` parameter is `NULL`, then the runtime **must** conduct a default scene capture.

Valid Usage (Implicit)

- The `XR_FB_scene_capture` extension **must** be enabled prior to using XrSceneCaptureRequestInfoFB
- `type` **must** be `XR_TYPE_SCENE_CAPTURE_REQUEST_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `requestByteCount` is not `0`, `request` **must** be a pointer to an array of `requestByteCount` char values

The XrEventDataSceneCaptureCompleteFB structure is defined as:

```
// Provided by XR_FB_scene_capture
typedef struct XrEventDataSceneCaptureCompleteFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSceneCaptureCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous query request.
- `result` is an XrResult that indicates if the request succeeded or if an error occurred.

The XrEventDataSceneCaptureCompleteFB structure is used by an application to instruct the system what to look for during a scene capture.

Valid Usage (Implicit)

- The `XR_FB_scene_capture` extension **must** be enabled prior to using XrEventDataSceneCaptureCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SCENE_CAPTURE_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrRequestSceneCaptureFB function is defined as:

```
// Provided by XR_FB_scene_capture
XrResult xrRequestSceneCaptureFB(
    XrSession                                   session,
    const XrSceneCaptureRequestInfoFB*          info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` is an XrSceneCaptureRequestInfoFB which specifies how the scene capture should occur.
- `requestId` is the output parameter that points to the ID of this asynchronous request.

The xrRequestSceneCaptureFB function is used by an application to begin capturing the scene around the user. This is an asynchronous operation.

Valid Usage (Implicit)

- The `XR_FB_scene_capture` extension **must** be enabled prior to calling xrRequestSceneCaptureFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSceneCaptureRequestInfoFB structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Overview

This extension enables applications to use spatial entities to specify world-locked frames of reference. It enables applications to persist the real world location of content over time and contains definitions for the Entity-Component System. All Facebook spatial entity and scene extensions are dependent on this one.

We use OpenXR XrSpace handles to give applications access to spatial entities such as Spatial Anchors. In other words, any operation which involves spatial entities uses XrSpace handles to identify the affected spatial entities.

This extension allows:

- An application to create a Spatial Anchor (a type of spatial entity).
- An application to enumerate supported components for a given spatial entity.

- An application to enable or disable a component for a given spatial entity.
- An application to get the status of a component for a given spatial entity.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_SPATIAL_ENTITY_PROPERTIES_FB
- XR_TYPE_SPATIAL_ANCHOR_CREATE_INFO_FB
- XR_TYPE_SPACE_COMPONENT_STATUS_SET_INFO_FB
- XR_TYPE_SPACE_COMPONENT_STATUS_FB
- XR_TYPE_EVENT_DATA_SPATIAL_ANCHOR_CREATE_COMPLETE_FB
- XR_TYPE_EVENT_DATA_SPACE_SET_STATUS_COMPLETE_FB

XrResult enumeration is extended with:

- XR_ERROR_SPACE_COMPONENT_NOT_SUPPORTED_FB
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_SPACE_COMPONENT_STATUS_PENDING_FB
- XR_ERROR_SPACE_COMPONENT_STATUS_ALREADY_SET_FB

New Enums

```
// Provided by XR_FB_spatial_entity
typedef enum XrSpaceComponentTypeFB {
    XR_SPACE_COMPONENT_TYPE_LOCATABLE_FB = 0,
    XR_SPACE_COMPONENT_TYPE_STORABLE_FB = 1,
    XR_SPACE_COMPONENT_TYPE_SHARABLE_FB = 2,
    XR_SPACE_COMPONENT_TYPE_BOUNDED_2D_FB = 3,
    XR_SPACE_COMPONENT_TYPE_BOUNDED_3D_FB = 4,
    XR_SPACE_COMPONENT_TYPE_SEMANTIC_LABELS_FB = 5,
    XR_SPACE_COMPONENT_TYPE_ROOM_LAYOUT_FB = 6,
    XR_SPACE_COMPONENT_TYPE_SPACE_CONTAINER_FB = 7,
  // Provided by XR_META_spatial_entity_mesh
    XR_SPACE_COMPONENT_TYPE_TRIANGLE_MESH_META = 1000269000,
  // Provided by XR_META_spatial_entity_room_mesh
    XR_SPACE_COMPONENT_TYPE_ROOM_MESH_META = 1000553000,
    XR_SPACE_COMPONENT_TYPE_MAX_ENUM_FB = 0x7FFFFFFF
} XrSpaceComponentTypeFB;
```

Specify the component interfaces attached to the spatial entity.

Enumerant Descriptions

- XR_SPACE_COMPONENT_TYPE_LOCATABLE_FB — Enables tracking the 6 DOF pose of the XrSpace with xrLocateSpace.
- XR_SPACE_COMPONENT_TYPE_STORABLE_FB — Enables persistence operations: save and erase.
- XR_SPACE_COMPONENT_TYPE_SHARABLE_FB — Enables sharing of spatial entities.
- XR_SPACE_COMPONENT_TYPE_BOUNDED_2D_FB — Bounded 2D component.
- XR_SPACE_COMPONENT_TYPE_BOUNDED_3D_FB — Bounded 3D component.
- XR_SPACE_COMPONENT_TYPE_SEMANTIC_LABELS_FB — Semantic labels component.
- XR_SPACE_COMPONENT_TYPE_ROOM_LAYOUT_FB — Room layout component.
- XR_SPACE_COMPONENT_TYPE_SPACE_CONTAINER_FB — Space container component.
- XR_SPACE_COMPONENT_TYPE_TRIANGLE_MESH_META — Triangle mesh component. (Added by the XR_META_spatial_entity_mesh extension)
- XR_SPACE_COMPONENT_TYPE_ROOM_MESH_META — Room mesh component. (Added by the XR_META_spatial_entity_room_mesh extension)

New Base Types

The XrAsyncRequestIdFB base type is defined as:

```
// Provided by XR_FB_spatial_entity
XR_DEFINE_ATOM(XrAsyncRequestIdFB)
```

Represents a request to the spatial entity system. Several functions in this and other extensions will populate an output variable of this type so that an application **can** use it when referring to a specific request.

New Structures

The XrSystemSpatialEntityPropertiesFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrSystemSpatialEntityPropertiesFB {
    XrStructureType    type;
    const void*        next;
    XrBool32           supportsSpatialEntity;
} XrSystemSpatialEntityPropertiesFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsSpatialEntity` is a boolean value that determines if spatial entities are supported by the system.

An application **can** inspect whether the system is capable of spatial entity operations by extending the XrSystemProperties with XrSystemSpatialEntityPropertiesFB structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsSpatialEntity`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrGetSpaceUuidFB.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrSystemSpatialEntityPropertiesFB
- `type` **must** be `XR_TYPE_SYSTEM_SPATIAL_ENTITY_PROPERTIES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSpatialAnchorCreateInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrSpatialAnchorCreateInfoFB {
    XrStructureType    type;
    const void*        next;
    XrSpace            space;
    XrPosef            poseInSpace;
    XrTime             time;
} XrSpatialAnchorCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is the XrSpace handle to the reference space that defines the `poseInSpace` of the anchor to be defined.
- `poseInSpace` is the XrPosef location and orientation of the Spatial Anchor in the specified reference space.
- `time` is the `XrTime` timestamp associated with the specified pose.

Parameters to create a new spatial anchor.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrSpatialAnchorCreateInfoFB
- `type` **must** be `XR_TYPE_SPATIAL_ANCHOR_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle

The XrSpaceComponentStatusSetInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrSpaceComponentStatusSetInfoFB {
    XrStructureType           type;
    const void*               next;
    XrSpaceComponentTypeFB    componentType;
    XrBool32                  enabled;
    XrDuration                timeout;
} XrSpaceComponentStatusSetInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `componentType` is the component whose status is to be set.
- `enabled` is the value to set the component to.
- `timeout` is the number of nanoseconds before the operation should be cancelled. A value of XR_INFINITE_DURATION indicates to never time out. See Duration for more details.

Enables or disables the specified component for the specified spatial entity.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrSpaceComponentStatusSetInfoFB
- `type` **must** be `XR_TYPE_SPACE_COMPONENT_STATUS_SET_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `componentType` **must** be a valid XrSpaceComponentTypeFB value

The XrSpaceComponentStatusFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrSpaceComponentStatusFB {
    XrStructureType    type;
    void*              next;
    XrBool32           enabled;
    XrBool32           changePending;
} XrSpaceComponentStatusFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `enabled` is a boolean value that determines if a component is currently enabled or disabled.
- `changePending` is a boolean value that determines if the component's enabled state is about to change.

It holds information on the current state of a component.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrSpaceComponentStatusFB
- `type` **must** be `XR_TYPE_SPACE_COMPONENT_STATUS_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataSpatialAnchorCreateCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrEventDataSpatialAnchorCreateCompleteFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
    XrSpace               space;
    XrUuidEXT             uuid;
} XrEventDataSpatialAnchorCreateCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request used to create a new spatial anchor.
- `result` is an XrResult that determines if the request succeeded or if an error occurred.
- `space` is the XrSpace handle to the newly created spatial anchor.
- `uuid` is the UUID of the newly created spatial anchor.

It describes the result of a request to create a new spatial anchor. Once this event is posted, it is the applications responsibility to take ownership of the XrSpace. The XrSession passed into xrCreateSpatialAnchorFB is the parent handle of the newly created XrSpace.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrEventDataSpatialAnchorCreateCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPATIAL_ANCHOR_CREATE_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataSpaceSetStatusCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity
typedef struct XrEventDataSpaceSetStatusCompleteFB {
    XrStructureType           type;
    const void*               next;
    XrAsyncRequestIdFB        requestId;
    XrResult                  result;
    XrSpace                   space;
    XrUuidEXT                 uuid;
    XrSpaceComponentTypeFB    componentType;
    XrBool32                  enabled;
} XrEventDataSpaceSetStatusCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request used to enable or disable a component.
- `result` is an XrResult that describes whether the request succeeded or if an error occurred.
- `space` is the XrSpace handle to the spatial entity.
- `uuid` is the UUID of the spatial entity.
- `componentType` is the type of component being enabled or disabled.
- `enabled` is a boolean value indicating whether the component is now enabled or disabled.

It describes the result of a request to enable or disable a component of a spatial entity.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrEventDataSpaceSetStatusCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_SET_STATUS_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrCreateSpatialAnchorFB function is defined as:

```
// Provided by XR_FB_spatial_entity
XrResult xrCreateSpatialAnchorFB(
    XrSession                                   session,
    const XrSpatialAnchorCreateInfoFB*          info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` is a pointer to an XrSpatialAnchorCreateInfoFB structure containing information about how to create the anchor.
- `requestId` is the output parameter that points to the ID of this asynchronous request.

Creates a Spatial Anchor using the specified tracking origin and pose relative to the specified tracking origin. The anchor will be locatable at the time of creation, and the 6 DOF pose relative to the tracking origin **can** be queried using the xrLocateSpace method. This operation is asynchronous and the runtime **must** post an XrEventDataSpatialAnchorCreateCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted. The `requestId` **can** be used to later refer to the request, such as identifying which request has completed when an XrEventDataSpatialAnchorCreateCompleteFB is posted to the event queue.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to calling xrCreateSpatialAnchorFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpatialAnchorCreateInfoFB structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

The xrGetSpaceUuidFB function is defined as:

```
// Provided by XR_FB_spatial_entity
XrResult xrGetSpaceUuidFB(
    XrSpace                                     space,
    XrUuidEXT*                                  uuid);
```

Parameter Descriptions

- `space` is the XrSpace handle of a spatial entity.
- `uuid` is an output parameter pointing to the entity's UUID.

Gets the UUID for a spatial entity. If this space was previously created as a spatial anchor, `uuid` **must** be equal to the XrEventDataSpatialAnchorCreateCompleteFB::`uuid` in the event corresponding to the creation of that space. Subsequent calls to xrGetSpaceUuidFB using the same XrSpace **must** return the same XrUuidEXT.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to calling xrGetSpaceUuidFB
- `space` **must** be a valid XrSpace handle
- `uuid` **must** be a pointer to an XrUuidEXT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrEnumerateSpaceSupportedComponentsFB function is defined as:

```
// Provided by XR_FB_spatial_entity
XrResult xrEnumerateSpaceSupportedComponentsFB(
    XrSpace                                     space,
    uint32_t                                    componentTypeCapacityInput,
    uint32_t*                                   componentTypeCountOutput,
    XrSpaceComponentTypeFB*                     componentTypes);
```

Parameter Descriptions

- `space` is the XrSpace handle to the spatial entity.
- `componentTypeCapacityInput` is the capacity of the `componentTypes` array, or 0 to indicate a request to retrieve the required capacity.
- `componentTypeCountOutput` is a pointer to the count of `componentTypes` written, or a pointer to the required capacity in the case that `componentTypeCapacityInput` is insufficient.
- `componentTypes` is a pointer to an array of XrSpaceComponentTypeFB values, but **can** be `NULL` if `componentTypeCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `componentTypes` size.

Lists any component types that an entity supports. The list of component types available for an entity depends on which extensions are enabled. Component types **must** not be enumerated unless the corresponding extension that defines them is also enabled.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to calling xrEnumerateSpaceSupportedComponentsFB
- `space` **must** be a valid XrSpace handle
- `componentTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `componentTypeCapacityInput` is not `0`, `componentTypes` **must** be a pointer to an array of `componentTypeCapacityInput` XrSpaceComponentTypeFB values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrSetSpaceComponentStatusFB function is defined as:

```
// Provided by XR_FB_spatial_entity
XrResult xrSetSpaceComponentStatusFB(
    XrSpace                                     space,
    const XrSpaceComponentStatusSetInfoFB*      info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- space is the XrSpace handle to the spatial entity.
- info is a pointer to an XrSpaceComponentStatusSetInfoFB structure containing information about the component to be enabled or disabled.
- requestId is the output parameter that points to the ID of this asynchronous request.

Enables or disables the specified component for the specified entity. This operation is asynchronous and always returns immediately, regardless of the value of XrSpaceComponentStatusSetInfoFB ::timeout. The requestId **can** be used to later refer to the request, such as identifying which request has completed when an XrEventDataSpaceSetStatusCompleteFB is posted to the event queue. If this function returns a failure code, no event is posted. This function **must** return XR_ERROR_SPACE_COMPONENT_NOT_SUPPORTED_FB if the XrSpace does not support the specified component type.

Valid Usage (Implicit)

- The XR_FB_spatial_entity extension **must** be enabled prior to calling xrSetSpaceComponentStatusFB
- space **must** be a valid XrSpace handle
- info **must** be a pointer to a valid XrSpaceComponentStatusSetInfoFB structure
- requestId **must** be a pointer to an XrAsyncRequestIdFB value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_COMPONENT_NOT_SUPPORTED_FB
- XR_ERROR_SPACE_COMPONENT_STATUS_ALREADY_SET_FB
- XR_ERROR_SPACE_COMPONENT_STATUS_PENDING_FB
- XR_ERROR_VALIDATION_FAILURE

The xrGetSpaceComponentStatusFB function is defined as:

```
// Provided by XR_FB_spatial_entity
XrResult xrGetSpaceComponentStatusFB(
    XrSpace                                     space,
    XrSpaceComponentTypeFB                      componentType,
    XrSpaceComponentStatusFB*                   status);
```

Parameter Descriptions

- `space` is the XrSpace handle of a spatial entity.
- `componentType` is the component type to query.
- `status` is an output parameter pointing to the structure containing the status of the component that was queried.

Gets the current status of the specified component for the specified entity. This function **must** return `XR_ERROR_SPACE_COMPONENT_NOT_SUPPORTED_FB` if the XrSpace does not support the specified component type.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to calling xrGetSpaceComponentStatusFB
- `space` **must** be a valid XrSpace handle
- `componentType` **must** be a valid XrSpaceComponentTypeFB value
- `status` **must** be a pointer to an XrSpaceComponentStatusFB structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPACE_COMPONENT_NOT_SUPPORTED_FB`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

Version History

- Revision 1, 2022-01-22 (John Schofield)
  - Initial draft
- Revision 2, 2023-01-18 (Andrew Kim)
  - Added a new component enum value
- Revision 3, 2023-01-30 (Wenlin Mao)
  - Drop requirement for `XR_EXT_uuid` must be enabled

Overview

This extension expands on the concept of spatial entities to include a way for one spatial entity to contain multiple child spatial entities, forming a hierarchy.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SPACE_CONTAINER_FB

New Enums

New Structures

The XrSpaceContainerFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_container
typedef struct XrSpaceContainerFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           uuidCapacityInput;
    uint32_t           uuidCountOutput;
    XrUuidEXT*         uuids;
} XrSpaceContainerFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- uuidCapacityInput is the capacity of the uuids array, or 0 to indicate a request to retrieve the required capacity.
- uuidCountOutput is an output parameter which will hold the number of UUIDs included in the output list, or the required capacity in the case that uuidCapacityInput is insufficient
- uuids is an output parameter which will hold a list of space UUIDs contained by the space to which the component is attached.
- See the Buffer Size Parameters section for a detailed description of retrieving the required uuids size.

The XrSpaceContainerFB structure **can** be used by an application to perform the two calls required to obtain information about which spatial entities are contained by a specified spatial entity.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_container extension **must** be enabled prior to using XrSpaceContainerFB
- type **must** be XR_TYPE_SPACE_CONTAINER_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If uuidCapacityInput is not 0, uuids **must** be a pointer to an array of uuidCapacityInput XrUuidEXT structures

New Functions

The xrGetSpaceContainerFB function is defined as:

```
// Provided by XR_FB_spatial_entity_container
XrResult xrGetSpaceContainerFB(
    XrSession                                   session,
    XrSpace                                     space,
    XrSpaceContainerFB*                         spaceContainerOutput);
```

Parameter Descriptions

- session is a handle to an XrSession.
- space is a handle to an XrSpace.
- spaceContainerOutput is the output parameter that points to an XrSpaceContainerFB containing information about which spaces are contained by space.

The xrGetSpaceContainerFB function is used by an application to perform the two calls required to obtain information about which spatial entities are contained by a specified spatial entity.

The XR_SPACE_COMPONENT_TYPE_SPACE_CONTAINER_FB component type **must** be enabled, otherwise this function will return XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_container` extension **must** be enabled prior to calling xrGetSpaceContainerFB
- `session` **must** be a valid XrSession handle
- `space` **must** be a valid XrSpace handle
- `spaceContainerOutput` **must** be a pointer to an XrSpaceContainerFB structure
- `space` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

Version History

- Revision 1, 2022-03-09 (John Schofield)
  - Initial draft
- Revision 2, 2022-05-31 (John Schofield)
  - Fix types of `XrSpaceContainerFB` fields.

12.123. XR_FB_spatial_entity_query

Andrew Kim, Facebook
Yuichi Taguchi, Facebook
Cass Everitt, Facebook
Curtis Arink, Facebook

Overview

This extension enables an application to discover persistent spatial entities in the area and restore them. Using the query system, the application **can** load persistent spatial entities from storage. The query system consists of a set of filters to define the spatial entity search query and an operation that needs to be performed on the search results.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SPACE_QUERY_INFO_FB`
- `XR_TYPE_SPACE_QUERY_RESULTS_FB`

- XR_TYPE_SPACE_STORAGE_LOCATION_FILTER_INFO_FB
- XR_TYPE_SPACE_UUID_FILTER_INFO_FB
- XR_TYPE_SPACE_COMPONENT_FILTER_INFO_FB
- XR_TYPE_EVENT_DATA_SPACE_QUERY_RESULTS_AVAILABLE_FB
- XR_TYPE_EVENT_DATA_SPACE_QUERY_COMPLETE_FB

New Enums

```
// Provided by XR_FB_spatial_entity_query
typedef enum XrSpaceQueryActionFB {
    XR_SPACE_QUERY_ACTION_LOAD_FB = 0,
    XR_SPACE_QUERY_ACTION_MAX_ENUM_FB = 0x7FFFFFFF
} XrSpaceQueryActionFB;
```

Specify the type of query being performed.

Enumerant Descriptions

- XR_SPACE_QUERY_ACTION_LOAD_FB — Tells the query to perform a load operation on any XrSpace returned by the query.

New Structures

The XrSpaceQueryInfoBaseHeaderFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceQueryInfoBaseHeaderFB {
    XrStructureType    type;
    const void*        next;
} XrSpaceQueryInfoBaseHeaderFB;
```

Member Descriptions

- type is the XrStructureType of this structure. This base structure itself has no associated XrStructureType value.
- next is NULL or a pointer to the next structure in a structure chain. This base structure itself has no associated XrStructureType value.

The XrSpaceQueryInfoBaseHeaderFB is a base structure that is not intended to be directly used, but forms a basis for specific query info types. All query info structures begin with the elements described

in the XrSpaceQueryInfoBaseHeaderFB, and a query info pointer **must** be cast to a pointer to XrSpaceQueryInfoBaseHeaderFB when passing it to the xrQuerySpacesFB function.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrSpaceQueryInfoBaseHeaderFB
- `type` **must** be `XR_TYPE_SPACE_QUERY_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpaceGroupUuidFilterInfoMETA

The XrSpaceFilterInfoBaseHeaderFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceFilterInfoBaseHeaderFB {
    XrStructureType    type;
    const void*        next;
} XrSpaceFilterInfoBaseHeaderFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. This base structure itself has no associated XrStructureType value.

The XrSpaceFilterInfoBaseHeaderFB is a base structure that is not intended to be directly used, but forms a basis for specific filter info types. All filter info structures begin with the elements described in the XrSpaceFilterInfoBaseHeaderFB, and a filter info pointer **must** be cast to a pointer to XrSpaceFilterInfoBaseHeaderFB when populating XrSpaceQueryInfoFB::`filter` and XrSpaceQueryInfoFB::`excludeFilter` to pass to the xrQuerySpacesFB function.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrSpaceFilterInfoBaseHeaderFB
- `type` **must** be one of the following XrStructureType values: `XR_TYPE_SPACE_COMPONENT_FILTER_INFO_FB`, `XR_TYPE_SPACE_UUID_FILTER_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpaceStorageLocationFilterInfoFB

The XrSpaceQueryInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceQueryInfoFB {
    XrStructureType                         type;
    const void*                             next;
    XrSpaceQueryActionFB                    queryAction;
    uint32_t                                maxResultCount;
    XrDuration                              timeout;
    const XrSpaceFilterInfoBaseHeaderFB*    filter;
    const XrSpaceFilterInfoBaseHeaderFB*    excludeFilter;
} XrSpaceQueryInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `queryAction` is the type of query to perform.
- `maxResultCount` is the maximum number of entities to be found.
- `timeout` is the number of nanoseconds before the operation should time out. A value of XR_INFINITE_DURATION indicates no timeout.
- `filter` is NULL or a pointer to a valid structure based on XrSpaceFilterInfoBaseHeaderFB.
- `excludeFilter` is NULL or a pointer to a valid structure based on XrSpaceFilterInfoBaseHeaderFB.

May be used to query for spaces and perform a specific action on the spaces returned. The available actions are enumerated in XrSpaceQueryActionFB. The filter info provided to the `filter` member of the struct is used as an inclusive filter. The filter info provided to the `excludeFilter` member of the structure is used to exclude spaces from the results returned from the filter. All spaces that match the criteria in `filter`, and that do not match the criteria in `excludeFilter`, **must** be included in the results returned. This is to allow for a more selective style query.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_query` extension **must** be enabled prior to using XrSpaceQueryInfoFB
- `type` **must** be `XR_TYPE_SPACE_QUERY_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `queryAction` **must** be a valid XrSpaceQueryActionFB value
- If `filter` is not `NULL`, `filter` **must** be a pointer to a valid XrSpaceFilterInfoBaseHeaderFB -based structure. See also: XrSpaceComponentFilterInfoFB, XrSpaceUuidFilterInfoFB
- If `excludeFilter` is not `NULL`, `excludeFilter` **must** be a pointer to a valid XrSpaceFilterInfoBaseHeaderFB-based structure. See also: XrSpaceComponentFilterInfoFB, XrSpaceUuidFilterInfoFB

The XrSpaceStorageLocationFilterInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceStorageLocationFilterInfoFB {
    XrStructureType             type;
    const void*                 next;
    XrSpaceStorageLocationFB    location;
} XrSpaceStorageLocationFilterInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `location` is the location to limit the query to.

Extends a query filter to limit a query to a specific storage location. Set the `next` pointer of an XrSpaceFilterInfoBaseHeaderFB to chain this extra filtering functionality.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrSpaceStorageLocationFilterInfoFB
- type **must** be XR_TYPE_SPACE_STORAGE_LOCATION_FILTER_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- location **must** be a valid XrSpaceStorageLocationFB value

The XrSpaceUuidFilterInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceUuidFilterInfoFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           uuidCount;
    XrUuidEXT*         uuids;
} XrSpaceUuidFilterInfoFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- uuidCount is the number of UUIDs to be matched.
- uuids is an array of XrUuidEXT that contains the UUIDs to be matched.

The XrSpaceUuidFilterInfoFB structure is a filter an application **can** use to find XrSpace entities that match specified UUIDs, to include or exclude them from a query.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrSpaceUuidFilterInfoFB
- type **must** be XR_TYPE_SPACE_UUID_FILTER_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- uuids **must** be a pointer to an array of uuidCount XrUuidEXT structures
- The uuidCount parameter **must** be greater than 0

The XrSpaceComponentFilterInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceComponentFilterInfoFB {
    XrStructureType           type;
    const void*               next;
    XrSpaceComponentTypeFB    componentType;
} XrSpaceComponentFilterInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `componentType` is the XrSpaceComponentTypeFB to query for.

The XrSpaceComponentFilterInfoFB structure is a filter an application **can** use to find XrSpace entities which have the `componentType` enabled, to include or exclude them from a query.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_query` extension **must** be enabled prior to using XrSpaceComponentFilterInfoFB
- `type` **must** be `XR_TYPE_SPACE_COMPONENT_FILTER_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `componentType` **must** be a valid XrSpaceComponentTypeFB value

The XrSpaceQueryResultFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceQueryResultFB {
    XrSpace      space;
    XrUuidEXT    uuid;
} XrSpaceQueryResultFB;
```

Member Descriptions

- `space` is the XrSpace handle to the spatial entity found by the query.
- `uuid` is the UUID that identifies the entity.

The XrSpaceQueryResultFB structure is a query result returned in the xrRetrieveSpaceQueryResultsFB::`results` output parameter of the xrRetrieveSpaceQueryResultsFB function.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_query` extension **must** be enabled prior to using XrSpaceQueryResultFB

The XrSpaceQueryResultsFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrSpaceQueryResultsFB {
    XrStructureType          type;
    void*                    next;
    uint32_t                 resultCapacityInput;
    uint32_t                 resultCountOutput;
    XrSpaceQueryResultFB*    results;
} XrSpaceQueryResultsFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `resultCapacityInput` is the capacity of the `results` array, or 0 to indicate a request to retrieve the required capacity.
- `resultCountOutput` is an output parameter containing the count of results retrieved, or returns the required capacity in the case that `resultCapacityInput` is insufficient.
- `results` is a pointer to an array of results, but **can** be `NULL` if `resultCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `results` size.

The XrSpaceQueryResultsFB structure is used by the xrRetrieveSpaceQueryResultsFB function to

retrieve query results.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrSpaceQueryResultsFB
- `type` **must** be `XR_TYPE_SPACE_QUERY_RESULTS_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `resultCapacityInput` is not `0`, `results` **must** be a pointer to an array of `resultCapacityInput` XrSpaceQueryResultFB structures

The XrEventDataSpaceQueryResultsAvailableFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrEventDataSpaceQueryResultsAvailableFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
} XrEventDataSpaceQueryResultsAvailableFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous query request.

It indicates a query request has produced some number of results. If a query yields results this event **must** be delivered before the XrEventDataSpaceQueryCompleteFB event is delivered. Call xrRetrieveSpaceQueryResultsFB to retrieve those results.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to using XrEventDataSpaceQueryResultsAvailableFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_QUERY_RESULTS_AVAILABLE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataSpaceQueryCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_query
typedef struct XrEventDataSpaceQueryCompleteFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpaceQueryCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous query request.
- `result` is an XrResult that determines if the request succeeded or if an error occurred.

It indicates a query request has completed and specifies the request result. This event **must** be delivered when a query has completed, regardless of the number of results found. If any results have been found, then this event **must** be delivered after any XrEventDataSpaceQueryResultsAvailableFB events have been delivered.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_query` extension **must** be enabled prior to using XrEventDataSpaceQueryCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_QUERY_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrQuerySpacesFB function is defined as:

```
// Provided by XR_FB_spatial_entity_query
XrResult xrQuerySpacesFB(
    XrSession                                   session,
    const XrSpaceQueryInfoBaseHeaderFB*         info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` is a pointer to the XrSpaceQueryInfoBaseHeaderFB structure.
- `requestId` is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The xrQuerySpacesFB function enables an application to find and retrieve spatial entities from storage. Cast an XrSpaceQueryInfoFB pointer to a XrSpaceQueryInfoBaseHeaderFB pointer to pass as `info`. The application **should** keep the returned `requestId` for the duration of the request as it is used to refer to the request when calling xrRetrieveSpaceQueryResultsFB and is used to map completion events to the request. This operation is asynchronous and the runtime **must** post an XrEventDataSpaceQueryCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted. The runtime **must** post an XrEventDataSpaceQueryResultsAvailableFB before XrEventDataSpaceQueryCompleteFB if any results are found. Once an XrEventDataSpaceQueryResultsAvailableFB event has been posted, the application **may** call xrRetrieveSpaceQueryResultsFB to retrieve the available results.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_query` extension **must** be enabled prior to calling xrQuerySpacesFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpaceQueryInfoBaseHeaderFB-based structure. See also: XrSpaceQueryInfoFB
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrRetrieveSpaceQueryResultsFB function is defined as:

```
// Provided by XR_FB_spatial_entity_query
XrResult xrRetrieveSpaceQueryResultsFB(
    XrSession                                   session,
    XrAsyncRequestIdFB                          requestId,
    XrSpaceQueryResultsFB*                      results);
```

Parameter Descriptions

- session is the XrSession for which the in-progress query is valid.
- requestId is the XrAsyncRequestIdFB to enumerate results for.
- results is a pointer to an XrSpaceQueryResultsFB to populate with results.
- See the Buffer Size Parameters section for a detailed description of retrieving the required size of the results in this parameter.

Allows an application to retrieve all available results for a specified query. Call this function once to get the number of results found and then once more to copy the results into a buffer provided by the application. The number of results will not change between the two calls used to retrieve results. This function **must** only retrieve each query result once. After the application has used this function to retrieve a query result, the runtime frees its copy. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if requestId refers to a request that is not yet complete, a request for which results have already been retrieved, or if requestId does not refer to a known request.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_query extension **must** be enabled prior to calling xrRetrieveSpaceQueryResultsFB
- `session` **must** be a valid XrSession handle
- `results` **must** be a pointer to an XrSpaceQueryResultsFB structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED

Overview

This extension enables spatial entities to be shared between users. If the XR_SPACE_COMPONENT_TYPE_SHARABLE_FB component has been enabled on the spatial entity, application developers **may** share XrSpace entities between users.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SPACE_SHARE_INFO_FB
- XR_TYPE_EVENT_DATA_SPACE_SHARE_COMPLETE_FB

XrResult enumeration is extended with:

- XR_ERROR_SPACE_MAPPING_INSUFFICIENT_FB
- XR_ERROR_SPACE_LOCALIZATION_FAILED_FB
- XR_ERROR_SPACE_NETWORK_TIMEOUT_FB
- XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB
- XR_ERROR_SPACE_CLOUD_STORAGE_DISABLED_FB

New Enums

New Base Types

New Structures

The XrSpaceShareInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_sharing
typedef struct XrSpaceShareInfoFB {
    XrStructureType    type;
    const void*        next;
    uint32_t           spaceCount;
    XrSpace*           spaces;
    uint32_t           userCount;
    XrSpaceUserFB*     users;
} XrSpaceShareInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. `spaceCount` is the number of elements in the `spaces` list. `spaces` is a list containing all spatial entities to be shared. `userCount` is the number of elements in the `users` list. `users` is a list of the users with which the `spaces` will: be shared.

The XrSpaceShareInfoFB structure describes a request to share one or more spatial entities with one or more users.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_sharing` extension **must** be enabled prior to using XrSpaceShareInfoFB
- `type` **must** be `XR_TYPE_SPACE_SHARE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `spaces` **must** be a pointer to an array of `spaceCount` XrSpace handles
- `users` **must** be a pointer to an array of `userCount` XrSpaceUserFB handles
- The `spaceCount` parameter **must** be greater than `0`
- The `userCount` parameter **must** be greater than `0`

The XrEventDataSpaceShareCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_sharing
typedef struct XrEventDataSpaceShareCompleteFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpaceShareCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request used to share the spatial entities.
- `result` is an XrResult that describes whether the request succeeded or if an error occurred.

It indicates that the request to share one or more spatial entities has completed. The application **can** use `result` to check if the request was successful or if an error occurred.

Result Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPACE_MAPPING_INSUFFICIENT_FB`
- `XR_ERROR_SPACE_LOCALIZATION_FAILED_FB`
- `XR_ERROR_SPACE_NETWORK_TIMEOUT_FB`
- `XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB`
- `XR_ERROR_SPACE_CLOUD_STORAGE_DISABLED_FB`

Valid Usage (Implicit)

- The XR_FB_spatial_entity_sharing extension **must** be enabled prior to using XrEventDataSpaceShareCompleteFB
- type **must** be XR_TYPE_EVENT_DATA_SPACE_SHARE_COMPLETE_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

New Functions

The xrShareSpacesFB function is defined as:

```
// Provided by XR_FB_spatial_entity_sharing
XrResult xrShareSpacesFB(
    XrSession                                   session,
    const XrSpaceShareInfoFB*                   info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- session is a handle to an XrSession.
- info is a pointer to an XrSpaceShareInfoFB structure containing information about which spatial entities to share with which users.
- requestId is the output parameter that points to the ID of this asynchronous request.

This operation is asynchronous and the runtime **must** post an XrEventDataSpaceShareCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted. The requestId **can** be used to later refer to the request, such as identifying which request has completed when an XrEventDataSpaceShareCompleteFB is posted to the event queue.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_sharing extension **must** be enabled prior to calling xrShareSpacesFB
- session **must** be a valid XrSession handle
- info **must** be a pointer to a valid XrSpaceShareInfoFB structure
- requestId **must** be a pointer to an XrAsyncRequestIdFB value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_CLOUD_STORAGE_DISABLED_FB
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_SPACE_LOCALIZATION_FAILED_FB
- XR_ERROR_SPACE_MAPPING_INSUFFICIENT_FB
- XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB
- XR_ERROR_SPACE_NETWORK_TIMEOUT_FB
- XR_ERROR_VALIDATION_FAILURE

Overview

This extension enables spatial entities to be stored and persisted across sessions. If the XR_SPACE_COMPONENT_TYPE_STORABLE_FB component has been enabled on the spatial entity, application developers **may** save, load, and erase persisted XrSpace entities.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SPACE_SAVE_INFO_FB
- XR_TYPE_SPACE_ERASE_INFO_FB
- XR_TYPE_EVENT_DATA_SPACE_SAVE_COMPLETE_FB
- XR_TYPE_EVENT_DATA_SPACE_ERASE_COMPLETE_FB

New Enums

```
// Provided by XR_FB_spatial_entity_storage
typedef enum XrSpaceStorageLocationFB {
    XR_SPACE_STORAGE_LOCATION_INVALID_FB = 0,
    XR_SPACE_STORAGE_LOCATION_LOCAL_FB = 1,
    XR_SPACE_STORAGE_LOCATION_CLOUD_FB = 2,
    XR_SPACE_STORAGE_LOCATION_MAX_ENUM_FB = 0x7FFFFFFF
} XrSpaceStorageLocationFB;
```

The XrSpaceStorageLocationFB enumeration contains the storage locations used to store, erase, and query spatial entities.

Enumerant Descriptions

- XR_SPACE_STORAGE_LOCATION_INVALID_FB — Invalid storage location
- XR_SPACE_STORAGE_LOCATION_LOCAL_FB — Local device storage
- XR_SPACE_STORAGE_LOCATION_CLOUD_FB — Cloud storage

```
// Provided by XR_FB_spatial_entity_storage
typedef enum XrSpacePersistenceModeFB {
    XR_SPACE_PERSISTENCE_MODE_INVALID_FB = 0,
    XR_SPACE_PERSISTENCE_MODE_INDEFINITE_FB = 1,
    XR_SPACE_PERSISTENCE_MODE_MAX_ENUM_FB = 0x7FFFFFFF
} XrSpacePersistenceModeFB;
```

The XrSpacePersistenceModeFB enumeration specifies the persistence mode for the save operation.

Enumerant Descriptions

- XR_SPACE_PERSISTENCE_MODE_INVALID_FB — Invalid storage persistence
- XR_SPACE_PERSISTENCE_MODE_INDEFINITE_FB — Store XrSpace indefinitely, or until erased

New Structures

The XrSpaceSaveInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage
typedef struct XrSpaceSaveInfoFB {
    XrStructureType             type;
    const void*                 next;
    XrSpace                     space;
    XrSpaceStorageLocationFB    location;
    XrSpacePersistenceModeFB    persistenceMode;
} XrSpaceSaveInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is the XrSpace handle to the space of the entity to be saved.
- `location` is the storage location.
- `persistenceMode` is the persistence mode.

The XrSpaceSaveInfoFB structure contains information used to save the spatial entity.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage` extension **must** be enabled prior to using XrSpaceSaveInfoFB
- `type` **must** be `XR_TYPE_SPACE_SAVE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle
- `location` **must** be a valid XrSpaceStorageLocationFB value
- `persistenceMode` **must** be a valid XrSpacePersistenceModeFB value

The XrSpaceEraseInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage
typedef struct XrSpaceEraseInfoFB {
    XrStructureType             type;
    const void*                 next;
    XrSpace                     space;
    XrSpaceStorageLocationFB    location;
} XrSpaceEraseInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is the XrSpace handle to the reference space that defines the entity to be erased.
- `location` is the storage location.

The XrSpaceEraseInfoFB structure contains information used to erase the spatial entity.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage` extension **must** be enabled prior to using XrSpaceEraseInfoFB
- `type` **must** be `XR_TYPE_SPACE_ERASE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle
- `location` **must** be a valid XrSpaceStorageLocationFB value

The XrEventDataSpaceSaveCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage
typedef struct XrEventDataSpaceSaveCompleteFB {
    XrStructureType             type;
    const void*                 next;
    XrAsyncRequestIdFB          requestId;
    XrResult                    result;
    XrSpace                     space;
    XrUuidEXT                   uuid;
    XrSpaceStorageLocationFB    location;
} XrEventDataSpaceSaveCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request to save an entity.
- `result` is an XrResult that describes whether the request succeeded or if an error occurred.
- `space` is the spatial entity being saved.
- `uuid` is the UUID for the spatial entity being saved.
- `location` is the location of the spatial entity being saved.

The save result event contains the success of the save/write operation to the specified location, as well as the XrSpace handle on which the save operation was attempted on, the unique UUID, and the triggered async request ID from the initial calling function.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage` extension **must** be enabled prior to using XrEventDataSpaceSaveCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_SAVE_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataSpaceEraseCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage
typedef struct XrEventDataSpaceEraseCompleteFB {
    XrStructureType             type;
    const void*                 next;
    XrAsyncRequestIdFB          requestId;
    XrResult                    result;
    XrSpace                     space;
    XrUuidEXT                   uuid;
    XrSpaceStorageLocationFB    location;
} XrEventDataSpaceEraseCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request to erase an entity.
- `result` is an XrResult that describes whether the request succeeded or if an error occurred.
- `space` is the spatial entity being erased.
- `uuid` is the UUID for the spatial entity being erased.
- `location` is the location of the spatial entity being erased.

The erase result event contains the success of the erase operation from the specified storage location. It also provides the UUID of the entity and the async request ID from the initial calling function.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage` extension **must** be enabled prior to using XrEventDataSpaceEraseCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_ERASE_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrSaveSpaceFB function is defined as:

```
// Provided by XR_FB_spatial_entity_storage
XrResult xrSaveSpaceFB(
    XrSession                                   session,
    const XrSpaceSaveInfoFB*                    info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the parameters for the save operation.
- `requestId` is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The xrSaveSpaceFB function persists the spatial entity at the specified location with the specified mode. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if XrSpaceSaveInfoFB::space is XR_NULL_HANDLE or otherwise invalid. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if XrSpaceSaveInfoFB::location or XrSpaceSaveInfoFB::persistenceMode is invalid. This operation is asynchronous and the runtime **must** post an XrEventDataSpaceSaveCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted.

Valid Usage (Implicit)

- The XR_FB_spatial_entity_storage extension **must** be enabled prior to calling xrSaveSpaceFB
- session **must** be a valid XrSession handle
- info **must** be a pointer to a valid XrSpaceSaveInfoFB structure
- requestId **must** be a pointer to an XrAsyncRequestIdFB value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The xrEraseSpaceFB function is defined as:

```
// Provided by XR_FB_spatial_entity_storage
XrResult xrEraseSpaceFB(
    XrSession                                   session,
    const XrSpaceEraseInfoFB*                   info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the parameters for the erase operation.
- `requestId` is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The xrEraseSpaceFB function erases a spatial entity from storage at the specified location. The XrSpace remains valid in the current session until the application destroys it or the session ends. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if XrSpaceEraseInfoFB::`space` is XR_NULL_HANDLE or otherwise invalid. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if XrSpaceEraseInfoFB ::`location` is invalid. This operation is asynchronous and the runtime **must** post an XrEventDataSpaceEraseCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage` extension **must** be enabled prior to calling xrEraseSpaceFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpaceEraseInfoFB structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`
- `XR_ERROR_VALIDATION_FAILURE`

Overview

This extension enables multiple spatial entities at a time to be persisted across sessions. If the XR_SPACE_COMPONENT_TYPE_STORABLE_FB component has been enabled on the spatial entity, application developers **may** save and erase XrSpace entities.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SPACE_LIST_SAVE_INFO_FB
- XR_TYPE_EVENT_DATA_SPACE_LIST_SAVE_COMPLETE_FB

New Enums

New Structures

The XrSpaceListSaveInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage_batch
typedef struct XrSpaceListSaveInfoFB {
    XrStructureType             type;
    const void*                 next;
    uint32_t                    spaceCount;
    XrSpace*                    spaces;
    XrSpaceStorageLocationFB    location;
} XrSpaceListSaveInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `spaceCount` is the number of spatial entities to save.
- `spaces` is a list of XrSpace handles for the entities to be saved.
- `location` is the storage location.

The XrSpaceListSaveInfoFB structure contains information used to save multiple spatial entities.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage_batch` extension **must** be enabled prior to using XrSpaceListSaveInfoFB
- `type` **must** be `XR_TYPE_SPACE_LIST_SAVE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `spaces` **must** be a pointer to an array of `spaceCount` XrSpace handles
- `location` **must** be a valid XrSpaceStorageLocationFB value
- The `spaceCount` parameter **must** be greater than `0`

The XrEventDataSpaceListSaveCompleteFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_storage_batch
typedef struct XrEventDataSpaceListSaveCompleteFB {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpaceListSaveCompleteFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the ID of the asynchronous request to save an entity.
- `result` is an XrResult that describes whether the request succeeded or if an error occurred.

This completion event indicates that a request to save a list of XrSpace objects has completed. The application **can** use `result` to check if the request was successful or if an error occurred.

Result Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPACE_MAPPING_INSUFFICIENT_FB`
- `XR_ERROR_SPACE_LOCALIZATION_FAILED_FB`
- `XR_ERROR_SPACE_NETWORK_TIMEOUT_FB`
- `XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB`
- `XR_ERROR_SPACE_CLOUD_STORAGE_DISABLED_FB`

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage_batch` extension **must** be enabled prior to using XrEventDataSpaceListSaveCompleteFB
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACE_LIST_SAVE_COMPLETE_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrSaveSpaceListFB function is defined as:

```
// Provided by XR_FB_spatial_entity_storage_batch
XrResult xrSaveSpaceListFB(
    XrSession                                   session,
    const XrSpaceListSaveInfoFB*                info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the parameters for the save operation.
- `requestId` is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The xrSaveSpaceListFB function persists the specified spatial entities at the specified storage location. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if XrSpaceSaveInfoFB::`location` is invalid. This operation is asynchronous and the runtime **must** post an XrEventDataSpaceListSaveCompleteFB event when the operation completes successfully or encounters an error. If this function returns a failure code, no event is posted.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_storage_batch` extension **must** be enabled prior to calling xrSaveSpaceListFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpaceListSaveInfoFB structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_CLOUD_STORAGE_DISABLED_FB
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_SPACE_LOCALIZATION_FAILED_FB
- XR_ERROR_SPACE_MAPPING_INSUFFICIENT_FB
- XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB
- XR_ERROR_SPACE_NETWORK_TIMEOUT_FB
- XR_ERROR_VALIDATION_FAILURE

Overview

This extension enables creation and management of user objects which **can** be used by the application to reference a user other than the current user.

New Object Types

```
// Provided by XR_FB_spatial_entity_user
XR_DEFINE_HANDLE(XrSpaceUserFB)
```

Represents a user with which the application **can** interact using various extensions including `XR_FB_spatial_entity_sharing`. See xrCreateSpaceUserFB for how to declare a user.

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SPACE_USER_CREATE_INFO_FB`

New Enums

New Base Types

The `XrSpaceUserIdFB` type is defined as:

```
// Provided by XR_FB_spatial_entity_user
typedef uint64_t XrSpaceUserIdFB;
```

An implementation-defined ID of the underlying user.

New Structures

The XrSpaceUserCreateInfoFB structure is defined as:

```
// Provided by XR_FB_spatial_entity_user
typedef struct XrSpaceUserCreateInfoFB {
    XrStructureType    type;
    const void*        next;
    XrSpaceUserIdFB    userId;
} XrSpaceUserCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `userId` is the user ID with which the application can reference.

The XrSpaceUserCreateInfoFB structure describes a user with which the application **can** interact.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_user` extension **must** be enabled prior to using XrSpaceUserCreateInfoFB
- `type` **must** be `XR_TYPE_SPACE_USER_CREATE_INFO_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrCreateSpaceUserFB function is defined as:

```
// Provided by XR_FB_spatial_entity_user
XrResult xrCreateSpaceUserFB(
    XrSession                                   session,
    const XrSpaceUserCreateInfoFB*              info,
    XrSpaceUserFB*                              user);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` is a pointer to an XrSpaceUserCreateInfoFB structure containing information to create the user handle.
- `user` is the output parameter that points to the handle of the user being created.

The application **can** use this function to create a user handle with which it **can** then interact, such as sharing XrSpace objects.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_user` extension **must** be enabled prior to calling xrCreateSpaceUserFB
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpaceUserCreateInfoFB structure
- `user` **must** be a pointer to an XrSpaceUserFB handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrGetSpaceUserIdFB function is defined as:

```
// Provided by XR_FB_spatial_entity_user
XrResult xrGetSpaceUserIdFB(
    XrSpaceUserFB                               user,
    XrSpaceUserIdFB*                            userId);
```

Parameter Descriptions

- `user` is a handle to an XrSpaceUserFB.
- `userId` is the output parameter that points to the user ID of the user.

The application **can** use this function to retrieve the user ID of a given user handle.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_user` extension **must** be enabled prior to calling xrGetSpaceUserIdFB
- `user` **must** be a valid XrSpaceUserFB handle
- `userId` **must** be a pointer to an `XrSpaceUserIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrDestroySpaceUserFB function is defined as:

```
// Provided by XR_FB_spatial_entity_user
XrResult xrDestroySpaceUserFB(
    XrSpaceUserFB                               user);
```

Parameter Descriptions

- `user` is a handle to the user object to be destroyed.

The application **should** use this function to release resources tied to a given XrSpaceUserFB once the application no longer needs to reference the user.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity_user` extension **must** be enabled prior to calling xrDestroySpaceUserFB
- `user` **must** be a valid XrSpaceUserFB handle

Thread Safety

- Access to `user`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

Issues

Overview

This extension enables the application to modify and query specific mutable state associated with a swapchain.

New Object Types

New Flag Types

New Enum Constants

New Enums

New Structures

The XrSwapchainStateBaseHeaderFB structure is defined as:

```
// Provided by XR_FB_swapchain_update_state
typedef struct XrSwapchainStateBaseHeaderFB {
    XrStructureType    type;
    void*              next;
} XrSwapchainStateBaseHeaderFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure. This base structure itself has no associated XrStructureType value.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrSwapchainStateBaseHeaderFB is a base structure that can be overridden by a specific `XrSwapchainState*` child structure.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state` extension **must** be enabled prior to using XrSwapchainStateBaseHeaderFB
- `type` **must** be one of the following XrStructureType values: `XR_TYPE_SWAPCHAIN_STATE_ANDROID_SURFACE_DIMENSIONS_FB`, `XR_TYPE_SWAPCHAIN_STATE_FOVEATION_FB`, `XR_TYPE_SWAPCHAIN_STATE_SAMPLER_OPENGL_ES_FB`, `XR_TYPE_SWAPCHAIN_STATE_SAMPLER_VULKAN_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrUpdateSwapchainFB function is defined as:

```
// Provided by XR_FB_swapchain_update_state
XrResult xrUpdateSwapchainFB(
    XrSwapchain                                 swapchain,
    const XrSwapchainStateBaseHeaderFB*         state);
```

Parameter Descriptions

- `swapchain` is the XrSwapchain to update state for.
- `state` is a pointer to a `XrSwapchainState` structure based off of XrSwapchainStateBaseHeaderFB.

xrUpdateSwapchainFB provides support for an application to update specific mutable state associated with an XrSwapchain.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state` extension **must** be enabled prior to calling xrUpdateSwapchainFB
- `swapchain` **must** be a valid XrSwapchain handle
- `state` **must** be a pointer to a valid XrSwapchainStateBaseHeaderFB-based structure. See also: XrSwapchainStateAndroidSurfaceDimensionsFB, XrSwapchainStateFoveationFB, XrSwapchainStateSamplerOpenGLESFB, XrSwapchainStateSamplerVulkanFB

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrGetSwapchainStateFB function is defined as:

```
// Provided by XR_FB_swapchain_update_state
XrResult xrGetSwapchainStateFB(
    XrSwapchain                                 swapchain,
    XrSwapchainStateBaseHeaderFB*               state);
```

Parameter Descriptions

- `swapchain` is the XrSwapchain to update state for.
- `state` is a pointer to a `XrSwapchainState` structure based off of XrSwapchainStateBaseHeaderFB.

xrGetSwapchainStateFB provides support for an application to query specific mutable state associated with an XrSwapchain.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state` extension **must** be enabled prior to calling xrGetSwapchainStateFB
- `swapchain` **must** be a valid XrSwapchain handle
- `state` **must** be a pointer to an XrSwapchainStateBaseHeaderFB-based structure. See also: XrSwapchainStateAndroidSurfaceDimensionsFB, XrSwapchainStateFoveationFB, XrSwapchainStateSamplerOpenGLESFB, XrSwapchainStateSamplerVulkanFB

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

- Should we add a method to query the current state?
  - Yes. Given that we allow mutable state to be updated by the application, it is useful to have a query mechanism to get the current state for all state structures.

Version History

- Revision 1, 2021-04-16 (Gloria Kennickell)
  - Initial extension description
- Revision 2, 2021-05-13 (Gloria Kennickell)
  - Add mechanism to query current state for all state structures.
- Revision 3, 2021-05-27 (Gloria Kennickell)
  - Move platform and graphics API specific structs into separate extensions.

12.129. XR_FB_swapchain_update_state_android_surface

Overview

This extension enables the application to modify and query specific mutable state associated with an Android surface swapchain, examples include:

- A video application may need to update the default size of the image buffers associated with an Android Surface Swapchain.
- A video application may need to communicate a new width and height for an Android Surface Swapchain, as the surface dimensions may be implicitly updated by the producer during the life of the Swapchain. This is important for correct application of the non-normalized `imageRect` specified via XrSwapchainSubImage.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SWAPCHAIN_STATE_ANDROID_SURFACE_DIMENSIONS_FB`

New Enums

New Structures

The XrSwapchainStateAndroidSurfaceDimensionsFB structure is defined as:

```
// Provided by XR_FB_swapchain_update_state_android_surface
typedef struct XrSwapchainStateAndroidSurfaceDimensionsFB {
    XrStructureType    type;
    void*              next;
    uint32_t           width;
    uint32_t           height;
} XrSwapchainStateAndroidSurfaceDimensionsFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `width` is the width of the image buffer, must not be greater than the graphics API's maximum limit.
- `height` is the height of the image buffer, must not be greater than the graphics API's maximum limit.

When XrSwapchainStateAndroidSurfaceDimensionsFB is specified in the call to xrUpdateSwapchainFB, the dimensions provided will be used to update the default size of the image buffers associated with the Android Surface swapchain.

Additionally, the dimensions provided will become the new source of truth for the swapchain width and height, affecting operations such as computing the normalized imageRect for the swapchain.

When XrSwapchainStateAndroidSurfaceDimensionsFB is specified in the call to xrGetSwapchainStateFB, the dimensions will be populated with the current swapchain width and height.

To use XrSwapchainStateAndroidSurfaceDimensionsFB, XR_USE_PLATFORM_ANDROID must be defined before including `openxr_platform.h`.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state_android_surface` extension **must** be enabled prior to using XrSwapchainStateAndroidSurfaceDimensionsFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_STATE_ANDROID_SURFACE_DIMENSIONS_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

This extension enables the application to modify and query OpenGL ES-specific mutable state associated with a swapchain, examples include:

- On platforms where composition runs in a separate process from the application, swapchains must be created in a cross-process friendly way. In such cases, the texture image memory may be shared between processes, but the texture state may not; and, an explicit mechanism to synchronize this texture state between the application and the compositor is required.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SWAPCHAIN_STATE_SAMPLER_OPENGL_ES_FB

New Enums

New Structures

The XrSwapchainStateSamplerOpenGLESFB structure is defined as:

```
// Provided by XR_FB_swapchain_update_state_opengl_es
typedef struct XrSwapchainStateSamplerOpenGLESFB {
    XrStructureType    type;
    void*              next;
    EGLenum            minFilter;
    EGLenum            magFilter;
    EGLenum            wrapModeS;
    EGLenum            wrapModeT;
    EGLenum            swizzleRed;
    EGLenum            swizzleGreen;
    EGLenum            swizzleBlue;
    EGLenum            swizzleAlpha;
    float              maxAnisotropy;
    XrColor4f          borderColor;
} XrSwapchainStateSamplerOpenGLESFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `minFilter` is a valid Android OpenGL ES `EGLenum`.
- `magFilter` is a valid Android OpenGL ES `EGLenum`.
- `wrapModeS` is a valid Android OpenGL ES `EGLenum`.
- `wrapModeT` is a valid Android OpenGL ES `EGLenum`.
- `swizzleRed` is a valid Android OpenGL ES `EGLenum`.
- `swizzleGreen` is a valid Android OpenGL ES `EGLenum`.
- `swizzleBlue` is a valid Android OpenGL ES `EGLenum`.
- `swizzleAlpha` is a valid Android OpenGL ES `EGLenum`.
- `maxAnisotropy` is a valid float used to represent max anisotropy.
- `borderColor` is an RGBA color to be used as border texels.

When XrSwapchainStateSamplerOpenGLESFB is specified in the call to xrUpdateSwapchainFB, texture sampler state for all images in the XrSwapchain will be updated for both the application and

compositor processes.

For most cases, the sampler state update is only required compositor-side, as that is where the swapchain images are sampled. For completeness, the application-side sampler state is additionally updated to support cases where the application may choose to directly sample the swapchain images.

Applications are expected to handle synchronization of the sampler state update with application-side rendering. Similarly, the compositor will synchronize the sampler state update with rendering of the next compositor frame.

An `EGLContext`, either the `EGLContext` bound during XrSwapchain creation or an `EGLContext` in the same share group, is required to be bound on the application calling thread. Current texture bindings may be altered by the call, including the active texture.

When XrSwapchainStateSamplerOpenGLESFB is specified in the call to xrGetSwapchainStateFB, the sampler state will be populated with the current swapchain sampler state.

To use XrSwapchainStateSamplerOpenGLESFB, XR_USE_GRAPHICS_API_OPENGL_ES must be defined before including `openxr_platform.h`.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state_opengl_es` extension **must** be enabled prior to using XrSwapchainStateSamplerOpenGLESFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_STATE_SAMPLER_OPENGL_ES_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `minFilter` **must** be a valid `EGLenum` value
- `magFilter` **must** be a valid `EGLenum` value
- `wrapModeS` **must** be a valid `EGLenum` value
- `wrapModeT` **must** be a valid `EGLenum` value
- `swizzleRed` **must** be a valid `EGLenum` value
- `swizzleGreen` **must** be a valid `EGLenum` value
- `swizzleBlue` **must** be a valid `EGLenum` value
- `swizzleAlpha` **must** be a valid `EGLenum` value

Overview

This extension enables the application to modify and query Vulkan-specific mutable state associated with a swapchain, examples include:

- On platforms where composition runs in a separate process from the application, swapchains must be created in a cross-process friendly way. In such cases, the texture image memory may be shared between processes, but the texture state may not; and, an explicit mechanism to synchronize this texture state between the application and the compositor is required.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SWAPCHAIN_STATE_SAMPLER_VULKAN_FB

New Enums

New Structures

The XrSwapchainStateSamplerVulkanFB structure is defined as:

```
// Provided by XR_FB_swapchain_update_state_vulkan
typedef struct XrSwapchainStateSamplerVulkanFB {
    XrStructureType         type;
    void*                   next;
    VkFilter                minFilter;
    VkFilter                magFilter;
    VkSamplerMipmapMode     mipmapMode;
    VkSamplerAddressMode    wrapModeS;
    VkSamplerAddressMode    wrapModeT;
    VkComponentSwizzle      swizzleRed;
    VkComponentSwizzle      swizzleGreen;
    VkComponentSwizzle      swizzleBlue;
    VkComponentSwizzle      swizzleAlpha;
    float                   maxAnisotropy;
    XrColor4f               borderColor;
} XrSwapchainStateSamplerVulkanFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `minFilter` is a valid Vulkan `VkFilter`.
- `magFilter` is a valid Vulkan `VkFilter`.
- `mipmapMode` is a valid Vulkan `VkSamplerMipmapMode`.
- `wrapModeS` is a valid Vulkan `VkSamplerAddressMode`.
- `wrapModeT` is a valid Vulkan `VkSamplerAddressMode`.
- `swizzleRed` is a valid Vulkan `VkComponentSwizzle`.
- `swizzleGreen` is a valid Vulkan `VkComponentSwizzle`.
- `swizzleBlue` is a valid Vulkan `VkComponentSwizzle`.
- `swizzleAlpha` is a valid Vulkan `VkComponentSwizzle`.
- `maxAnisotropy` is a valid float used to represent max anisotropy.
- `borderColor` is an RGBA color to be used as border texels.

When XrSwapchainStateSamplerVulkanFB is specified in the call to xrUpdateSwapchainFB, texture sampler state for all images in the XrSwapchain will be updated for the compositor process. For most cases, the sampler state update is only required compositor-side, as that is where the swapchain images are sampled. If the application requires sampling of the swapchain images, the application will be responsible for updating the texture state using normal Vulkan mechanisms and synchronizing appropriately with application-side rendering.

When XrSwapchainStateSamplerVulkanFB is specified in the call to xrGetSwapchainStateFB, the sampler state will be populated with the current swapchain sampler state.

To use XrSwapchainStateSamplerVulkanFB, XR_USE_GRAPHICS_API_VULKAN must be defined before including `openxr_platform.h`.

Valid Usage (Implicit)

- The `XR_FB_swapchain_update_state_vulkan` extension **must** be enabled prior to using XrSwapchainStateSamplerVulkanFB
- `type` **must** be `XR_TYPE_SWAPCHAIN_STATE_SAMPLER_VULKAN_FB`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `minFilter` **must** be a valid `VkFilter` value
- `magFilter` **must** be a valid `VkFilter` value
- `mipmapMode` **must** be a valid `VkSamplerMipmapMode` value
- `wrapModeS` **must** be a valid `VkSamplerAddressMode` value
- `wrapModeT` **must** be a valid `VkSamplerAddressMode` value
- `swizzleRed` **must** be a valid `VkComponentSwizzle` value
- `swizzleGreen` **must** be a valid `VkComponentSwizzle` value
- `swizzleBlue` **must** be a valid `VkComponentSwizzle` value
- `swizzleAlpha` **must** be a valid `VkComponentSwizzle` value

Overview

Meshes may be useful in XR applications when representing parts of the environment. In particular, application may provide the surfaces of real-world objects tagged manually to the runtime, or obtain automatically detected environment contents.

This extension allows:

- An application to create a triangle mesh and specify the mesh data.
- An application to update mesh contents if a mesh is mutable.

New Object Types

```
// Provided by XR_FB_triangle_mesh
XR_DEFINE_HANDLE(XrTriangleMeshFB)
```

XrTriangleMeshFB represents a triangle mesh with its corresponding mesh data: a vertex buffer and an index buffer.

New Flag Types

```
// Provided by XR_FB_triangle_mesh
typedef XrFlags64 XrTriangleMeshFlagsFB;
```

```
// Provided by XR_FB_triangle_mesh
// Flag bits for XrTriangleMeshFlagsFB
static const XrTriangleMeshFlagsFB XR_TRIANGLE_MESH_MUTABLE_BIT_FB = 0x00000001;
```

Flag Descriptions

- XR_TRIANGLE_MESH_MUTABLE_BIT_FB — The triangle mesh is mutable (can be modified after it is created).

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_TRIANGLE_MESH_CREATE_INFO_FB

New Enums

Applications may specify the triangle winding order of a mesh - whether the vertices of an outward-facing side of a triangle appear in clockwise or counter-clockwise order - using XrWindingOrderFB enumeration.

```
// Provided by XR_FB_triangle_mesh
typedef enum XrWindingOrderFB {
    XR_WINDING_ORDER_UNKNOWN_FB = 0,
    XR_WINDING_ORDER_CW_FB = 1,
    XR_WINDING_ORDER_CCW_FB = 2,
    XR_WINDING_ORDER_MAX_ENUM_FB = 0x7FFFFFFF
} XrWindingOrderFB;
```

Enumerant Descriptions

- XR_WINDING_ORDER_UNKNOWN_FB — Winding order is unknown and the runtime cannot make any assumptions on the triangle orientation
- XR_WINDING_ORDER_CW_FB — Clockwise winding order
- XR_WINDING_ORDER_CCW_FB — Counter-clockwise winding order

New Structures

XrTriangleMeshCreateInfoFB **must** be provided when calling xrCreateTriangleMeshFB.

The XrTriangleMeshCreateInfoFB structure is defined as:

```
// Provided by XR_FB_triangle_mesh
typedef struct XrTriangleMeshCreateInfoFB {
    XrStructureType          type;
    const void*              next;
    XrTriangleMeshFlagsFB    flags;
    XrWindingOrderFB         windingOrder;
    uint32_t                 vertexCount;
    const XrVector3f*        vertexBuffer;
    uint32_t                 triangleCount;
    const uint32_t*          indexBuffer;
} XrTriangleMeshCreateInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrTriangleMeshFlagBitsFB that specify behavior.
- `windingOrder` is the XrWindingOrderFB value defining the winding order of the mesh triangles.
- `vertexCount` is the number of vertices in the mesh. In the case of the mutable mesh, the value is treated as the maximum number of vertices the mesh will be able to represent at any time in its lifecycle. The actual number of vertices can vary and is defined when xrTriangleMeshEndUpdateFB is called.
- `vertexBuffer` is a pointer to the vertex data. The size of the array must be `vertexCount` elements. When the mesh is mutable (`(flags & XR_TRIANGLE_MESH_MUTABLE_BIT_FB) != 0`), the `vertexBuffer` parameter **must** be `NULL` and mesh data **must** be populated separately.
- `triangleCount` is the number of triangles in the mesh. In the case of the mutable mesh, the value is treated as the maximum number of triangles the mesh will be able to represent at any time in its lifecycle. The actual number of triangles can vary and is defined when xrTriangleMeshEndUpdateFB is called.
- `indexBuffer` the triangle indices. The size of the array must be `triangleCount` elements. When the mesh is mutable (`(flags & XR_TRIANGLE_MESH_MUTABLE_BIT_FB) != 0`), the `indexBuffer` parameter **must** be `NULL` and mesh data **must** be populated separately.

Mesh buffers **can** be updated between xrTriangleMeshBeginUpdateFB and xrTriangleMeshEndUpdateFB calls.

If the mesh is non-mutable, `vertexBuffer` **must** be a pointer to an array of `vertexCount` XrVector3f structures. If the mesh is non-mutable, `indexBuffer` **must** be a pointer to an array of 3 * `triangleCount`

uint32_t vertex indices.

Valid Usage (Implicit)

- The XR_FB_triangle_mesh extension **must** be enabled prior to using XrTriangleMeshCreateInfoFB
- type **must** be XR_TYPE_TRIANGLE_MESH_CREATE_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- flags **must** be 0 or a valid combination of XrTriangleMeshFlagBitsFB values
- windingOrder **must** be a valid XrWindingOrderFB value

Mutable Mesh Update States

Mutable meshes have a state machine controlling how they may be updated.

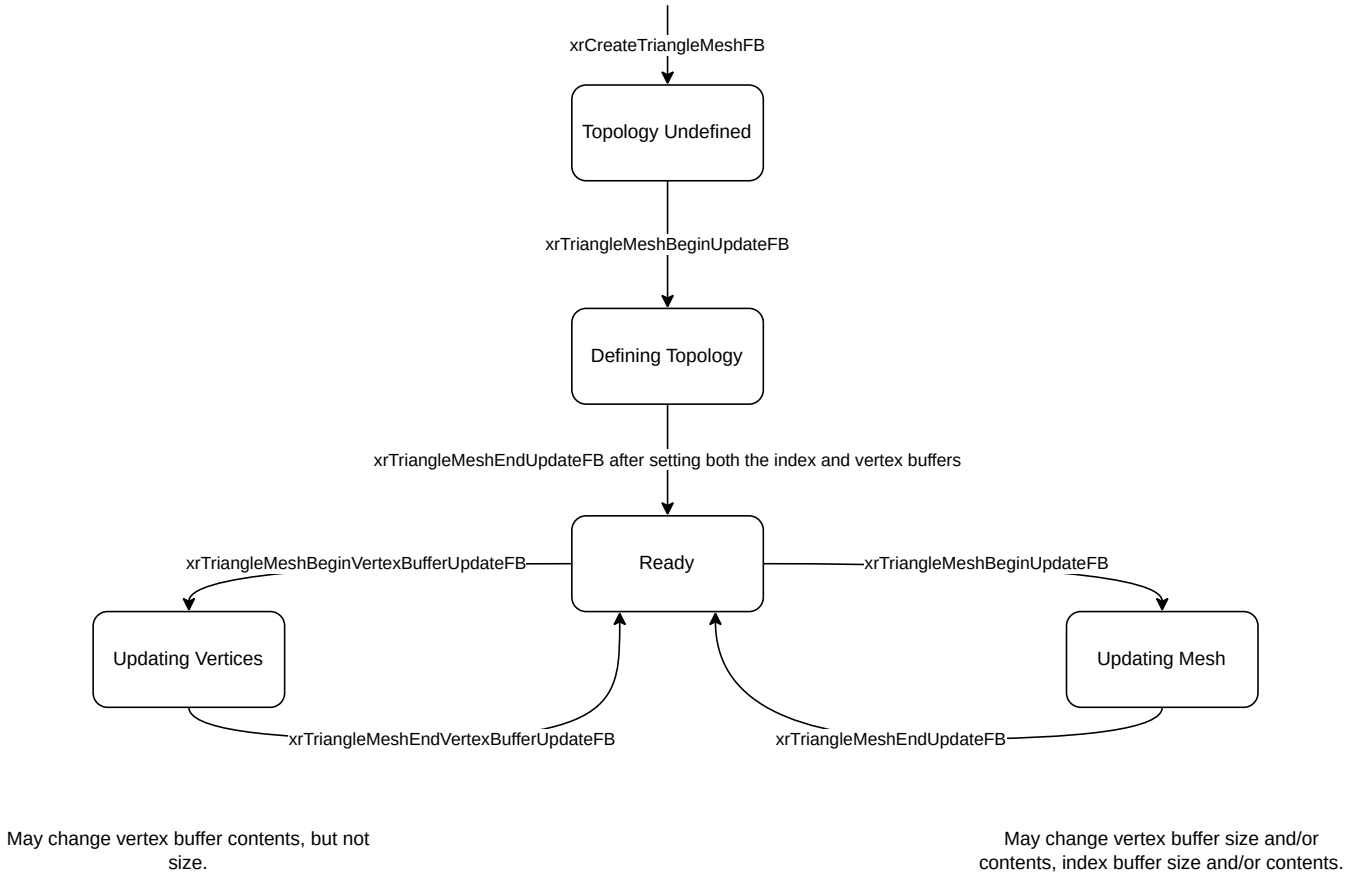

Figure 30. Mutable Triangle Mesh States

The states are as follows:

Undefined Topology

The default state immediately after creation of a mutable mesh. Move to Defining Topology by

calling xrTriangleMeshBeginUpdateFB.

Defining Topology

The application **must** set the initial vertex buffer and index buffer before moving to Ready by calling xrTriangleMeshEndUpdateFB.

Ready

In this state, the buffer contents/size **must** not be modified. To move to Updating Mesh call xrTriangleMeshBeginUpdateFB. To move to Updating Vertices call xrTriangleMeshBeginVertexBufferUpdateFB.

Updating Mesh

The application **may** modify the vertex buffer contents and/or the vertex count. The application **may** modify the index buffer contents and/or the index buffer element count. Move to Ready and commit changes by calling xrTriangleMeshEndUpdateFB.

Updating Vertices

The application **may** modify the vertex buffer contents, but not the vertex count. Move to Ready and commit changes by calling xrTriangleMeshEndVertexBufferUpdateFB.

New Functions

The xrCreateTriangleMeshFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrCreateTriangleMeshFB(
    XrSession                                   session,
    const XrTriangleMeshCreateInfoFB*           createInfo,
    XrTriangleMeshFB*                           outTriangleMesh);
```

Parameter Descriptions

- `session` is the XrSession to which the mesh will belong.
- `createInfo` is a pointer to an XrTriangleMeshCreateInfoFB structure containing parameters to be used to create the mesh.
- `outTriangleMesh` is a pointer to a handle in which the created XrTriangleMeshFB is returned.

This creates an XrTriangleMeshFB handle. The returned triangle mesh handle **may** be subsequently used in API calls.

When the mesh is mutable (the `XR_TRIANGLE_MESH_MUTABLE_BIT_FB` bit is set in XrTriangleMeshCreateInfoFB::`flags`), the created triangle mesh starts in the Undefined Topology state.

Immutable meshes have no state machine; they may be considered to be in state Ready with no valid edges leaving that state.

Valid Usage (Implicit)

- The XR_FB_triangle_mesh extension **must** be enabled prior to calling xrCreateTriangleMeshFB
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrTriangleMeshCreateInfoFB structure
- outTriangleMesh **must** be a pointer to an XrTriangleMeshFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_INSUFFICIENT_RESOURCES_PASSTHROUGH_FB
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyTriangleMeshFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrDestroyTriangleMeshFB(
    XrTriangleMeshFB                            mesh);
```

Parameter Descriptions

- `mesh` is the XrTriangleMeshFB to destroy.

XrTriangleMeshFB handles and their associated data are destroyed by xrDestroyTriangleMeshFB. The mesh buffers retrieved by xrTriangleMeshGetVertexBufferFB and xrTriangleMeshGetIndexBufferFB **must** not be accessed anymore after their parent mesh object has been destroyed.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrDestroyTriangleMeshFB
- `mesh` **must** be a valid XrTriangleMeshFB handle

Thread Safety

- Access to `mesh`, and any child handles, **must** be externally synchronized
- Access to the buffers returned from calls to xrTriangleMeshGetVertexBufferFB and xrTriangleMeshGetIndexBufferFB on `mesh` **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

The xrTriangleMeshGetVertexBufferFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshGetVertexBufferFB(
    XrTriangleMeshFB                            mesh,
    XrVector3f**                                outVertexBuffer);
```

Parameter Descriptions

- `mesh` is the XrTriangleMeshFB to get the vertex buffer for.
- `outVertexBuffer` is a pointer to return the vertex buffer into.

Retrieves a pointer to the vertex buffer. The vertex buffer is structured as an array of XrVector3f. The size of the buffer is XrTriangleMeshCreateInfoFB::`vertexCount` elements. The buffer location is guaranteed to remain constant over the lifecycle of the mesh object.

A mesh **must** be mutable and in a specific state for the application to **modify** it through the retrieved vertex buffer.

- A mutable triangle mesh **must** be in state Defining Topology, Updating Mesh, or Updating Vertices to modify the **contents** of the vertex buffer retrieved by this function.
- A mutable triangle mesh **must** be in state Defining Topology or Updating Mesh to modify the **count** of elements in the vertex buffer retrieved by this function. The new count is passed as a parameter to xrTriangleMeshEndUpdateFB.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrTriangleMeshGetVertexBufferFB
- `mesh` **must** be a valid XrTriangleMeshFB handle
- `outVertexBuffer` **must** be a pointer to a pointer to an XrVector3f structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrTriangleMeshGetIndexBufferFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshGetIndexBufferFB(
    XrTriangleMeshFB                            mesh,
    uint32_t**                                  outIndexBuffer);
```

Parameter Descriptions

- mesh is the XrTriangleMeshFB to get the index buffer for.
- outIndexBuffer is a pointer to return the index buffer into.

Retrieves a pointer to the index buffer that defines the topology of the triangle mesh. Each triplet of consecutive elements points to three vertices in the vertex buffer and thus form a triangle. The size of the index buffer is 3 * XrTriangleMeshCreateInfoFB::triangleCount elements. The buffer location is guaranteed to remain constant over the lifecycle of the mesh object.

A triangle mesh **must** be mutable and in state Defining Topology or Updating Mesh for the application to **modify** the contents and/or triangle count in the index buffer retrieved by this function.

Valid Usage (Implicit)

- The XR_FB_triangle_mesh extension **must** be enabled prior to calling xrTriangleMeshGetIndexBufferFB
- mesh **must** be a valid XrTriangleMeshFB handle
- outIndexBuffer **must** be a pointer to a pointer to a uint32_t value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrTriangleMeshBeginUpdateFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshBeginUpdateFB(
    XrTriangleMeshFB                            mesh);
```

Parameter Descriptions

- mesh is the XrTriangleMeshFB to update.

Begins updating the mesh buffer data. The application **must** call this function before it makes any modifications to the buffers retrieved by xrTriangleMeshGetVertexBufferFB and xrTriangleMeshGetIndexBufferFB. If only the vertex buffer contents need to be updated, and the mesh is in state Ready, xrTriangleMeshBeginVertexBufferUpdateFB **may** be used instead. To commit the modifications, the application **must** call xrTriangleMeshEndUpdateFB.

The triangle mesh `mesh` **must** be mutable. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the mesh is immutable.

The triangle mesh `mesh` **must** be in state Undefined Topology or Ready.

- If the triangle mesh is in state Undefined Topology before this call, a successful call moves it to state Defining Topology.
- If the triangle mesh is in state Ready before this call, a successful call moves it to state Updating Mesh.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrTriangleMeshBeginUpdateFB
- `mesh` **must** be a valid XrTriangleMeshFB handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CALL_ORDER_INVALID`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrTriangleMeshEndUpdateFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshEndUpdateFB(
    XrTriangleMeshFB                            mesh,
    uint32_t                                    vertexCount,
    uint32_t                                    triangleCount);
```

Parameter Descriptions

- `mesh` is the XrTriangleMeshFB to update.
- `vertexCount` is the vertex count after the update.
- `triangleCount` is the triangle count after the update.

Signals to the runtime that the application has finished initially populating or updating the mesh buffers. `vertexCount` and `triangleCount` specify the actual number of primitives that make up the mesh after the update. They **must** be larger than zero but smaller or equal to the maximum counts defined at create time. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if an invalid count is passed.

The triangle mesh `mesh` **must** be mutable. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the mesh is immutable.

The triangle mesh `mesh` **must** be in state Defining Topology or Updating Mesh.

A successful call moves `mesh` to state Ready.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrTriangleMeshEndUpdateFB
- `mesh` **must** be a valid XrTriangleMeshFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrTriangleMeshBeginVertexBufferUpdateFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshBeginVertexBufferUpdateFB(
    XrTriangleMeshFB                            mesh,
    uint32_t*                                   outVertexCount);
```

Parameter Descriptions

- mesh is the XrTriangleMeshFB to update.
- outVertexCount is a pointer to a value to populate with the current vertex count. The updated data must have the exact same number of vertices.

Begins an update of the vertex positions of a mutable triangle mesh. The vertex count returned through outVertexCount is defined by the last call to xrTriangleMeshEndUpdateFB. Once the modification is done, call xrTriangleMeshEndVertexBufferUpdateFB to commit the changes and move to state Ready.

The triangle mesh mesh **must** be mutable. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if the mesh is immutable.

The triangle mesh mesh **must** be in state Ready.

A successful call moves `mesh` to state Updating Vertices.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrTriangleMeshBeginVertexBufferUpdateFB
- `mesh` **must** be a valid XrTriangleMeshFB handle
- `outVertexCount` **must** be a pointer to a `uint32_t` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CALL_ORDER_INVALID`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The xrTriangleMeshEndVertexBufferUpdateFB function is defined as:

```
// Provided by XR_FB_triangle_mesh
XrResult xrTriangleMeshEndVertexBufferUpdateFB(
    XrTriangleMeshFB                            mesh);
```

Parameter Descriptions

- `mesh` is the XrTriangleMeshFB to update.

Signals to the runtime that the application has finished updating the vertex buffer data following a call to xrTriangleMeshBeginVertexBufferUpdateFB.

The triangle mesh `mesh` **must** be mutable. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the mesh is immutable.

The triangle mesh `mesh` **must** be in state Updating Vertices.

A successful call moves `mesh` to state Ready.

Valid Usage (Implicit)

- The `XR_FB_triangle_mesh` extension **must** be enabled prior to calling xrTriangleMeshEndVertexBufferUpdateFB
- `mesh` **must** be a valid XrTriangleMeshFB handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CALL_ORDER_INVALID`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Overview

This extension allows an application to create a spatial anchor to track a point in the physical environment. The runtime adjusts the pose of the anchor over time to align it with the real world.

Inspect system capability

The XrSystemAnchorPropertiesHTC structure is defined as:

```
// Provided by XR_HTC_anchor
typedef struct XrSystemAnchorPropertiesHTC {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsAnchor;
} XrSystemAnchorPropertiesHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsAnchor` indicates if current system is capable of anchor functionality.

An application **can** inspect whether the system is capable of anchor functionality by chaining an XrSystemAnchorPropertiesHTC structure to the XrSystemProperties when calling xrGetSystemProperties. The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if XrSystemAnchorPropertiesHTC::`supportsAnchor` was `XR_FALSE`.

Valid Usage (Implicit)

- The `XR_HTC_anchor` extension **must** be enabled prior to using XrSystemAnchorPropertiesHTC
- `type` **must** be `XR_TYPE_SYSTEM_ANCHOR_PROPERTIES_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrCreateSpatialAnchorHTC function is defined as:

```
// Provided by XR_HTC_anchor
XrResult xrCreateSpatialAnchorHTC(
    XrSession                                   session,
    const XrSpatialAnchorCreateInfoHTC*         createInfo,
    XrSpace*                                    anchor);
```

Parameter Descriptions

- `session` is the XrSession to create the anchor in.
- `createInfo` is the XrSpatialAnchorCreateInfoHTC used to specify the anchor.
- `anchor` is the returned XrSpace handle.

The xrCreateSpatialAnchorHTC function creates a spatial anchor with specified base space and pose in the space. The anchor is represented by an XrSpace and its pose can be tracked via xrLocateSpace. Once the anchor is no longer needed, call xrDestroySpace to erase the anchor.

Valid Usage (Implicit)

- The XR_HTC_anchor extension **must** be enabled prior to calling xrCreateSpatialAnchorHTC
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrSpatialAnchorCreateInfoHTC structure
- anchor **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_NAME_INVALID
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorCreateInfoHTC structure is defined as:

```
// Provided by XR_HTC_anchor
typedef struct XrSpatialAnchorCreateInfoHTC {
    XrStructureType           type;
    const void*               next;
    XrSpace                   space;
    XrPosef                   poseInSpace;
    XrSpatialAnchorNameHTC    name;
} XrSpatialAnchorCreateInfoHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is the XrSpace in which `poseInSpace` is specified.
- `poseInSpace` is the XrPosef specifying the point in the real world within `space`.
- `name` is the XrSpatialAnchorNameHTC containing the name of the anchor.

The `poseInSpace` is transformed into world space to specify the point in the real world. The anchor tracks changes of the reality and **may** not be affected by the changes of `space`.

Valid Usage (Implicit)

- The `XR_HTC_anchor` extension **must** be enabled prior to using XrSpatialAnchorCreateInfoHTC
- `type` **must** be `XR_TYPE_SPATIAL_ANCHOR_CREATE_INFO_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle
- `name` **must** be a valid XrSpatialAnchorNameHTC structure

The XrSpatialAnchorNameHTC structure is defined as:

```
// Provided by XR_HTC_anchor
typedef struct XrSpatialAnchorNameHTC {
    char    name[XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_HTC];
} XrSpatialAnchorNameHTC;
```

Member Descriptions

- `name` is a null-terminated UTF-8 string whose length is less than or equal to `XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_HTC`.

Valid Usage (Implicit)

- The XR_HTC_anchor extension **must** be enabled prior to using XrSpatialAnchorNameHTC
- name **must** be a null-terminated UTF-8 string whose length is less than or equal to XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_HTC

The xrGetSpatialAnchorNameHTC function is defined as:

```
// Provided by XR_HTC_anchor
XrResult xrGetSpatialAnchorNameHTC(
    XrSpace                                     anchor,
    XrSpatialAnchorNameHTC*                     name);
```

Parameter Descriptions

- anchor is the XrSpace created by xrCreateSpatialAnchorHTC.
- name is a pointer to output XrSpatialAnchorNameHTC.

The xrGetSpatialAnchorNameHTC function gets the name of an anchor. If the provided anchor is a valid space handle but was **not** created with xrCreateSpatialAnchorHTC, the runtime **must** return XR_ERROR_NOT_AN_ANCHOR_HTC.

Valid Usage (Implicit)

- The XR_HTC_anchor extension **must** be enabled prior to calling xrGetSpatialAnchorNameHTC
- anchor **must** be a valid XrSpace handle
- name **must** be a pointer to an XrSpatialAnchorNameHTC structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_NOT_AN_ANCHOR_HTC
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

New Object Types

New Flag Types

New Enum Constants

- XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_HTC

XrStructureType enumeration is extended with:

12.134.1. Overview

This extension allows an application to locate the user's individual body joints. It enables applications to render the full body in XR experience.

12.134.2. Inspect system capability

The XrSystemBodyTrackingPropertiesHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrSystemBodyTrackingPropertiesHTC {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsBodyTracking;
} XrSystemBodyTrackingPropertiesHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsBodyTracking` indicates if the current system is capable of track individual body joints.

An application **can** inspect whether the system is capable of body tracking by extending the XrSystemProperties with XrSystemBodyTrackingPropertiesHTC structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsBodyTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateBodyTrackerHTC.

Valid Usage (Implicit)

- The `XR_HTC_body_tracking` extension **must** be enabled prior to using XrSystemBodyTrackingPropertiesHTC
- `type` **must** be `XR_TYPE_SYSTEM_BODY_TRACKING_PROPERTIES_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.134.3. Create a body tracker handle

The XrBodyTrackerHTC handle represents the resources for a body tracker.

```
// Provided by XR_HTC_body_tracking
XR_DEFINE_HANDLE(XrBodyTrackerHTC)
```

An application **can** create an XrBodyTrackerHTC handle which is used to locate individual body joints

with an unobstructed range of motion using xrLocateBodyJointsHTC function.

The xrCreateBodyTrackerHTC function is defined as

```
// Provided by XR_HTC_body_tracking
XrResult xrCreateBodyTrackerHTC(
    XrSession                                   session,
    const XrBodyTrackerCreateInfoHTC*           createInfo,
    XrBodyTrackerHTC*                           bodyTracker);
```

Parameter Descriptions

- `session` is an XrSession in which the body tracking will be active.
- `createInfo` is the XrBodyTrackerCreateInfoHTC is used to specify the set of body joints.
- `bodyTracker` is the returned XrBodyTrackerHTC handle.

An application **can** create an XrBodyTrackerHTC handle using xrCreateBodyTrackerHTC.

If the system does not support body tracking, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateBodyTrackerHTC. In this case, the runtime **must** return `XR_FALSE` for XrSystemBodyTrackingPropertiesHTC::`supportsBodyTracking` in XrSystemBodyTrackingPropertiesHTC when the function xrGetSystemProperties is called, so that the application avoids creating a body tracker.

Valid Usage (Implicit)

- The `XR_HTC_body_tracking` extension **must** be enabled prior to calling xrCreateBodyTrackerHTC
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrBodyTrackerCreateInfoHTC structure
- `bodyTracker` **must** be a pointer to an XrBodyTrackerHTC handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrBodyTrackerCreateInfoHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodyTrackerCreateInfoHTC {
    XrStructureType      type;
    const void*          next;
    XrBodyJointSetHTC    bodyJointSet;
} XrBodyTrackerCreateInfoHTC;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- bodyJointSet is an XrBodyJointSetHTC value that describes the set of body joints to retrieve.

The XrBodyTrackerCreateInfoHTC structure describes the information to create an XrBodyTrackerHTC handle. If the supplied bodyJointSet is not valid, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.
.Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to using XrBodyTrackerCreateInfoHTC
- type **must** be XR_TYPE_BODY_TRACKER_CREATE_INFO_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- bodyJointSet **must** be a valid XrBodyJointSetHTC value

The xrDestroyBodyTrackerHTC function is defined as:

```
// Provided by XR_HTC_body_tracking
XrResult xrDestroyBodyTrackerHTC(
    XrBodyTrackerHTC                            bodyTracker);
```

Parameter Descriptions

- bodyTracker is an XrBodyTrackerHTC previously created by xrCreateBodyTrackerHTC.

xrDestroyBodyTrackerHTC releases the bodyTracker and the underlying resources when finished with body tracking experiences.

Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to calling xrDestroyBodyTrackerHTC
- bodyTracker **must** be a valid XrBodyTrackerHTC handle

Thread Safety

- Access to bodyTracker, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.134.4. Locate body joints

The xrLocateBodyJointsHTC function is defined as:

```
// Provided by XR_HTC_body_tracking
XrResult xrLocateBodyJointsHTC(
    XrBodyTrackerHTC                            bodyTracker,
    const XrBodyJointsLocateInfoHTC*            locateInfo,
    XrBodyJointLocationsHTC*                    locations);
```

Parameter Descriptions

- bodyTracker is an XrBodyTrackerHTC previously created by xrCreateBodyTrackerHTC.
- locateInfo is a pointer to XrBodyJointsLocateInfoHTC describing information to locate body joints.
- locations is a pointer to XrBodyJointLocationsHTC receiving the returned body joint locations.

The xrLocateBodyJointsHTC function locates an array of body joints relative to a base space at a given time.

If XrBodyJointLocationsHTC::jointLocationCount does not match the value associated with the supplied XrBodyJointSetHTC value, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to calling xrLocateBodyJointsHTC
- bodyTracker **must** be a valid XrBodyTrackerHTC handle
- locateInfo **must** be a pointer to a valid XrBodyJointsLocateInfoHTC structure
- locations **must** be a pointer to an XrBodyJointLocationsHTC structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrBodyJointsLocateInfoHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodyJointsLocateInfoHTC {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
} XrBodyJointsLocateInfoHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is an XrSpace within which the returned body joint locations will be represented.
- `time` is an `XrTime` at which to locate the body joints.

The XrBodyJointsLocateInfoHTC structure describes the information to locate individual body joints.

Valid Usage (Implicit)

- The `XR_HTC_body_tracking` extension **must** be enabled prior to using XrBodyJointsLocateInfoHTC
- `type` **must** be `XR_TYPE_BODY_JOINTS_LOCATE_INFO_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The XrBodyJointLocationsHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodyJointLocationsHTC {
    XrStructureType             type;
    void*                       next;
    XrSpaceLocationFlags        combinedLocationFlags;
    XrBodyJointConfidenceHTC    confidenceLevel;
    uint32_t                    jointLocationCount;
    XrBodyJointLocationHTC*     jointLocations;
    uint32_t                    skeletonGenerationId;
} XrBodyJointLocationsHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `combinedLocationFlags` is a bitfield, with bit masks defined in XrSpaceLocationFlagBits, containing the bitwise OR of the location flags of all body joints.
- `confidenceLevel` is an XrBodyJointConfidenceHTC value which indicates the confidence level for the returned body joint pose.
- `jointLocationCount` is a `uint32_t` describing the count of elements in `jointLocations` array.
- `jointLocations` is an application-allocated XrBodyJointLocationHTC array filled in by the runtime specifying the locations for individual body joints.
- `skeletonGenerationId` is a unique identifier, representing the skeleton which is generated when the tracking auto-calibrates the user skeleton scale and proportions.

The application **must** set `jointLocationCount` as appropriate for the chosen XrBodyJointSetHTC value when creating the XrBodyTrackerHTC. If `jointLocationCount` does not match the value associated with the supplied XrBodyJointSetHTC value, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` from xrLocateBodyJointsHTC.

An application **must** allocate the output `jointLocations` array with a minimum capacity of `jointLocationCount` of XrBodyJointLocationHTC elements. If the application supplies a `NULL` value for `jointLocations`, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The runtime **must** update the `jointLocations` array elements indexed using the corresponding body joint enumeration (e.g. XrBodyJointHTC for the joint set `XR_BODY_JOINT_SET_FULL_HTC`) as described by XrBodyJointSetHTC when creating the XrBodyTrackerHTC. For example, when the XrBodyTrackerHTC is created with `XR_BODY_JOINT_SET_FULL_HTC`, the runtime **must** fill the `jointLocations` array with body joint data indexed by the XrBodyJointHTC enumeration.

If the runtime returns `combinedLocationFlags` with `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` set, it indicates that the body tracker detects the joint space locations. If the runtime returns `combinedLocationFlags` with neither `XR_SPACE_LOCATION_POSITION_VALID_BIT` nor `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` set, it indicates that the body tracker did not detect the joint space locations.

The purpose of the skeleton is to provide data about the body size. The calculation of the body size **may** be updated during a session. Each time the calculation of the size is changed, XrBodyJointLocationsHTC::`skeletonGenerationId` is changed to indicate that a new skeleton **may** be retrieved. xrGetBodySkeletonHTC **can** be called with the specified skeletonGenerationId to get the corresponding skeleton.

Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to using XrBodyJointLocationsHTC
- type **must** be XR_TYPE_BODY_JOINT_LOCATIONS_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- combinedLocationFlags **must** be 0 or a valid combination of XrSpaceLocationFlagBits values
- confidenceLevel **must** be a valid XrBodyJointConfidenceHTC value
- jointLocations **must** be a pointer to an array of jointLocationCount XrBodyJointLocationHTC structures
- The jointLocationCount parameter **must** be greater than 0

The XrBodyJointConfidenceHTC enumeration is defined as:

```
// Provided by XR_HTC_body_tracking
typedef enum XrBodyJointConfidenceHTC {
    XR_BODY_JOINT_CONFIDENCE_NONE_HTC = 0,
    XR_BODY_JOINT_CONFIDENCE_LOW_HTC = 1,
    XR_BODY_JOINT_CONFIDENCE_HIGH_HTC = 2,
    XR_BODY_JOINT_CONFIDENCE_MAX_ENUM_HTC = 0x7FFFFFFF
} XrBodyJointConfidenceHTC;
```

Enumerant Descriptions

- XR_BODY_JOINT_CONFIDENCE_NONE_HTC — No confidence for the returned body joint pose.
- XR_BODY_JOINT_CONFIDENCE_LOW_HTC — Low confience for the returned body joint pose. It indicates some of the body joints may not be tracked.
- XR_BODY_JOINT_CONFIDENCE_HIGH_HTC — High confidence for the returned body joint pose. It indicates almost all of the critical body joints are tracked.

The XrBodyJointConfidenceHTC enumeration describes the confidence level for the returned body joint pose.

The XrBodyJointLocationHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodyJointLocationHTC {
    XrSpaceLocationFlags    locationFlags;
    XrPosef                 pose;
} XrBodyJointLocationHTC;
```

Member Descriptions

- `locationFlags` is a bitfield, with bit masks defined in XrSpaceLocationFlagBits, to indicate which members contain valid data. For those bits that are not set, reading the relevant fields in this structure and its nested structures **must** be defined, but the values are unspecified and not meaningful.
- `pose` is an XrPosef describing the position and orientation of the origin of a body joint within the reference frame of the corresponding XrBodyJointsLocateInfoHTC::`baseSpace`.

XrBodyJointLocationHTC structure describes the position, orientation, and location flag of a body joint. It is populated by the runtime during a call to xrLocateBodyJointsHTC.

Valid Usage (Implicit)

- The `XR_HTC_body_tracking` extension **must** be enabled prior to using XrBodyJointLocationHTC

12.134.5. Get body skeleton

The xrGetBodySkeletonHTC function is defined as:

```
// Provided by XR_HTC_body_tracking
XrResult xrGetBodySkeletonHTC(
    XrBodyTrackerHTC                            bodyTracker,
    XrSpace                                     baseSpace,
    uint32_t                                    skeletonGenerationId,
    XrBodySkeletonHTC*                          skeleton);
```

Parameter Descriptions

- `bodyTracker` is an XrBodyTrackerHTC previously created by xrCreateBodyTrackerHTC.
- `baseSpace` is an XrSpace within which the returned body skeleton in T-pose will be represented.
- `skeletonGenerationId` is the skeleton id of the skeleton.
- `skeleton` is a pointer to XrBodySkeletonHTC receiving the returned body skeleton.

The xrGetBodySkeletonHTC function returns the body skeleton in T-pose. This function **can** be used to get body skeleton and infer the skeleton scale and proportions in conjunction with XrBodyJointLocationsHTC::`skeletonGenerationId`. XrBodyJointLocationsHTC::`skeletonGenerationId` is generated when the tracking auto-calibrates the user skeleton scale and proportions.

If the application supplies a `skeletonGenerationId` that does not match any value returned in XrBodyJointLocationsHTC::`skeletonGenerationId` during the current session, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_HTC_body_tracking` extension **must** be enabled prior to calling xrGetBodySkeletonHTC
- `bodyTracker` **must** be a valid XrBodyTrackerHTC handle
- `baseSpace` **must** be a valid XrSpace handle
- `skeleton` **must** be a pointer to an XrBodySkeletonHTC structure
- Both of `baseSpace` and `bodyTracker` **must** have been created, allocated, or retrieved from the same XrSession

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrBodySkeletonHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodySkeletonHTC {
    XrStructureType            type;
    void*                      next;
    uint32_t                   jointCount;
    XrBodySkeletonJointHTC*    joints;
} XrBodySkeletonHTC;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- jointCount is an uint32_t describing the count of elements in joints array.
- joints is an application-allocated array of XrBodySkeletonJointHTC that will be filled with skeleton joint elements.

The XrBodySkeletonHTC structure is a container to represent the body skeleton in T-pose including each joint pose. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if jointCount does not equal the number of joints associated with the XrBodyJointSetHTC value used to create the XrBodyTrackerHTC.

The application **must** allocate an array of at least jointCount elements for joints, to be populated by

the runtime. If joints is NULL, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

The runtime **must** return joints representing the default pose of the current estimation regarding the user's skeleton.

The runtime **must** update the joints array ordered so that it is indexed using the corresponding body joint enumeration (e.g. XrBodyJointHTC for the joint set XR_BODY_JOINT_SET_FULL_HTC) as associated with the XrBodyJointSetHTC value used when creating the XrBodyTrackerHTC. For example, when the XrBodyTrackerHTC is created with XR_BODY_JOINT_SET_FULL_HTC, the runtime **must** fill the joints array indexed by the XrBodyJointHTC enumeration.

Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to using XrBodySkeletonHTC
- type **must** be XR_TYPE_BODY_SKELETON_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- joints **must** be a pointer to an array of jointCount XrBodySkeletonJointHTC structures
- The jointCount parameter **must** be greater than 0

The XrBodySkeletonJointHTC structure is defined as:

```
// Provided by XR_HTC_body_tracking
typedef struct XrBodySkeletonJointHTC {
    XrPosef    pose;
} XrBodySkeletonJointHTC;
```

Member Descriptions

- pose is an XrPosef defining the position and orientation of the origin of a body joint within the reference frame of the corresponding xrGetBodySkeletonHTC::baseSpace.

XrBodySkeletonJointHTC structure describes the position, orientation of the joint in space, and position of the joint in the skeleton.

Valid Usage (Implicit)

- The XR_HTC_body_tracking extension **must** be enabled prior to using XrBodySkeletonJointHTC

12.134.6. Conventions of body joints

The XrBodyJointSetHTC enumeration is defined as:

```
// Provided by XR_HTC_body_tracking
typedef enum XrBodyJointSetHTC {
    XR_BODY_JOINT_SET_FULL_HTC = 0,
    XR_BODY_JOINT_SET_MAX_ENUM_HTC = 0x7FFFFFFF
} XrBodyJointSetHTC;
```

Enumerant Descriptions

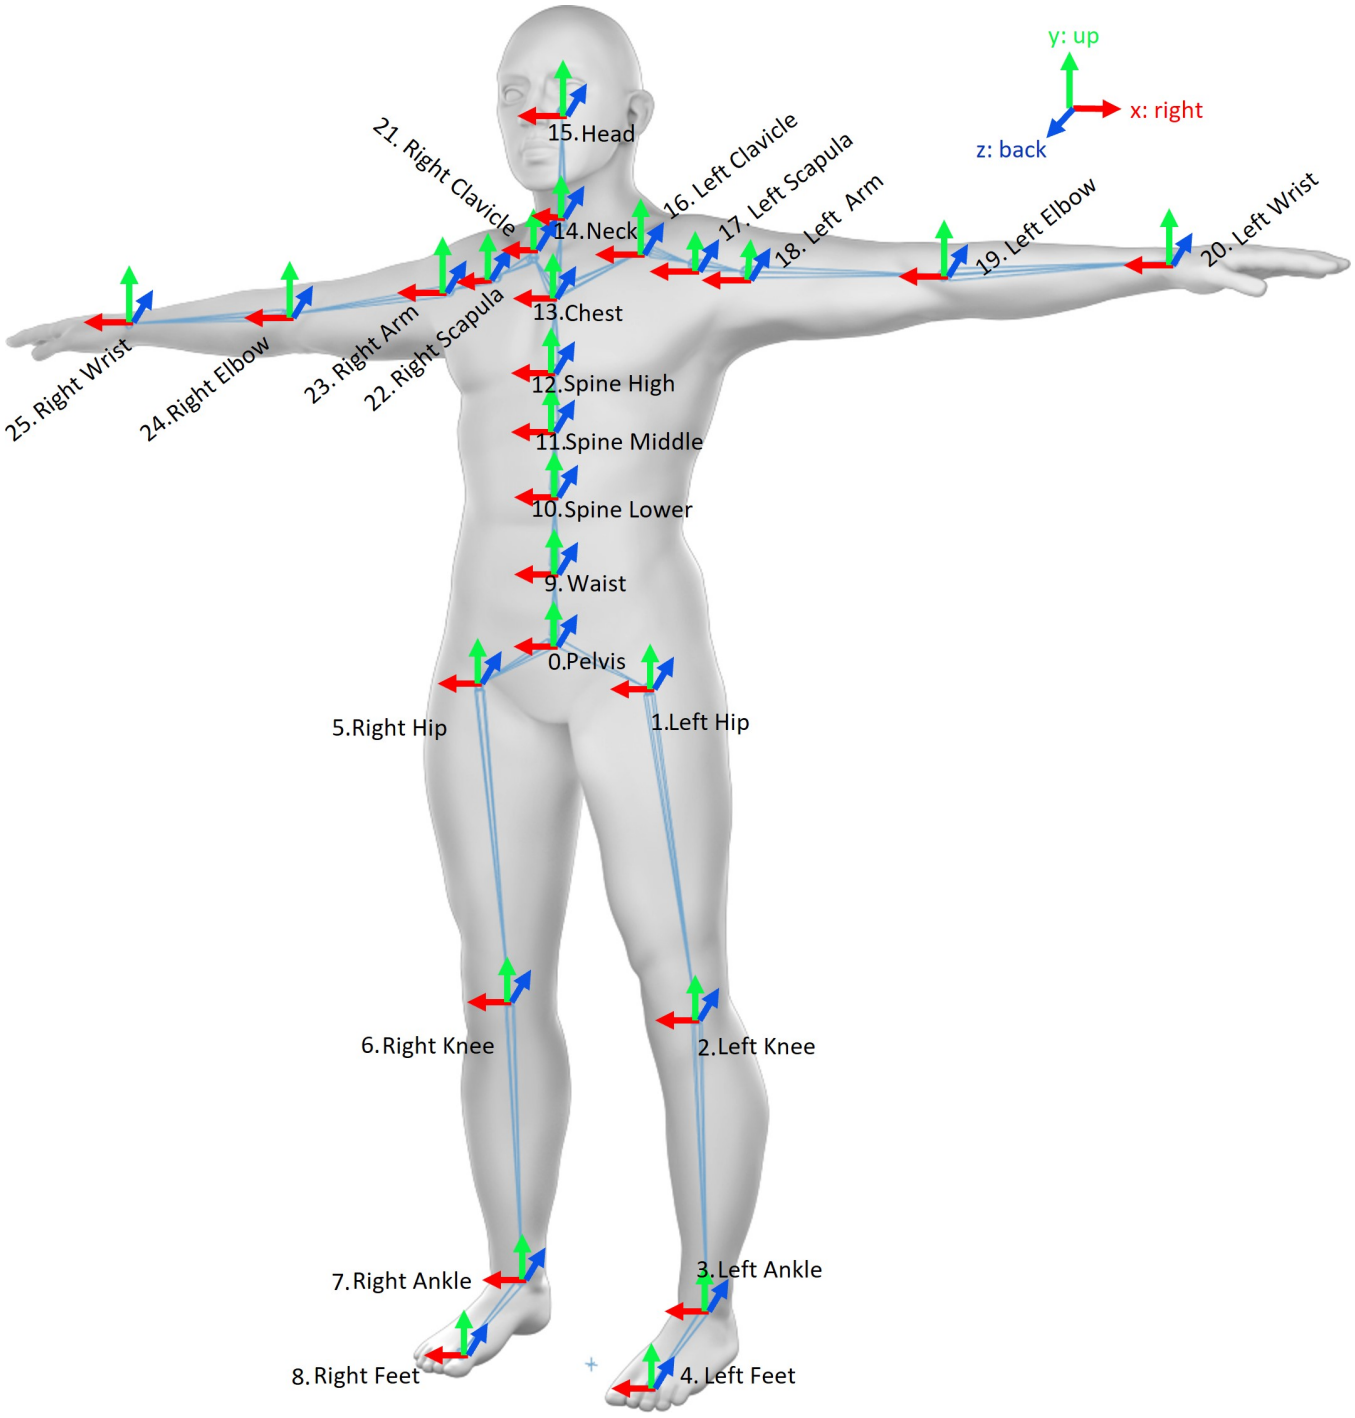
- XR_BODY_JOINT_SET_FULL_HTC indicates that the created XrBodyTrackerHTC tracks the set of body joints described by XrBodyJointHTC enum, i.e. the xrLocateBodyJointsHTC function returns an array of joint locations with the count of XR_BODY_JOINT_COUNT_HTC and is indexed using XrBodyJointHTC.

The XrBodyJointSetHTC enumeration describes the set of body joints to track when creating an XrBodyTrackerHTC.

The XrBodyJointHTC enumeration is defined as:

```
// Provided by XR_HTC_body_tracking
typedef enum XrBodyJointHTC {
    XR_BODY_JOINT_PELVIS_HTC = 0,
    XR_BODY_JOINT_LEFT_HIP_HTC = 1,
    XR_BODY_JOINT_LEFT_KNEE_HTC = 2,
    XR_BODY_JOINT_LEFT_ANKLE_HTC = 3,
    XR_BODY_JOINT_LEFT_FEET_HTC = 4,
    XR_BODY_JOINT_RIGHT_HIP_HTC = 5,
    XR_BODY_JOINT_RIGHT_KNEE_HTC = 6,
    XR_BODY_JOINT_RIGHT_ANKLE_HTC = 7,
    XR_BODY_JOINT_RIGHT_FEET_HTC = 8,
    XR_BODY_JOINT_WAIST_HTC = 9,
    XR_BODY_JOINT_SPINE_LOWER_HTC = 10,
    XR_BODY_JOINT_SPINE_MIDDLE_HTC = 11,
    XR_BODY_JOINT_SPINE_HIGH_HTC = 12,
    XR_BODY_JOINT_CHEST_HTC = 13,
    XR_BODY_JOINT_NECK_HTC = 14,
    XR_BODY_JOINT_HEAD_HTC = 15,
    XR_BODY_JOINT_LEFT_CLAVICLE_HTC = 16,
    XR_BODY_JOINT_LEFT_SCAPULA_HTC = 17,
    XR_BODY_JOINT_LEFT_ARM_HTC = 18,
    XR_BODY_JOINT_LEFT_ELBOW_HTC = 19,
    XR_BODY_JOINT_LEFT_WRIST_HTC = 20,
    XR_BODY_JOINT_RIGHT_CLAVICLE_HTC = 21,
    XR_BODY_JOINT_RIGHT_SCAPULA_HTC = 22,
    XR_BODY_JOINT_RIGHT_ARM_HTC = 23,
    XR_BODY_JOINT_RIGHT_ELBOW_HTC = 24,
    XR_BODY_JOINT_RIGHT_WRIST_HTC = 25,
    XR_BODY_JOINT_MAX_ENUM_HTC = 0x7FFFFFFF
} XrBodyJointHTC;
```

It is used to index into a joint location array when the joint set in use (XrBodyJointSetHTC) is XR_BODY_JOINT_SET_FULL_HTC.



This extension defines 26 joints for body tracking: 6 joints for the torso, 5 joints for each arm, 4 joints for each leg, and the other 2 joints for the head and neck. The definitions of these joints are based on human skeletal joints.

As shown in the figure below, the following conventions are stated with a T-shape body pose in which the palms are facing down to the ground.

The right direction (+X) is pointing from left hand to right hand in T-pose.

The up direction (+Y) is pointing from foot to head in T-pose.

The Z direction is perpendicular to X and Y and follows the right hand rule in T-pose.

```
// Provided by XR_HTC_body_tracking
#define XR_BODY_JOINT_COUNT_HTC 26
```

XR_BODY_JOINT_COUNT_HTC defines the number of body joint enumerants defined in XrBodyJointHTC.

12.134.7. Example code for locating body joints

The following example code demonstrates how to locate all individual body joints relative to a world

space.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized
XrSpace worldSpace;  // previously initialized, e.g. from
                     // XR_REFERENCE_SPACE_TYPE_LOCAL

// Inspect body tracking system properties
XrSystemBodyTrackingPropertiesHTC bodyTrackingSystemProperties {
  .type = XR_TYPE_SYSTEM_BODY_TRACKING_PROPERTIES_HTC,
};
XrSystemProperties systemProperties {
  .type = XR_TYPE_SYSTEM_PROPERTIES,
  .next = &bodyTrackingSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!bodyTrackingSystemProperties.supportsBodyTracking) {
    // The system does not support body tracking
    return;
}

// Get function pointer for xrCreateBodyTrackerHTC
PFN_xrCreateBodyTrackerHTC pfnCreateBodyTrackerHTC = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateBodyTrackerHTC",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateBodyTrackerHTC)));

// Create a body tracker that tracks default set of individual body joints.
XrBodyTrackerHTC bodyTracker {XR_NULL_HANDLE};
{
    XrBodyTrackerCreateInfoHTC createInfo {
      .type = XR_TYPE_BODY_TRACKER_CREATE_INFO_HTC,
      .bodyJointSet = XR_BODY_JOINT_SET_FULL_HTC,
    };
    CHK_XR(pfnCreateBodyTrackerHTC(session, &createInfo, &bodyTracker));
}

// Allocate buffers to receive joint location before frame loop starts
XrBodyJointLocationHTC jointLocations[XR_BODY_JOINT_COUNT_HTC];
XrBodyJointLocationsHTC locations {
  .type = XR_TYPE_BODY_JOINT_LOCATIONS_HTC,
  .jointLocationCount = XR_BODY_JOINT_COUNT_HTC,
  .jointLocations = jointLocations,
};

// Get function pointer for xrLocateBodyJointsHTC
```

```
PFN_xrLocateBodyJointsHTC pfnLocateBodyJointsHTC = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrLocateBodyJointsHTC",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnLocateBodyJointsHTC)));
while (1) {
    // ...
    // For every frame in frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrBodyJointsLocateInfoHTC locateInfo {
      .type = XR_TYPE_BODY_JOINTS_LOCATE_INFO_HTC,
      .baseSpace = worldSpace,
      .time = time,
    };

    CHK_XR(pfnLocateBodyJointsHTC(bodyTracker, &locateInfo, &locations));

    // The returned joint location array is directly indexed with
    // XrBodyJointHTC enum.
    const XrPosef &pelvisInWorld =
        jointLocations[XR_BODY_JOINT_PELVIS_HTC].pose;
    const XrPosef &headInWorld =
        jointLocations[XR_BODY_JOINT_HEAD_HTC].pose;

}
```

12.134.8. New Macros

- XR_BODY_JOINT_COUNT_HTC

12.134.9. New Object Types

- XrBodyTrackerHTC

12.134.10. New Commands

- xrCreateBodyTrackerHTC
- xrDestroyBodyTrackerHTC
- xrGetBodySkeletonHTC
- xrLocateBodyJointsHTC

Overview

This extension allows an application to track and integrate users' eye and lip movements, empowering developers to read intention and model facial expressions.

Inspect system capability

XrSystemFacialTrackingPropertiesHTC is defined as:

```
// Provided by XR_HTC_facial_tracking
typedef struct XrSystemFacialTrackingPropertiesHTC {
    XrStructureType    type;
    void*              next;
    XrBool32           supportEyeFacialTracking;
    XrBool32           supportLipFacialTracking;
} XrSystemFacialTrackingPropertiesHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportEyeFacialTracking` indicates if the current system is capable of generating eye expressions.
- `supportLipFacialTracking` indicates if the current system is capable of generating lip expressions.

An application **can** inspect whether the system is capable of two of the facial tracking by extending the XrSystemProperties with XrSystemFacialTrackingPropertiesHTC structure when calling xrGetSystemProperties.

Valid Usage (Implicit)

- The `XR_HTC_facial_tracking` extension **must** be enabled prior to using XrSystemFacialTrackingPropertiesHTC
- `type` **must** be `XR_TYPE_SYSTEM_FACIAL_TRACKING_PROPERTIES_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

If a runtime returns `XR_FALSE` for `supportEyeFacialTracking`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFacialTrackerHTC with `XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC` set for XrFacialTrackingTypeHTC in XrFacialTrackerCreateInfoHTC. Similarly, if a runtime returns `XR_FALSE` for `supportLipFacialTracking` the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFacialTrackerHTC with `XR_FACIAL_TRACKING_TYPE_LIP_DEFAULT_HTC` set for XrFacialTrackingTypeHTC in XrFacialTrackerCreateInfoHTC.

Create a facial tracker handle

The XrFacialTrackerHTC handle represents the resources for an facial tracker of the specific facial tracking type.

```
// Provided by XR_HTC_facial_tracking
XR_DEFINE_HANDLE(XrFacialTrackerHTC)
```

An application creates separate XrFacialTrackerHTC handles for eye tracker or lip tracker. This handle can be used to retrieve corresponding facial expressions using xrGetFacialExpressionsHTC function.

The xrCreateFacialTrackerHTC function is defined as

```
// Provided by XR_HTC_facial_tracking
XrResult xrCreateFacialTrackerHTC(
    XrSession                                   session,
    const XrFacialTrackerCreateInfoHTC*         createInfo,
    XrFacialTrackerHTC*                         facialTracker);
```

Parameter Descriptions

- `session` is an XrSession in which the facial expression will be active.
- `createInfo` is the XrFacialTrackerCreateInfoHTC used to specify the facial tracking type.
- `facialTracker` is the returned XrFacialTrackerHTC handle.

An application **can** create an XrFacialTrackerHTC handle using xrCreateFacialTrackerHTC.

If the system does not support eye tracking or lip tracking, runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFacialTrackerHTC according to the corresponding case. In this case, the runtime **must** return `XR_FALSE` for XrSystemFacialTrackingPropertiesHTC ::`supportEyeFacialTracking` or XrSystemFacialTrackingPropertiesHTC::`supportLipFacialTracking` when the function xrGetSystemProperties is called, so that the application **may** avoid creating a facial tracker.

Valid Usage (Implicit)

- The `XR_HTC_facial_tracking` extension **must** be enabled prior to calling xrCreateFacialTrackerHTC
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrFacialTrackerCreateInfoHTC structure
- `facialTracker` **must** be a pointer to an XrFacialTrackerHTC handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrFacialTrackerCreateInfoHTC structure is defined as:

```
// Provided by XR_HTC_facial_tracking
typedef struct XrFacialTrackerCreateInfoHTC {
    XrStructureType            type;
    const void*                next;
    XrFacialTrackingTypeHTC    facialTrackingType;
} XrFacialTrackerCreateInfoHTC;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- facialTrackingType is an XrFacialTrackingTypeHTC which describes which type of facial tracking should be used for this handle.

The XrFacialTrackerCreateInfoHTC structure describes the information to create an XrFacialTrackerHTC handle.

Valid Usage (Implicit)

- The XR_HTC_facial_tracking extension **must** be enabled prior to using XrFacialTrackerCreateInfoHTC
- type **must** be XR_TYPE_FACIAL_TRACKER_CREATE_INFO_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- facialTrackingType **must** be a valid XrFacialTrackingTypeHTC value

The XrFacialTrackingTypeHTC describes which type of tracking the XrFacialTrackerHTC is using.

```
// Provided by XR_HTC_facial_tracking
typedef enum XrFacialTrackingTypeHTC {
    XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC = 1,
    XR_FACIAL_TRACKING_TYPE_LIP_DEFAULT_HTC = 2,
    XR_FACIAL_TRACKING_TYPE_MAX_ENUM_HTC = 0x7FFFFFFF
} XrFacialTrackingTypeHTC;
```

Enumerant Descriptions

- XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC — Specifies this handle will observe eye expressions, with values indexed by XrEyeExpressionHTC whose count is XR_FACIAL_EXPRESSION_EYE_COUNT_HTC.
- XR_FACIAL_TRACKING_TYPE_LIP_DEFAULT_HTC — Specifies this handle will observe lip expressions, with values indexed by XrLipExpressionHTC whose count is XR_FACIAL_EXPRESSION_LIP_COUNT_HTC.

The xrDestroyFacialTrackerHTC function is defined as:

```
// Provided by XR_HTC_facial_tracking
XrResult xrDestroyFacialTrackerHTC(
    XrFacialTrackerHTC                          facialTracker);
```

Parameter Descriptions

- facialTracker is an XrFacialTrackerHTC previously created by xrCreateFacialTrackerHTC.

xrDestroyFacialTrackerHTC releases the facialTracker and the underlying resources when finished with facial tracking experiences.

Valid Usage (Implicit)

- The XR_HTC_facial_tracking extension **must** be enabled prior to calling xrDestroyFacialTrackerHTC
- facialTracker **must** be a valid XrFacialTrackerHTC handle

Thread Safety

- Access to facialTracker, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Retrieve facial expressions

The xrGetFacialExpressionsHTC function is defined as:

```
// Provided by XR_HTC_facial_tracking
XrResult xrGetFacialExpressionsHTC(
    XrFacialTrackerHTC                          facialTracker,
    XrFacialExpressionsHTC*                     facialExpressions);
```

Parameter Descriptions

- facialTracker is an XrFacialTrackerHTC previously created by xrCreateFacialTrackerHTC.
- facialExpressions is a pointer to XrFacialExpressionsHTC receiving the returned facial expressions.

xrGetFacialExpressionsHTC retrieves an array of values of blend shapes for a facial expression on a given time.

Valid Usage (Implicit)

- The XR_HTC_facial_tracking extension **must** be enabled prior to calling xrGetFacialExpressionsHTC
- facialTracker **must** be a valid XrFacialTrackerHTC handle
- facialExpressions **must** be a pointer to an XrFacialExpressionsHTC structure

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrFacialExpressionsHTC structure is defined as:

```
// Provided by XR_HTC_facial_tracking
typedef struct XrFacialExpressionsHTC {
    XrStructureType    type;
    const void*        next;
    XrBool32           isActive;
    XrTime             sampleTime;
    uint32_t           expressionCount;
    float*             expressionWeightings;
} XrFacialExpressionsHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `isActive` is an `XrBool32` indicating if the facial tracker is active.
- `sampleTime` is when in time the expression is expressed.
- `expressionCount` is a `uint32_t` describing the count of elements in `expressionWeightings` array.
- `expressionWeightings` is a `float` array filled in by the runtime, specifying the weightings for each blend shape.

XrFacialExpressionsHTC structure returns data of a lip facial expression or an eye facial expression.

An application **must** preallocate the output `expressionWeightings` array that can contain at least `expressionCount` of `float`. `expressionCount` **must** be at least XR_FACIAL_EXPRESSION_LIP_COUNT_HTC for `XR_FACIAL_TRACKING_TYPE_LIP_DEFAULT_HTC`, and at least XR_FACIAL_EXPRESSION_EYE_COUNT_HTC for `XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC`.

The application **must** set `expressionCount` as described by the XrFacialTrackingTypeHTC when creating the XrFacialTrackerHTC otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The runtime **must** update the `expressionWeightings` array ordered so that the application can index elements using the corresponding facial tracker enum (e.g. XrEyeExpressionHTC or XrLipExpressionHTC) as described by XrFacialTrackingTypeHTC when creating the XrFacialTrackerHTC. For example, when the XrFacialTrackerHTC is created with XrFacialTrackerHTC ::`facialTrackingType` set to `XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC`, the application **must** set the `expressionCount` to XR_FACIAL_EXPRESSION_EYE_COUNT_HTC, and the runtime **must** fill the `expressionWeightings` array ordered with eye expression data so that it can be indexed by the XrEyeExpressionHTC enum.

If the returned `isActive` is true, the runtime **must** fill the `expressionWeightings` array ordered.

If the returned `isActive` is false, it indicates the facial tracker did not detect the corresponding facial input or the application lost input focus.

If the input `expressionCount` is not sufficient to contain all output indices, the runtime **must** return `XR_ERROR_SIZE_INSUFFICIENT` on calls to xrGetFacialExpressionsHTC and not change the content in `expressionWeightings`.

Valid Usage (Implicit)

- The XR_HTC_facial_tracking extension **must** be enabled prior to using XrFacialExpressionsHTC
- type **must** be XR_TYPE_FACIAL_EXPRESSIONS_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- expressionWeightings **must** be a pointer to a float value

```
// Provided by XR_HTC_facial_tracking
#define XR_FACIAL_EXPRESSION_EYE_COUNT_HTC 14
```

The number of blend shapes in an expression of type XR_FACIAL_TRACKING_TYPE_EYE_DEFAULT_HTC.

```
// Provided by XR_HTC_facial_tracking
#define XR_FACIAL_EXPRESSION_LIP_COUNT_HTC 37
```

The number of blend shapes in an expression of type XR_FACIAL_TRACKING_TYPE_LIP_DEFAULT_HTC.

Facial Expression List

- **Eye Blend Shapes**

Through feeding the blend shape values of eye expression to an avatar, its facial expression can be animated with the player's eye movement. The following pictures show how the facial expression acts on the avatar according to each set of eye blend shape values.

```
// Provided by XR_HTC_facial_tracking
typedef enum XrEyeExpressionHTC {
    XR_EYE_EXPRESSION_LEFT_BLINK_HTC = 0,
    XR_EYE_EXPRESSION_LEFT_WIDE_HTC = 1,
    XR_EYE_EXPRESSION_RIGHT_BLINK_HTC = 2,
    XR_EYE_EXPRESSION_RIGHT_WIDE_HTC = 3,
    XR_EYE_EXPRESSION_LEFT_SQUEEZE_HTC = 4,
    XR_EYE_EXPRESSION_RIGHT_SQUEEZE_HTC = 5,
    XR_EYE_EXPRESSION_LEFT_DOWN_HTC = 6,
    XR_EYE_EXPRESSION_RIGHT_DOWN_HTC = 7,
    XR_EYE_EXPRESSION_LEFT_OUT_HTC = 8,
    XR_EYE_EXPRESSION_RIGHT_IN_HTC = 9,
    XR_EYE_EXPRESSION_LEFT_IN_HTC = 10,
    XR_EYE_EXPRESSION_RIGHT_OUT_HTC = 11,
    XR_EYE_EXPRESSION_LEFT_UP_HTC = 12,
    XR_EYE_EXPRESSION_RIGHT_UP_HTC = 13,
    XR_EYE_EXPRESSION_MAX_ENUM_HTC = 0x7FFFFFFF
} XrEyeExpressionHTC;
```

XR_EYE_EXPRESSION_LEFT_WIDE_HTC	
	**Description** This blend shape keeps left eye wide and at that time XR_EYE_EXPRESSION_LEFT_BLINK_HTC value is 0.

XR_EYE_EXPRESSION_RIGHT_WIDE_HTC	
	**Description** This blend shape keeps right eye wide and at that time XR_EYE_EXPRESSION_RIGHT_BLINK_HTC value is 0.

`XR_EYE_EXPRESSION_LEFT_BLINK_HTC`

Description
This blend shape influences blinking of the right eye. When this value goes higher, left eye approaches close.

`XR_EYE_EXPRESSION_RIGHT_BLINK_HTC`

Description
This blend shape influences blinking of the right eye. When this value goes higher, right eye approaches close.

`XR_EYE_EXPRESSION_LEFT_SQUEEZE_HTC`

Description
The blend shape closes eye tightly and at that time `XR_EYE_EXPRESSION_LEFT_BLINK_HTC` value is 1.

`XR_EYE_EXPRESSION_RIGHT_SQUEEZE_HTC`

Description
The blend shape closes eye tightly and at that time `XR_EYE_EXPRESSION_RIGHT_BLINK_HTC` value is 1.

XR_EYE_EXPRESSION_LEFT_DOWN_HTC	
	**Description** This blendShape influences the muscles around the left eye, moving these muscles further downward with a higher value.

XR_EYE_EXPRESSION_RIGHT_DOWN_HTC	
	**Description** This blendShape influences the muscles around the right eye, moving these muscles further downward with a higher value.

XR_EYE_EXPRESSION_LEFT_OUT_HTC	
	**Description** This blendShape influences the muscles around the left eye, moving these muscles further leftward with a higher value.

XR_EYE_EXPRESSION_RIGHT_IN_HTC	
	**Description** This blendShape influences the muscles around the right eye, moving these muscles further leftward with a higher value.

XR_EYE_EXPRESSION_LEFT_IN_HTC	
	**Description** This blendShape influences the muscles around the left eye, moving these muscles further rightward with a higher value.

XR_EYE_EXPRESSION_RIGHT_OUT_HTC	
	**Description** This blendShape influences the muscles around the right eye, moving these muscles further rightward with a higher value.

XR_EYE_EXPRESSION_LEFT_UP_HTC	
	**Description** This blendShape influences the muscles around the left eye, moving these muscles further upward with a higher value.

XR_EYE_EXPRESSION_RIGHT_UP_HTC	
	**Description** This blendShape influences the muscles around the right eye, moving these muscles further upward with a higher value.

- **Lip Blend Shapes**

Through feeding the blend shape values of lip expression to an avatar, its facial expression can be

animated with the player's lip movement. The following pictures show how the facial expression acts on the avatar according to each set of lip blend shape values.

```
// Provided by XR_HTC_facial_tracking
typedef enum XrLipExpressionHTC {
    XR_LIP_EXPRESSION_JAW_RIGHT_HTC = 0,
    XR_LIP_EXPRESSION_JAW_LEFT_HTC = 1,
    XR_LIP_EXPRESSION_JAW_FORWARD_HTC = 2,
    XR_LIP_EXPRESSION_JAW_OPEN_HTC = 3,
    XR_LIP_EXPRESSION_MOUTH_APE_SHAPE_HTC = 4,
    XR_LIP_EXPRESSION_MOUTH_UPPER_RIGHT_HTC = 5,
    XR_LIP_EXPRESSION_MOUTH_UPPER_LEFT_HTC = 6,
    XR_LIP_EXPRESSION_MOUTH_LOWER_RIGHT_HTC = 7,
    XR_LIP_EXPRESSION_MOUTH_LOWER_LEFT_HTC = 8,
    XR_LIP_EXPRESSION_MOUTH_UPPER_OVERTURN_HTC = 9,
    XR_LIP_EXPRESSION_MOUTH_LOWER_OVERTURN_HTC = 10,
    XR_LIP_EXPRESSION_MOUTH_POUT_HTC = 11,
    XR_LIP_EXPRESSION_MOUTH_RAISER_RIGHT_HTC = 12,
    XR_LIP_EXPRESSION_MOUTH_RAISER_LEFT_HTC = 13,
    XR_LIP_EXPRESSION_MOUTH_STRETCHER_RIGHT_HTC = 14,
    XR_LIP_EXPRESSION_MOUTH_STRETCHER_LEFT_HTC = 15,
    XR_LIP_EXPRESSION_CHEEK_PUFF_RIGHT_HTC = 16,
    XR_LIP_EXPRESSION_CHEEK_PUFF_LEFT_HTC = 17,
    XR_LIP_EXPRESSION_CHEEK_SUCK_HTC = 18,
    XR_LIP_EXPRESSION_MOUTH_UPPER_UPRIGHT_HTC = 19,
    XR_LIP_EXPRESSION_MOUTH_UPPER_UPLEFT_HTC = 20,
    XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNRIGHT_HTC = 21,
    XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNLEFT_HTC = 22,
    XR_LIP_EXPRESSION_MOUTH_UPPER_INSIDE_HTC = 23,
    XR_LIP_EXPRESSION_MOUTH_LOWER_INSIDE_HTC = 24,
    XR_LIP_EXPRESSION_MOUTH_LOWER_OVERLAY_HTC = 25,
    XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC = 26,
    XR_LIP_EXPRESSION_TONGUE_LEFT_HTC = 27,
    XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC = 28,
    XR_LIP_EXPRESSION_TONGUE_UP_HTC = 29,
    XR_LIP_EXPRESSION_TONGUE_DOWN_HTC = 30,
    XR_LIP_EXPRESSION_TONGUE_ROLL_HTC = 31,
    XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC = 32,
    XR_LIP_EXPRESSION_TONGUE_UPRIGHT_MORPH_HTC = 33,
    XR_LIP_EXPRESSION_TONGUE_UPLEFT_MORPH_HTC = 34,
    XR_LIP_EXPRESSION_TONGUE_DOWNRIGHT_MORPH_HTC = 35,
    XR_LIP_EXPRESSION_TONGUE_DOWNLEFT_MORPH_HTC = 36,
  // Provided by XR_HTC_facial_tracking
    XR_LIP_EXPRESSION_MOUTH_SMILE_RIGHT_HTC = XR_LIP_EXPRESSION_MOUTH_RAISER_RIGHT_HTC,
  // Provided by XR_HTC_facial_tracking
    XR_LIP_EXPRESSION_MOUTH_SMILE_LEFT_HTC = XR_LIP_EXPRESSION_MOUTH_RAISER_LEFT_HTC,
  // Provided by XR_HTC_facial_tracking
```

```
    XR_LIP_EXPRESSION_MOUTH_SAD_RIGHT_HTC = XR_LIP_EXPRESSION_MOUTH_STRETCHER_RIGHT_HTC,
  // Provided by XR_HTC_facial_tracking
    XR_LIP_EXPRESSION_MOUTH_SAD_LEFT_HTC = XR_LIP_EXPRESSION_MOUTH_STRETCHER_LEFT_HTC,
    XR_LIP_EXPRESSION_MAX_ENUM_HTC = 0x7FFFFFFF
} XrLipExpressionHTC;
```

XR_LIP_EXPRESSION_JAW_LEFT_HTC	
	**Description** This blend shape moves the jaw further leftward with a higher value.

XR_LIP_EXPRESSION_JAW_RIGHT_HTC	
	**Description** This blend shape moves the jaw further rightward with a higher value.

XR_LIP_EXPRESSION_JAW_FORWARD_HTC	
	**Description** This blend shape moves the jaw forward with a higher value.

XR_LIP_EXPRESSION_JAW_OPEN_HTC	
	**Description** This blend shape opens the mouth further with a higher value.

XR_LIP_EXPRESSION_MOUTH_APE_SHAPE_HTC	
	**Description** This blend shape stretches the jaw further with a higher value.

XR_LIP_EXPRESSION_MOUTH_UPPER_LEFT_HTC	
	**Description** This blend shape moves your upper lip leftward.

XR_LIP_EXPRESSION_MOUTH_UPPER_RIGHT_HTC	
	**Description** This blend shape moves your upper lip rightward.

`XR_LIP_EXPRESSION_MOUTH_LOWER_LEFT_HTC`

Description
This blend shape moves your lower lip leftward.

`XR_LIP_EXPRESSION_MOUTH_LOWER_RIGHT_HTC`

Description
This blend shape moves your lower lip rightward.

`XR_LIP_EXPRESSION_MOUTH_UPPER_OVERTURN_HTC`

Description
This blend shape pouts your upper lip. Can be used with `XR_LIP_EXPRESSION_MOUTH_UPPER_UPRIGHT_HTC` and `XR_LIP_EXPRESSION_MOUTH_UPPER_UPLEFT_HTC` to complete upper O mouth shape.

`XR_LIP_EXPRESSION_MOUTH_LOWER_OVERTURN_HTC`

Description
This blend shape pouts your lower lip. Can be used with `XR_LIP_EXPRESSION_MOUTH_UPPER_UPRIGHT_HTC` and `XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNRIGHT_HTC` to complete upper O mouth shape.

XR_LIP_EXPRESSION_MOUTH_POUT_HTC	
	**Description** This blend shape allows the lips to pout more with a higher value.

XR_LIP_EXPRESSION_MOUTH_RAISER_LEFT_HTC	
	**Description** This blend shape raises the left side of the mouth further with a higher value.

XR_LIP_EXPRESSION_MOUTH_RAISER_RIGHT_HTC	
	**Description** This blend shape raises the right side of the mouth further with a higher value.

XR_LIP_EXPRESSION_MOUTH_STRETCHER_LEFT_HTC	
	**Description** This blend shape lowers the left side of the mouth further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_STRETCHER_RIGHT_HTC`

Description
This blend shape lowers the right side of the mouth further with a higher value.

`XR_LIP_EXPRESSION_CHEEK_PUFF_RIGHT_HTC`

Description
This blend shape puffs up the right side of the cheek further with a higher value.

`XR_LIP_EXPRESSION_CHEEK_PUFF_LEFT_HTC`

Description
This blend shape puffs up the left side of the cheek further with a higher value.

`XR_LIP_EXPRESSION_CHEEK_SUCK_HTC`

Description
This blend shape sucks in the cheeks on both sides further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_UPPER_UPLEFT_HTC`

Description
This blend shape raises the left upper lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_UPPER_UPRIGHT_HTC`

Description
This blend shape raises the right upper lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNLEFT_HTC`

Description
This blend shape lowers the left lower lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNRIGHT_HTC`

Description
This blend shape lowers the right lower lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_LOWER_INSIDE_HTC`

Description
This blend shape rolls in the lower lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_UPPER_INSIDE_HTC`

Description
This blend shape rolls in the upper lip further with a higher value.

`XR_LIP_EXPRESSION_MOUTH_LOWER_OVERLAY_HTC`

Description
This blend shape stretches the lower lip further and lays it on the upper lip further with a higher value.

`XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC`

Description
This blend shape sticks the tongue out slightly.
In step 1 of extending the tongue, the main action of the tongue is to lift up, and the elongated length only extends to a little bit beyond the teeth.

XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC	
	**Description** This blend shape sticks the tongue out extremely. Continuing the step 1, it extends the tongue to the longest.

XR_LIP_EXPRESSION_TONGUE_DOWN_HTC	
	**Description** This blend shape sticks the tongue out and down extremely. This example contains (XR_LIP_EXPRESSION_TONGUE_DOWN_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC).

XR_LIP_EXPRESSION_TONGUE_UP_HTC	
	**Description** This blend shape sticks the tongue out and up extremely. This example contains (XR_LIP_EXPRESSION_TONGUE_UP_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC).

XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC	
	**Description** This blend shape sticks the tongue out and right extremely. This example contains (XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC).

XR_LIP_EXPRESSION_TONGUE_LEFT_HTC	
	**Description** This blend shape sticks the tongue out and left extremely. This example contains (XR_LIP_EXPRESSION_TONGUE_LEFT_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC).

XR_LIP_EXPRESSION_TONGUE_ROLL_HTC	
	**Description** This blend shape sticks the tongue out with roll type. This example contains (XR_LIP_EXPRESSION_TONGUE_ROLL_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC).

XR_LIP_EXPRESSION_TONGUE_UPRIGHT_MORPH_HTC	
	**Description** This blend shape does not make sense. When both the right and up blend shapes appear at the same time, the tongue will be deformed. (XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC XR_LIP_EXPRESSION_TONGUE_UP_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC)

XR_LIP_EXPRESSION_TONGUE_UPRIGHT_MORPH_HTC	
	**Description** This blend shape fixes the deformation illustrated above. (XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC XR_LIP_EXPRESSION_TONGUE_UP_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC + XR_LIP_EXPRESSION_TONGUE_UPRIGHT_MORPH_HTC)

XR_LIP_EXPRESSION_TONGUE_UPLEFT_MORPH_HTC	
	**Description** This blend shape does not make sense. When both the left and up blend shapes appear at the same time, the tongue will be deformed. (XR_LIP_EXPRESSION_TONGUE_LEFT_HTC XR_LIP_EXPRESSION_TONGUE_UP_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC)
	**Description** This blend shape fixes the deformation illustrated above. (XR_LIP_EXPRESSION_TONGUE_LEFT_HTC XR_LIP_EXPRESSION_TONGUE_UP_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC + XR_LIP_EXPRESSION_TONGUE_UPLEFT_MORPH_HTC)

XR_LIP_EXPRESSION_TONGUE_DOWNRIGHT_MORPH_HTC	
	**Description** This blend shape does not make sense. When both the right and down blend shapes appear at the same time, the tongue will be deformed. (XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC XR_LIP_EXPRESSION_TONGUE_DOWN_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC)
	**Description** This blend shape fixes the deformation illustrated above. (XR_LIP_EXPRESSION_TONGUE_RIGHT_HTC XR_LIP_EXPRESSION_TONGUE_DOWN_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC + XR_LIP_EXPRESSION_TONGUE_DOWNRIGHT_MORPH_HTC)

XR_LIP_EXPRESSION_TONGUE_DOWNLEFT_MORPH_HTC	
	**Description** This blend shape does not make sense. When both the left and down blend shapes appear at the same time, the tongue will be deformed. (XR_LIP_EXPRESSION_TONGUE_LEFT_HTC XR_LIP_EXPRESSION_TONGUE_DOWN_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC)

XR_LIP_EXPRESSION_TONGUE_DOWNLEFT_MORPH_HTC	
	**Description** This blend shape fixes the deformation illustrated above. (XR_LIP_EXPRESSION_TONGUE_LEFT_HTC XR_LIP_EXPRESSION_TONGUE_DOWN_HTC + XR_LIP_EXPRESSION_TONGUE_LONGSTEP1_HTC XR_LIP_EXPRESSION_TONGUE_LONGSTEP2_HTC + XR_LIP_EXPRESSION_TONGUE_DOWNLEFT_MORPH_HTC)

O shape	
	**Description** The entire O-shaped mouth is formed by the combination of 6 blend shapes: (XR_LIP_EXPRESSION_MOUTH_UPPER_OVERTURN_HTC XR_LIP_EXPRESSION_MOUTH_LOWER_OVERTURN_HTC XR_LIP_EXPRESSION_MOUTH_UPPER_UPLEFT_HTC XR_LIP_EXPRESSION_MOUTH_UPPER_UPRIGHT_HTC XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNLEFT_HTC XR_LIP_EXPRESSION_MOUTH_LOWER_DOWNRIGHT_HTC)

New Object Types

- XrFacialTrackerHTC

New Flag Types

New Enum Constants

XrObjectType enumeration is extended with:

- XR_OBJECT_TYPE_FACIAL_TRACKER_HTC

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_FACIAL_TRACKING_PROPERTIES_HTC

- XR_TYPE_FACIAL_TRACKER_CREATE_INFO_HTC
- XR_TYPE_FACIAL_EXPRESSIONS_HTC

New Enums

- XrFacialTrackingTypeHTC
- XrEyeExpressionHTC
- XrLipExpressionHTC

New Structures

Overview

This extension enables an application to gain rendering performance improvement by reducing the pixel density of areas in the peripheral vision. The areas near the focal point still sustains the original pixel density than periphery.

The application **can** use this extension in the following steps:

1. Create an XrFoveationApplyInfoHTC structure with the desired foveation configurations.
2. Apply the foveation configuration by calling xrApplyFoveationHTC with desired XrFoveationApplyInfoHTC.

Note

This extension is recommended for XrSession whose XrViewConfigurationType is `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_STEREO`.

Operate foveated rendering

The application **can** operate foveated rendering by calling xrApplyFoveationHTC with the corresponding foveation configuration and the specified XrSwapchainSubImage.

The xrApplyFoveationHTC function is defined as:

```
// Provided by XR_HTC_foveation
XrResult xrApplyFoveationHTC(
    XrSession                                   session,
    const XrFoveationApplyInfoHTC*              applyInfo);
```

Parameter Descriptions

- `session` is a handle to an XrSession in which the foveation will apply to.
- `applyInfo` is a pointer to an XrFoveationApplyInfoHTC structure containing information about the foveation configuration and applied XrSwapchainSubImage.

The foveation configuration will be applied after this call, and the state will persist until the next call to xrApplyFoveationHTC or the end of this XrSession, whichever comes first. You **should** not call xrApplyFoveationHTC during rendering to target image layer XrSwapchainSubImage in render loop.

Valid Usage (Implicit)

- The `XR_HTC_foveation` extension **must** be enabled prior to calling xrApplyFoveationHTC
- `session` **must** be a valid XrSession handle
- `applyInfo` **must** be a pointer to a valid XrFoveationApplyInfoHTC structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrFoveationApplyInfoHTC structure is defined as:

```
// Provided by XR_HTC_foveation
typedef struct XrFoveationApplyInfoHTC {
    XrStructureType         type;
    const void*             next;
    XrFoveationModeHTC      mode;
    uint32_t                subImageCount;
    XrSwapchainSubImage*    subImages;
} XrFoveationApplyInfoHTC;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- mode is an XrFoveationModeHTC enum describing the foveation mode.
- subImageCount is the count of subImages in the subImages array. This **must** be equal to the number of view poses returned by xrLocateViews.
- subImages is an array of XrSwapchainSubImage to apply foveated rendering.

The application **should** set the following configurations in XrFoveationApplyInfoHTC:

- The foveation mode to be applied.

- The specified XrSwapchainSubImage to the corresponding view.

The XrSwapchain::faceCount of the swapchain in XrSwapchainSubImage **must** be 1 since this extension does not support cubemaps.

If mode is XR_FOVEATION_MODE_DYNAMIC_HTC, the next chain for this structure **must** include XrFoveationDynamicModeInfoHTC structure.

If mode is XR_FOVEATION_MODE_CUSTOM_HTC, the next chain for this structure **must** include XrFoveationCustomModeInfoHTC structure.

The order of subImages **must** be the same order as in XrCompositionLayerProjectionView when submitted in xrEndFrame.

Valid Usage (Implicit)

- The XR_HTC_foveation extension **must** be enabled prior to using XrFoveationApplyInfoHTC
- type **must** be XR_TYPE_FOVEATION_APPLY_INFO_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrFoveationCustomModeInfoHTC, XrFoveationDynamicModeInfoHTC
- mode **must** be a valid XrFoveationModeHTC value
- subImages **must** be a pointer to an array of subImageCount XrSwapchainSubImage structures
- The subImageCount parameter **must** be greater than 0

XrFoveationModeHTC identifies the different foveation modes.

```
// Provided by XR_HTC_foveation
typedef enum XrFoveationModeHTC {
    XR_FOVEATION_MODE_DISABLE_HTC = 0,
    XR_FOVEATION_MODE_FIXED_HTC = 1,
    XR_FOVEATION_MODE_DYNAMIC_HTC = 2,
    XR_FOVEATION_MODE_CUSTOM_HTC = 3,
    XR_FOVEATION_MODE_MAX_ENUM_HTC = 0x7FFFFFFF
} XrFoveationModeHTC;
```

Enumerant Descriptions

- `XR_FOVEATION_MODE_DISABLE_HTC` — No foveation
- `XR_FOVEATION_MODE_FIXED_HTC` — Apply system default setting with fixed clear FOV and periphery quality.
- `XR_FOVEATION_MODE_DYNAMIC_HTC` — Allow system to set foveation dynamically according realtime system metric or other extensions.
- `XR_FOVEATION_MODE_CUSTOM_HTC` — Allow application to set foveation with desired clear FOV, periphery quality, and focal center offset.

Dynamic foveation mode

The application allows runtime to configure the foveation settings dynamically according to the system metrics or other extensions.

The XrFoveationDynamicModeInfoHTC structure is defined as:

```
// Provided by XR_HTC_foveation
typedef struct XrFoveationDynamicModeInfoHTC {
    XrStructureType               type;
    const void*                   next;
    XrFoveationDynamicFlagsHTC    dynamicFlags;
} XrFoveationDynamicModeInfoHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `dynamicFlags` is a bitmask of XrFoveationDynamicFlagBitsHTC indicated which item **may** be changed during dynamic mode.

The application **must** chain an XrFoveationDynamicModeInfoHTC structure to XrFoveationApplyInfoHTC if dynamic mode is set.

Valid Usage (Implicit)

- The XR_HTC_foveation extension **must** be enabled prior to using XrFoveationDynamicModeInfoHTC
- type **must** be XR_TYPE_FOVEATION_DYNAMIC_MODE_INFO_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- dynamicFlags **must** be 0 or a valid combination of XrFoveationDynamicFlagBitsHTC values

```
// Provided by XR_HTC_foveation
typedef XrFlags64 XrFoveationDynamicFlagsHTC;
```

```
// Provided by XR_HTC_foveation
// Flag bits for XrFoveationDynamicFlagsHTC
static const XrFoveationDynamicFlagsHTC XR_FOVEATION_DYNAMIC_LEVEL_ENABLED_BIT_HTC =
0x00000001;
static const XrFoveationDynamicFlagsHTC XR_FOVEATION_DYNAMIC_CLEAR_FOV_ENABLED_BIT_HTC =
0x00000002;
static const XrFoveationDynamicFlagsHTC
XR_FOVEATION_DYNAMIC_FOCAL_CENTER_OFFSET_ENABLED_BIT_HTC = 0x00000004;
```

Flag Descriptions

- XR_FOVEATION_DYNAMIC_LEVEL_ENABLED_BIT_HTC — Allow system to set periphery pixel density dynamically.
- XR_FOVEATION_DYNAMIC_CLEAR_FOV_ENABLED_BIT_HTC — Allow system to set clear FOV degree dynamically.
- XR_FOVEATION_DYNAMIC_FOCAL_CENTER_OFFSET_ENABLED_BIT_HTC — Allow system to set focal center offset dynamically.

Custom foveation mode

The application **can** configure the foveation settings according to the preference of content.

The XrFoveationCustomModeInfoHTC structure is defined as:

```
// Provided by XR_HTC_foveation
typedef struct XrFoveationCustomModeInfoHTC {
    XrStructureType                         type;
    const void*                             next;
    uint32_t                                configCount;
    const XrFoveationConfigurationHTC*      configs;
} XrFoveationCustomModeInfoHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `configCount` is a `uint32_t` describing the count of elements in the `configs` array, which **must** be the number of views.
- `configs` is an array of XrFoveationConfigurationHTC structure contains the custom foveation settings for the corresponding views.

The application **must** chain an XrFoveationCustomModeInfoHTC structure to XrFoveationApplyInfoHTC to customize foveation if custom mode is set.

Valid Usage (Implicit)

- The `XR_HTC_foveation` extension **must** be enabled prior to using XrFoveationCustomModeInfoHTC
- `type` **must** be `XR_TYPE_FOVEATION_CUSTOM_MODE_INFO_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `configs` **must** be a pointer to an array of `configCount` valid XrFoveationConfigurationHTC structures
- The `configCount` parameter **must** be greater than `0`

The XrFoveationConfigurationHTC structure is defined as:

```
// Provided by XR_HTC_foveation
typedef struct XrFoveationConfigurationHTC {
    XrFoveationLevelHTC    level;
    float                  clearFovDegree;
    XrVector2f             focalCenterOffset;
} XrFoveationConfigurationHTC;
```

Member Descriptions

- `level` is the pixel density drop level of periphery area specified by XrFoveationLevelHTC .
- `clearFovDegree` is the value indicating the total horizontal and vertical field angle with the original pixel density level. `clearFovDegree` **must** be specified in degree, and **must** be in the range [0, 180].
- `focalCenterOffset` is the desired center offset of the field of view in NDC(normalized device coordinates) space. The x and y of `focalCenterOffset` **must** be in the range [-1, 1].

Valid Usage (Implicit)

- The `XR_HTC_foveation` extension **must** be enabled prior to using XrFoveationConfigurationHTC
- `level` **must** be a valid XrFoveationLevelHTC value

```
// Provided by XR_HTC_foveation
typedef enum XrFoveationLevelHTC {
    XR_FOVEATION_LEVEL_NONE_HTC = 0,
    XR_FOVEATION_LEVEL_LOW_HTC = 1,
    XR_FOVEATION_LEVEL_MEDIUM_HTC = 2,
    XR_FOVEATION_LEVEL_HIGH_HTC = 3,
    XR_FOVEATION_LEVEL_MAX_ENUM_HTC = 0x7FFFFFFF
} XrFoveationLevelHTC;
```

Enumerant Descriptions

- `XR_FOVEATION_LEVEL_NONE_HTC` — No foveation
- `XR_FOVEATION_LEVEL_LOW_HTC` — Light periphery pixel density drop and lower performance gain.
- `XR_FOVEATION_LEVEL_MEDIUM_HTC` — Medium periphery pixel density drop and medium performance gain
- `XR_FOVEATION_LEVEL_HIGH_HTC` — Heavy periphery pixel density drop and higher performance gain

Overview

This extension defines a new interaction profile for tracked hands.

Hand interaction profile

Interaction profile path:

- */interaction_profiles/htc/hand_interaction*

> **Note**
>
> The interaction profile path */interaction_profiles/htc/hand_interaction* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/htc/hand_interaction_htc*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for user paths:

- */user/hand_htc/left*
- */user/hand_htc/right*

This interaction profile represents basic pose and actions for interaction of tracked hands.

Supported component paths for far interaction:

- *.../input/select/value*
- *.../input/aim/pose*

The application **should** use *.../input/aim/pose* path to aim at objects in the world and use *.../input/select/value* path to decide user selection from pinch shape strength which the range of value is `0.0f` to `1.0f`, with `1.0f` meaning pinch fingers touched.

Supported component paths for near interaction:

- *.../input/squeeze/value*
- *.../input/grip/pose*

The application **should** use *.../input/grip/pose* path to interact with the nearby objects and locate the position of handheld objects, and use *.../input/squeeze/value* path to decide the hand picking up or holding the nearby objects from grip shape strength which the range of value is `0.0f` to `1.0f`, with `1.0f` meaning hand grip shape is closed.

Note

Far and near interaction depends on the support capabilities of hand tracking engine. The application **can** check isActive of XrActionStatePose of aim and grip to know far and near interaction supported or not then decide the interaction behavior in content.

Overview

This extension enables an application to show the passthrough image to see the surrounding environment from the VR headset. The application is allowed to configure the passthrough image with the different appearances according to the demand of the application.

The passthrough configurations that runtime provides to applications contain:

- Decide the passthrough layer shown over or under the frame submitted by the application.
- Specify the passthrough form with full of the entire screen or projection onto the mesh specified by the application.
- Set the alpha blending level for the composition of the passthrough layer.

Create a passthrough handle

An application **can** create an XrPassthroughHTC handle by calling xrCreatePassthroughHTC. The returned passthrough handle **can** be subsequently used in API calls.

```
// Provided by XR_HTC_passthrough
XR_DEFINE_HANDLE(XrPassthroughHTC)
```

The xrCreatePassthroughHTC function is defined as:

```
// Provided by XR_HTC_passthrough
XrResult xrCreatePassthroughHTC(
    XrSession                                   session,
    const XrPassthroughCreateInfoHTC*           createInfo,
    XrPassthroughHTC*                           passthrough);
```

Parameter Descriptions

- `session` is an XrSession in which the passthrough will be active.
- `createInfo` is a pointer to an XrPassthroughCreateInfoHTC structure containing information about how to create the passthrough.
- `passthrough` is a pointer to a handle in which the created XrPassthroughHTC is returned.

Creates an XrPassthroughHTC handle.

If the function successfully returned, the output `passthrough` **must** be a valid handle.

Valid Usage (Implicit)

- The `XR_HTC_passthrough` extension **must** be enabled prior to calling xrCreatePassthroughHTC
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrPassthroughCreateInfoHTC structure
- `passthrough` **must** be a pointer to an XrPassthroughHTC handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrPassthroughCreateInfoHTC structure is defined as:

```
// Provided by XR_HTC_passthrough
typedef struct XrPassthroughCreateInfoHTC {
    XrStructureType         type;
    const void*             next;
    XrPassthroughFormHTC    form;
} XrPassthroughCreateInfoHTC;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- form XrPassthroughFormHTC that specifies the form of passthrough.

Valid Usage (Implicit)

- The XR_HTC_passthrough extension **must** be enabled prior to using XrPassthroughCreateInfoHTC
- `type` **must** be `XR_TYPE_PASSTHROUGH_CREATE_INFO_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `form` **must** be a valid XrPassthroughFormHTC value

The XrPassthroughFormHTC enumeration identifies the form of the passthrough, presenting the passthrough fill the full screen or project onto a specified mesh.

```
// Provided by XR_HTC_passthrough
typedef enum XrPassthroughFormHTC {
    XR_PASSTHROUGH_FORM_PLANAR_HTC = 0,
    XR_PASSTHROUGH_FORM_PROJECTED_HTC = 1,
    XR_PASSTHROUGH_FORM_MAX_ENUM_HTC = 0x7FFFFFFF
} XrPassthroughFormHTC;
```

Enumerant Descriptions

- `XR_PASSTHROUGH_FORM_PLANAR_HTC` — Presents the passthrough with full of the entire screen.
- `XR_PASSTHROUGH_FORM_PROJECTED_HTC` — Presents the passthrough projecting onto a custom mesh.

The xrDestroyPassthroughHTC function is defined as:

```
// Provided by XR_HTC_passthrough
XrResult xrDestroyPassthroughHTC(
    XrPassthroughHTC                            passthrough);
```

Parameter Descriptions

- `passthrough` is the XrPassthroughHTC to be destroyed.

The xrDestroyPassthroughHTC function releases the passthrough and the underlying resources.

Valid Usage (Implicit)

- The XR_HTC_passthrough extension **must** be enabled prior to calling xrDestroyPassthroughHTC
- passthrough **must** be a valid XrPassthroughHTC handle

Thread Safety

- Access to passthrough, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Composite the passthrough layer

The XrCompositionLayerPassthroughHTC structure is defined as:

```
// Provided by XR_HTC_passthrough
typedef struct XrCompositionLayerPassthroughHTC {
    XrStructureType            type;
    const void*                next;
    XrCompositionLayerFlags    layerFlags;
    XrSpace                    space;
    XrPassthroughHTC           passthrough;
    XrPassthroughColorHTC      color;
} XrCompositionLayerPassthroughHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain, such as XrPassthroughMeshTransformInfoHTC.
- `layerFlags` is a bitmask of XrCompositionLayerFlagBits describing flags to apply to the layer.
- `space` is the XrSpace that specifies the layer's space - **must** be XR_NULL_HANDLE.
- `passthrough` is the XrPassthroughHTC previously created by xrCreatePassthroughHTC.
- `color` is the XrPassthroughColorHTC describing the color information with the alpha value of the passthrough layer.

The application **can** create an XrCompositionLayerPassthroughHTC structure with the created `passthrough` and the corresponding information. A pointer to XrCompositionLayerPassthroughHTC **may** be submitted in xrEndFrame as a pointer to the base structure XrCompositionLayerBaseHeader, in the desired layer order, to request the runtime to composite a passthrough layer into the final frame output.

If the passthrough form specified to xrCreatePassthroughHTC is `XR_PASSTHROUGH_FORM_PROJECTED_HTC`, XrPassthroughMeshTransformInfoHTC **must** appear in the `next` chain. If they are absent, the runtime **must** return error `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_HTC_passthrough` extension **must** be enabled prior to using XrCompositionLayerPassthroughHTC
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_PASSTHROUGH_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrPassthroughMeshTransformInfoHTC
- `layerFlags` **must** be a valid combination of XrCompositionLayerFlagBits values
- `layerFlags` **must** not be `0`
- `space` **must** be a valid XrSpace handle
- `passthrough` **must** be a valid XrPassthroughHTC handle
- `color` **must** be a valid XrPassthroughColorHTC structure
- Both of `passthrough` and `space` **must** have been created, allocated, or retrieved from the same XrSession

The XrPassthroughColorHTC structure is defined as:

```
// Provided by XR_HTC_passthrough
typedef struct XrPassthroughColorHTC {
    XrStructureType    type;
    const void*        next;
    float              alpha;
} XrPassthroughColorHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `alpha` is the alpha value of the passthrough in the range [0, 1].

The application **can** specify the XrPassthroughColorHTC to adjust the alpha value of the passthrough. The range is between 0.0f and 1.0f, 1.0f means opaque.

Valid Usage (Implicit)

- The `XR_HTC_passthrough` extension **must** be enabled prior to using XrPassthroughColorHTC
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_HTC`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrPassthroughMeshTransformInfoHTC structure is defined as:

```
// Provided by XR_HTC_passthrough
typedef struct XrPassthroughMeshTransformInfoHTC {
    XrStructureType      type;
    const void*          next;
    uint32_t             vertexCount;
    const XrVector3f*    vertices;
    uint32_t             indexCount;
    const uint32_t*      indices;
    XrSpace              baseSpace;
    XrTime               time;
    XrPosef              pose;
    XrVector3f           scale;
} XrPassthroughMeshTransformInfoHTC;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `vertexCount` is the count of vertices array in the mesh.
- `vertices` is an array of XrVector3f. The size of the array **must** be equal to vertexCount.
- `indexCount` is the count of indices array in the mesh.
- `indices` is an array of triangle indices. The size of the array **must** be equal to indexCount.
- `baseSpace` is the XrSpace that defines the projected passthrough's base space for transformations.
- `time` is the `XrTime` that defines the time at which the transform is applied.
- `pose` is the XrPosef that defines the pose of the mesh
- `scale` is the XrVector3f that defines the scale of the mesh

The XrPassthroughMeshTransformInfoHTC structure describes the mesh and transformation.

The application **must** specify the XrPassthroughMeshTransformInfoHTC in the `next` chain of XrCompositionLayerPassthroughHTC if the specified form of passthrough layer previously created by xrCreatePassthroughHTC is `XR_PASSTHROUGH_FORM_PROJECTED_HTC`.

Passing XrPassthroughMeshTransformInfoHTC updates the projected mesh information in the runtime for passthrough layer composition.

If XrPassthroughMeshTransformInfoHTC is not set correctly, runtime **must** return error `XR_ERROR_VALIDATION_FAILURE` when xrEndFrame is called with composition layer XrCompositionLayerPassthroughHTC.

Valid Usage (Implicit)

- The XR_HTC_passthrough extension **must** be enabled prior to using XrPassthroughMeshTransformInfoHTC
- type **must** be XR_TYPE_PASSTHROUGH_MESH_TRANSFORM_INFO_HTC
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- vertices **must** be a pointer to an array of vertexCount XrVector3f structures
- indices **must** be a pointer to an array of indexCount uint32_t values
- baseSpace **must** be a valid XrSpace handle
- The vertexCount parameter **must** be greater than 0
- The indexCount parameter **must** be greater than 0

Overview

This extension provides an `XrPath` for getting device input from a VIVE wrist tracker to enable its

interactions. VIVE wrist tracker is a tracked device mainly worn on user's wrist for pose tracking. Besides this use case, user also can tie it to a physical object to track its object pose, e.g. tie on a gun.

VIVE Wrist Tracker input

This extension exposes a new interaction profile path */interaction_profiles/htc/vive_wrist_tracker* that is valid for the user path

- */user/wrist_htc/left*
- */user/wrist_htc/right*

with supported input subpaths

- On */user/wrist_htc/left* only:
  - *.../input/menu/click*
  - *.../input/x/click*
- On */user/wrist_htc/right* only:
  - *.../input/system/click* (**may** not be available for application use)
  - *.../input/a/click*
- *.../input/entity_htc/pose*

> **Note**
>
> The interaction profile path */interaction_profiles/htc/vive_wrist_tracker* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/htc/vive_wrist_tracker_htc*, to allow for modifications when promoted to a KHR extension or the core specification.

The entity_htc pose allows the applications to recognize the origin of a tracked input device, especially for the wearable devices which are not held in the user's hand. The entity_htc pose is defined as follows:

- The entity position: The center position of the tracked device.
- The entity orientation: Oriented with +Y up, +X to the right, and -Z forward.

Overview

This extension defines a new interaction profile for the Huawei Controller, including but not limited to Huawei VR Glasses Controller.

Huawei Controller interaction profile

Interaction profile path:

- */interaction_profiles/huawei/controller*

> **Note**
>
> The interaction profile path */interaction_profiles/huawei/controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/huawei/controller_huawei*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

This interaction profile represents the input sources and haptics on the Huawei Controller.

Supported component paths:

- *.../input/home/click*
- *.../input/back/click*
- *.../input/volume_up/click*
- *.../input/volume_down/click*
- *.../input/trigger/value*
- *.../input/trigger/click*
- *.../input/trackpad/x*
- *.../input/trackpad/y*
- *.../input/trackpad/click*
- *.../input/trackpad/touch*
- *.../input/aim/pose*
- *.../input/grip/pose*
- *.../output/haptic*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

Overview

This extension defines a new interaction profile for the Logitech MX Ink, a 6-DOF tracked stylus.

12.141.1. Logitech MX Ink Stylus Interaction Profile

Interaction profile path:

- */interaction_profiles/logitech/mx_ink_stylus_logitech*

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

This interaction profile provides inputs and outputs for a 6-DOF tracked controller shaped as a stylus. This controller allows for writing/sketching on 2D surfaces using an analog force sensor at the tip. In addition to the tip, the controller has an input cluster composed of three buttons. The middle button features a force sensor. The front and back buttons provide two different inputs: click and double tap detection. Double tap events are treated as virtual buttons. The stylus also includes a system button, situated at the rear end of the device.

Supported component paths:

- *.../input/system/click* (**may** not be available for application use)
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../input/cluster_front_logitech/click*
- *.../input/cluster_front_logitech/double_tap_logitech*
- *.../input/cluster_middle_logitech/force*
- *.../input/cluster_back_logitech/click*
- *.../input/cluster_back_logitech/double_tap_logitech*
- *.../input/dock_logitech/docked_logitech*
- *.../input/tip_logitech/force*
- *.../input/tip_logitech/pose*
- *.../output/haptic*

12.141.2. New Identifiers and Components

New Identifiers

- **tip_logitech**: The Logitech MX Ink Stylus features a pressure-sensitive tip. Its usage is intended to be primarily drawing/writing applications, along with other forms of close interaction. This pose corresponds to the position and orientation of the stylus **tip**. The origin of the local coordinate system is the sharpest point of the **tip**. The Z axis aligns with the main axis of the stylus, with -Z extending outward from the tip. The X axis points to the right, while the direction of the Y axis aligns with the surface normal of the input cluster.
- **cluster_front_logitech**: This is the front button (closest to the stylus tip) in the input cluster of the controller. Its usage is intended to be similar to *.../input/squeeze/click* on other controllers.
- **cluster_middle_logitech**: The middle button in the input cluster measures pressure/force levels. Its usage is intended to be controlling in-air drawing (together with "tip_logitech"), selection, and generic interactions, similar to the trigger in other XR controllers.
- **cluster_back_logitech**: This is the third button in the device input cluster, furthest from the tip. Usage of the click interaction with this button is intended to be similar to the A button on other controllers. Usage of the double tap input is intended to be similar to the B button on other controllers.
- **dock_logitech**: The Logitech MX Ink Stylus is associated with a docking station for battery charging when not in use. It is expected that users will frequently switch between the MX Ink stylus and hand tracking or other controller.

New Components

- **docked_logitech**: Boolean input component. This component becomes true when placed in the dock, immediately before the device becomes inactive and stops being tracked. A recommended usage pattern is to monitor this component to become true, then locate the device at the associated "last change" timestamp. This allows retrieving the last known position for display purposes, making it easier for the user to pick up again when needed.
- **double_tap_logitech**: Boolean input component. Double tap gesture detection intended for usage as a virtual button. The three buttons in the input cluster have capacitive sensors. However, to reduce complexity and standardize the UX, 'single' tap gestures are not exposed in this interaction profile. A tap event is when the user makes brief contact with the button surface and lifts their finger within a predefined time window. A double tap consists of two single taps performed in succession, where the time interval between the two taps does not exceed a maximum threshold. Time intervals are user-defined and managed at the platform level. The goal is to unify the UX and free developers from having to implement their own double tap detection algorithm.

Types of Holds

The device associated with this interaction profile is a stylus, and thus affords two basic ways to hold and use it. The device does **not** sense which hold is in use, but some pose input subpaths only make sense in the context of one of the two holds. Application developers **should** consider which hold is expected in a given setting when designing suggested bindings.

A "precise grip" is a pencil-like hold allowing precision control using the arm, wrist, hand, and fingers. A precise grip is the primary hold encouraged by the affordances of the device design. It provides fine control over close interaction. While the stylus shape allows several orientations of this hold about the major axis of the device, the design intent is for the control cluster buttons to be accessible to the index finger and/or thumb while maintaining a precise grip.

A "power grip", by contrast, is a closed-fist hold, providing more coarse control using the arm and wrist. The control cluster buttons **may** be inaccessible when a user is employing a power grip. This is a secondary method of using the device. Most other XR controllers with interaction profiles in this specification are designed primarily for a power grip, and the "grip" standard pose identifier is intended to be a power grip in all of those profiles.

- *.../input/tip_logitech/pose* is intended for close selection, interaction, and drawing. This pose input subpath is referenced to the physical hardware rather than an assumed or designed hold. Therefore, its pose is meaningful in **both precise grip and power grip**. However, it also serves as the primary interaction pose for close-range use in the precise grip.
- *.../input/aim/pose* is intended for selection and interaction at a distance according to platform conventions. When used with this interaction profile, the position and orientation of this subpath relative to the device assumes a **precise grip**. This pose input subpath is not necessarily suitable for use with a power grip.
- *.../input/grip/pose* in this interaction profile is for close, coarse interaction while using a **power grip**, or virtual tool/object holding in a power grip. The relative pose of this subpath is based on the design intent for holding in a power grip. Be aware that due to the shape of the device, a user's actual power grip **may** easily vary from the design intent by a rotation about the Z axis, as well as translation along it. As such, inferring hand position and orientation from this pose is not recommended. Discouraged from use when a precise grip is anticipated, as this pose has very little to no meaningful relationship to the device or the user's hand in a precise grip.
- *.../input/grip_surface/pose* (when available — see `XR_KHR_maintenance1` or `XR_VERSION_1_1`) in this interaction profile is established assuming a **power grip**, holding the stylus against the palm in a closed fist. The predecessor of this input subpath, *.../input/palm_ext/pose*, is identically established, when available (see `XR_EXT_palm_pose`). The descriptions of positions and axes in the "grip_surface" standard pose identifier definition are **not** valid when the device is held in a precise grip rather than a power grip.
- *.../input/poke_ext/pose* and *.../input/pinch_ext/pose* (when available — see `XR_EXT_hand_interaction`) in this interaction profile are established assuming a **precise grip** interacting using the stylus tip. Discouraged from use when a power grip is anticipated.
    - NB: The device associated with this interaction profile also supports use through the

/interaction_profile/ext/hand_interaction interaction profile provided by `XR_EXT_hand_interaction`.

Designing Suggesting Bindings

The table below provides recommended translations for suggested interaction bindings from other controllers to this interaction profile, serving as a starting point for development.

As this controller is ambidextrous, the runtime **should** provide a platform settings method to select the stylus handedness and map the input paths for the A/B and X/Y buttons according to the current handedness.

The runtime **may** provide a platform settings method to define on which button the double tap events will be detected, and which virtual button it is mapped to. It is recommended to suggest binding a single action to both double tap subpaths for consistent behavior regardless of user settings.

Input subpath on common controller designs	**Recommended input subpath to suggest when using with** */interaction_profiles/logitech/mx_ink_stylus_logitech*
.../input/squeeze/click	*.../input/cluster_front_logitech/click*
.../input/trigger/value	*.../input/cluster_middle_logitech/force*
.../input/a/click	*.../input/cluster_back_logitech/click*
.../input/b/click	*.../input/cluster_back_logitech/double_tap_logitech* or *.../input/cluster_front_logitech/double_tap_logitech*
.../input/x/click	*.../input/cluster_back_logitech/click*
.../input/y/click	*.../input/cluster_back_logitech/double_tap_logitech* or *.../input/cluster_front_logitech/double_tap_logitech*

Overview

This extension defines a new flag in XrCompositionLayerSettingsFlagBitsFB that allows applications to provide a hint to the runtime to automatically toggle a layer filtering mechanism. The layer filtering helps alleviate visual quality artifacts such as blur and flicker.

Note: The runtime **may** use any factors it wishes to apply a filter to the layer. These **may** include not only fixed factors such as screen resolution, HMD type, and swapchain resolution, but also dynamic ones such as layer pose and system-wide GPU utilization.

Automatic Layer Filtering

XrCompositionLayerSettingsFlagBitsFB is extended with XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META

To enable automatic selection of layer filtering method, XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META is passed to the runtime in XrCompositionLayerSettingsFB::layerFlags.

A candidate pool of preferred layer filtering methods from XrCompositionLayerSettingsFlagBitsFB

must be passed along with XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META. The runtime **may** apply the appropriate filter when rendering the layer. The runtime **must** return XR_ERROR_VALIDATION_FAILURE from xrEndFrame when an XrCompositionLayerSettingsFB structure is submitted with one or more of the layers if no other flag bits are supplied with XR_COMPOSITION_LAYER_SETTINGS_AUTO_LAYER_FILTER_BIT_META.

12.143.1. Overview

This extension enables applications utilizing XR_FB_body_tracking to override automatic calibration, and to determine the current calibration status for automatic calibration.

Applications **can** call the xrSuggestBodyTrackingCalibrationOverrideMETA function to override calibration on request, for example, when the user indicates it is desired through an in-app UI.

Typical times to calibrate are during app startup (when body tracking is first initialized), on user request, when calibration is detected to be low quality, and on user switch.

Manual calibration is validated, with applications providing accurate values to the runtime.

12.143.2. Inspect system capability

The XrSystemPropertiesBodyTrackingCalibrationMETA structure is defined as:

```
// Provided by XR_META_body_tracking_calibration
typedef struct XrSystemPropertiesBodyTrackingCalibrationMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsHeightOverride;
} XrSystemPropertiesBodyTrackingCalibrationMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- supportsHeightOverride is an XrBool32, indicating if the current system is capable of supporting body tracking calibration height override.

An application **can** inspect whether the system supports body tracking and body calibration by extending the XrSystemProperties with XrSystemPropertiesBodyTrackingCalibrationMETA structure when calling xrGetSystemProperties.

If a runtime returns XR_FALSE for supportsHeightOverride, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrSuggestBodyTrackingCalibrationOverrideMETA and from xrResetBodyTrackingCalibrationMETA.

Valid Usage (Implicit)

- The XR_META_body_tracking_calibration extension **must** be enabled prior to using XrSystemPropertiesBodyTrackingCalibrationMETA
- type **must** be XR_TYPE_SYSTEM_PROPERTIES_BODY_TRACKING_CALIBRATION_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.143.3. Overriding the user height

The xrSuggestBodyTrackingCalibrationOverrideMETA function is defined as:

```
// Provided by XR_META_body_tracking_calibration
XrResult xrSuggestBodyTrackingCalibrationOverrideMETA(
    XrBodyTrackerFB                             bodyTracker,
    const XrBodyTrackingCalibrationInfoMETA*    calibrationInfo);
```

Parameter Descriptions

- bodyTracker is an XrBodyTrackerFB previously created by xrCreateBodyTrackerFB.
- calibrationInfo is an XrBodyTrackingCalibrationInfoMETA specifying the calibration parameters.

Applications **can** choose to call xrSuggestBodyTrackingCalibrationOverrideMETA on app startup, or implement a UI to allow users to specify when it should be called.

Runtimes **must** return XR_ERROR_VALIDATION_FAILURE if the specified height falls outside the range (0.5 meters, 3 meters).

Runtimes **should** use the provided calibration data as an input to calibrate any body tracking algorithms.

Valid Usage (Implicit)

- The XR_META_body_tracking_calibration extension **must** be enabled prior to calling xrSuggestBodyTrackingCalibrationOverrideMETA
- bodyTracker **must** be a valid XrBodyTrackerFB handle
- calibrationInfo **must** be a pointer to a valid XrBodyTrackingCalibrationInfoMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrBodyTrackingCalibrationInfoMETA structure is defined as:

```
// Provided by XR_META_body_tracking_calibration
typedef struct XrBodyTrackingCalibrationInfoMETA {
    XrStructureType    type;
    const void*        next;
    float              bodyHeight;
} XrBodyTrackingCalibrationInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- bodyHeight is a float value specifying the height of the user to use for calibration (in meters).

The XrBodyTrackingCalibrationInfoMETA structure contains the user's height that the runtime **should** use to calibrate body tracking.

Valid Usage (Implicit)

- The `XR_META_body_tracking_calibration` extension **must** be enabled prior to using XrBodyTrackingCalibrationInfoMETA
- `type` **must** be `XR_TYPE_BODY_TRACKING_CALIBRATION_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.143.4. Reset body tracking calibration.

The xrResetBodyTrackingCalibrationMETA function is defined as:

```
// Provided by XR_META_body_tracking_calibration
XrResult xrResetBodyTrackingCalibrationMETA(
    XrBodyTrackerFB                             bodyTracker);
```

Parameter Descriptions

- `bodyTracker` is an XrBodyTrackerFB previously created by xrCreateBodyTrackerFB.

This function removes any height override previously set by xrSuggestBodyTrackingCalibrationOverrideMETA and allows the runtime to return to automatic calibration.

Valid Usage (Implicit)

- The `XR_META_body_tracking_calibration` extension **must** be enabled prior to calling xrResetBodyTrackingCalibrationMETA
- `bodyTracker` **must** be a valid XrBodyTrackerFB handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.143.5. Body Tracking Calibration Status

The XrBodyTrackingCalibrationStateMETA enum describes the current calibration state.

```
// Provided by XR_META_body_tracking_calibration
typedef enum XrBodyTrackingCalibrationStateMETA {
    XR_BODY_TRACKING_CALIBRATION_STATE_VALID_META = 1,
    XR_BODY_TRACKING_CALIBRATION_STATE_CALIBRATING_META = 2,
    XR_BODY_TRACKING_CALIBRATION_STATE_INVALID_META = 3,
    XR_BODY_TRACKING_CALIBRATION_STATE_MAX_ENUM_META = 0x7FFFFFFF
} XrBodyTrackingCalibrationStateMETA;
```

Enum	Description
XR_BODY_TRACKING_CALIBRATION_STATE_VALID_META	Valid calibration, body tracking expected to be stable.
XR_BODY_TRACKING_CALIBRATION_STATE_CALIBRATING_META	Calibration is in progress, body joint poses from XR_FB_body_tracking are valid to read and internally consistent within a single call, but **may** be more variable than normal, shifting dramatically before calibration ends.

Enum	Description
XR_BODY_TRACKING_CALIBRATION_STATE_INVALID_META	Calibration is invalid, accessing the body joint poses from XR_FB_body_tracking is defined behavior but their contents are unspecified. Tracking data **may** be read but **must** not be interpreted as body tracking poses.

The XrBodyTrackingCalibrationStatusMETA structure is defined as:

```
// Provided by XR_META_body_tracking_calibration
typedef struct XrBodyTrackingCalibrationStatusMETA {
    XrStructureType                       type;
    void*                                 next;
    XrBodyTrackingCalibrationStateMETA    status;
} XrBodyTrackingCalibrationStatusMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- status is one of XrBodyTrackingCalibrationStateMETA indicating the current calibration status.

The XrBodyTrackingCalibrationStatusMETA structure contains a XrBodyTrackingCalibrationStateMETA that describes the current calibration status.

The application **can** obtain the calibration status by adding XrBodyTrackingCalibrationStatusMETA to the XrBodyJointLocationsFB::next chain when calling xrLocateBodyJointsFB.

Valid Usage (Implicit)

- The XR_META_body_tracking_calibration extension **must** be enabled prior to using XrBodyTrackingCalibrationStatusMETA
- type **must** be XR_TYPE_BODY_TRACKING_CALIBRATION_STATUS_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.143.6. New Commands

12.144.1. Overview

This extension enables applications to control tradeoffs with body tracking quality and performance.

This extension builds on top of the XR_FB_body_tracking extension which provides the actual body tracking output.

12.144.2. Interaction with other extensions

- XR_META_simultaneous_hands_and_controllers - Both high and low fidelity body tracking is able to work regardless of whether hands or controllers are in use. Body tracking hands **should** reflect the location of the user's hands.
- XR_META_hand_tracking_wide_motion_mode - Wide motion mode for hand tracking **may** use body tracking internally, and **may** force the system to use high fidelity. In this case, the system **may** use high fidelity tracking even when the application requests low fidelity.
- XR_META_detached_controllers - Both high and low fidelity body tracking is able to work regardless of whether hands or controllers are in use. Body tracking **should** not use the location of detached controllers to calculate its output.
- XR_META_body_tracking_full_body - Full body tracking **must** be compatible with both high fidelity and low fidelity body tracking. If a runtime does not support a low fidelity full body tracking system, the runtime **may** report that high fidelity is already in use when full body is in use.
- XR_EXT_hand_tracking_data_source - When the runtime is simulating hands via controllers, body tracking will similarly simulate hands via controllers.

12.144.3. Inspect system capability

The XrSystemPropertiesBodyTrackingFidelityMETA structure is defined as:

```
// Provided by XR_META_body_tracking_fidelity
typedef struct XrSystemPropertiesBodyTrackingFidelityMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsBodyTrackingFidelity;
} XrSystemPropertiesBodyTrackingFidelityMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsBodyTrackingFidelity` is an `XrBool32`, indicating if current system is capable of changing body tracking fidelity.

An application **can** inspect whether the system is capable of controlling body tracking fidelity by extending the XrSystemProperties with XrSystemPropertiesBodyTrackingFidelityMETA structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsBodyTrackingFidelity`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrRequestBodyTrackingFidelityMETA.

Valid Usage (Implicit)

- The `XR_META_body_tracking_fidelity` extension **must** be enabled prior to using XrSystemPropertiesBodyTrackingFidelityMETA
- `type` **must** be `XR_TYPE_SYSTEM_PROPERTIES_BODY_TRACKING_FIDELITY_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.144.4. Setting requested fidelity

The xrRequestBodyTrackingFidelityMETA function is defined as:

```
// Provided by XR_META_body_tracking_fidelity
XrResult xrRequestBodyTrackingFidelityMETA(
    XrBodyTrackerFB                         bodyTracker,
    const XrBodyTrackingFidelityMETA        fidelity);
```

Parameter Descriptions

- `bodyTracker` is an XrBodyTrackerFB used to specify which body tracker we want to configure fidelity.
- `fidelity` is the XrBodyTrackingFidelityMETA enum value specifying the desired fidelity.

An application **can** request a desired fidelity using the xrRequestBodyTrackingFidelityMETA function.

If the system does not support changing body tracking fidelity, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrRequestBodyTrackingFidelityMETA.

The xrRequestBodyTrackingFidelityMETA function allows applications to express a preference for body tracking fidelity, but this is a request that the runtime is allowed to ignore. The runtime **must** return `XR_SUCCESS` if the request is valid, even if the runtime will not honor the requested fidelity level.

The runtime **may** ignore the requested fidelity due to system load, thermal state, or when other active extensions require a higher fidelity level. When the application calls xrLocateBodyJointsFB with XrBodyTrackingFidelityStatusMETA in the next chain, the runtime will report the actual fidelity level in use.

Valid Usage (Implicit)

- The `XR_META_body_tracking_fidelity` extension **must** be enabled prior to calling xrRequestBodyTrackingFidelityMETA
- `bodyTracker` **must** be a valid XrBodyTrackerFB handle
- `fidelity` **must** be a valid XrBodyTrackingFidelityMETA value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_META_body_tracking_fidelity
typedef enum XrBodyTrackingFidelityMETA {
    XR_BODY_TRACKING_FIDELITY_LOW_META = 1,
    XR_BODY_TRACKING_FIDELITY_HIGH_META = 2,
    XR_BODY_TRACKING_FIDELITY_MAX_ENUM_META = 0x7FFFFFFF
} XrBodyTrackingFidelityMETA;
```

Enum	Description
XR_BODY_TRACKING_FIDELITY_LOW_META	This value indicates that the body tracking runtime uses a simpler algorithm or less input to estimate the body pose in a way that trades off pose quality for system performance. For example, low fidelity may not accurately track a user's elbows.
XR_BODY_TRACKING_FIDELITY_HIGH_META	This value indicates that the body tracking runtime uses more advanced algorithms or more inputs to estimate the body pose. For example high fidelity may track a user's elbows.

The runtime **may** support a variety of fidelity options for body tracking expression. The application **can** request a desired fidelity, and the runtime will attempt to use that fidelity to provide body tracking for this application.

The XrBodyTrackingFidelityStatusMETA structure is defined as:

```
// Provided by XR_META_body_tracking_fidelity
typedef struct XrBodyTrackingFidelityStatusMETA {
    XrStructureType               type;
    void*                         next;
    XrBodyTrackingFidelityMETA    fidelity;
} XrBodyTrackingFidelityStatusMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `fidelity` is an XrBodyTrackingFidelityMETA that describes the fidelity in use by the runtime.

The XrBodyTrackingFidelityStatusMETA structure is used to obtain the fidelity of the body tracking system.

An application **can** inspect which fidelity is in use by the runtime by extending the XrBodyJointLocationsFB with XrBodyTrackingFidelityStatusMETA structure when calling xrLocateBodyJointsFB.

Valid Usage (Implicit)

- The `XR_META_body_tracking_fidelity` extension **must** be enabled prior to using XrBodyTrackingFidelityStatusMETA
- `type` **must** be `XR_TYPE_BODY_TRACKING_FIDELITY_STATUS_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.144.5. Example code for setting fidelity

The following example code demonstrates how to set and inspect the body tracking fidelity.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized
XrBodyTrackerFB bodyTracker; // previously initialized
PFN_xrLocateBodyJointsFB pfnLocateBodyJointsFB; // previously initialized
XrSpace stageSpace; // previously initialized

// Confirm body tracking fidelity system support.
XrSystemPropertiesBodyTrackingFidelityMETA bodyTrackingFidelitySystemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES_BODY_TRACKING_FIDELITY_META,
```

```
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &bodyTrackingFidelitySystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!bodyTrackingFidelitySystemProperties.supportsBodyTrackingFidelity) {
    // The system does not support body tracking fidelity.
    return;
}

// Get function pointer for xrRequestBodyTrackingFidelityMETA.
PFN_xrRequestBodyTrackingFidelityMETA pfnRequestBodyTrackingFidelity = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrRequestBodyTrackingFidelityMETA",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnRequestBodyTrackingFidelity)));
CHK_XR(pfnRequestBodyTrackingFidelity(bodyTracker, XR_BODY_TRACKING_FIDELITY_HIGH_META));

while (1) {
    // ...
    // For every frame in the frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    // input
    XrBodyJointsLocateInfoFB locateInfo{
        .type = XR_TYPE_BODY_JOINTS_LOCATE_INFO_FB,
        .next = nullptr,
        .baseSpace = stageSpace,
        .time = time,
    };

    // output
    XrBodyTrackingFidelityStatusMETA bodyFidelityStatus{
        .type = XR_TYPE_BODY_TRACKING_FIDELITY_STATUS_META,
    };
    XrBodyJointLocationFB jointLocations[XR_BODY_JOINT_COUNT_FB];
    XrBodyJointLocationsFB bodyLocations{
        .type = XR_TYPE_BODY_JOINT_LOCATIONS_FB,
        .next = &bodyFidelityStatus,
        .jointCount = XR_BODY_JOINT_COUNT_FB,
        .jointLocations = jointLocations,
    };

    CHK_XR(pfnLocateBodyJointsFB(bodyTracker, &locateInfo, &bodyLocations));
    if (bodyFidelityStatus.fidelity != XR_BODY_TRACKING_FIDELITY_HIGH_META) {

12.145.1. Overview

This extends body tracking to support the full body including the lower body.

This extension builds on top of the XR_FB_body_tracking extension, which only exposed the upper body, torso, and hands.

12.145.2. Inspect system capability

The XrSystemPropertiesBodyTrackingFullBodyMETA structure is defined as:

```
// Provided by XR_META_body_tracking_full_body
typedef struct XrSystemPropertiesBodyTrackingFullBodyMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsFullBodyTracking;
} XrSystemPropertiesBodyTrackingFullBodyMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsFullBodyTracking` is an `XrBool32`, indicating if current system is capable of locating the full body tracking jointset.

An application **can** inspect whether the system is capable of full body tracking by extending the XrSystemProperties with XrSystemPropertiesBodyTrackingFullBodyMETA structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsFullBodyTracking`, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` from xrCreateBodyTrackerFB when trying to create a body tracker for full body tracking using the joint set `XR_BODY_JOINT_SET_FULL_BODY_META`.

Valid Usage (Implicit)

- The `XR_META_body_tracking_full_body` extension **must** be enabled prior to using XrSystemPropertiesBodyTrackingFullBodyMETA
- `type` **must** be `XR_TYPE_SYSTEM_PROPERTIES_BODY_TRACKING_FULL_BODY_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.145.3. Creating body tracker for full body tracking

The XrBodyJointSetFB enum is extended with a new joint set `XR_BODY_JOINT_SET_FULL_BODY_META`, which can be set as the joint set in the XrBodyTrackerCreateInfoFB info parameter to xrCreateBodyTrackerFB.

```
// Provided by XR_META_body_tracking_full_body
typedef enum XrFullBodyJointMETA {
    XR_FULL_BODY_JOINT_ROOT_META = 0,
    XR_FULL_BODY_JOINT_HIPS_META = 1,
    XR_FULL_BODY_JOINT_SPINE_LOWER_META = 2,
    XR_FULL_BODY_JOINT_SPINE_MIDDLE_META = 3,
    XR_FULL_BODY_JOINT_SPINE_UPPER_META = 4,
    XR_FULL_BODY_JOINT_CHEST_META = 5,
    XR_FULL_BODY_JOINT_NECK_META = 6,
    XR_FULL_BODY_JOINT_HEAD_META = 7,
    XR_FULL_BODY_JOINT_LEFT_SHOULDER_META = 8,
```

```
    XR_FULL_BODY_JOINT_LEFT_SCAPULA_META = 9,
    XR_FULL_BODY_JOINT_LEFT_ARM_UPPER_META = 10,
    XR_FULL_BODY_JOINT_LEFT_ARM_LOWER_META = 11,
    XR_FULL_BODY_JOINT_LEFT_HAND_WRIST_TWIST_META = 12,
    XR_FULL_BODY_JOINT_RIGHT_SHOULDER_META = 13,
    XR_FULL_BODY_JOINT_RIGHT_SCAPULA_META = 14,
    XR_FULL_BODY_JOINT_RIGHT_ARM_UPPER_META = 15,
    XR_FULL_BODY_JOINT_RIGHT_ARM_LOWER_META = 16,
    XR_FULL_BODY_JOINT_RIGHT_HAND_WRIST_TWIST_META = 17,
    XR_FULL_BODY_JOINT_LEFT_HAND_PALM_META = 18,
    XR_FULL_BODY_JOINT_LEFT_HAND_WRIST_META = 19,
    XR_FULL_BODY_JOINT_LEFT_HAND_THUMB_METACARPAL_META = 20,
    XR_FULL_BODY_JOINT_LEFT_HAND_THUMB_PROXIMAL_META = 21,
    XR_FULL_BODY_JOINT_LEFT_HAND_THUMB_DISTAL_META = 22,
    XR_FULL_BODY_JOINT_LEFT_HAND_THUMB_TIP_META = 23,
    XR_FULL_BODY_JOINT_LEFT_HAND_INDEX_METACARPAL_META = 24,
    XR_FULL_BODY_JOINT_LEFT_HAND_INDEX_PROXIMAL_META = 25,
    XR_FULL_BODY_JOINT_LEFT_HAND_INDEX_INTERMEDIATE_META = 26,

    XR_FULL_BODY_JOINT_LEFT_HAND_RING_INTERMEDIATE_META = 36,
    XR_FULL_BODY_JOINT_LEFT_HAND_RING_DISTAL_META = 37,
    XR_FULL_BODY_JOINT_LEFT_HAND_RING_TIP_META = 38,
    XR_FULL_BODY_JOINT_LEFT_HAND_LITTLE_METACARPAL_META = 39,
    XR_FULL_BODY_JOINT_LEFT_HAND_LITTLE_PROXIMAL_META = 40,
    XR_FULL_BODY_JOINT_LEFT_HAND_LITTLE_INTERMEDIATE_META = 41,
    XR_FULL_BODY_JOINT_LEFT_HAND_LITTLE_DISTAL_META = 42,
    XR_FULL_BODY_JOINT_LEFT_HAND_LITTLE_TIP_META = 43,
    XR_FULL_BODY_JOINT_RIGHT_HAND_PALM_META = 44,
    XR_FULL_BODY_JOINT_RIGHT_HAND_WRIST_META = 45,
    XR_FULL_BODY_JOINT_RIGHT_HAND_THUMB_METACARPAL_META = 46,
    XR_FULL_BODY_JOINT_RIGHT_HAND_THUMB_PROXIMAL_META = 47,
    XR_FULL_BODY_JOINT_RIGHT_HAND_THUMB_DISTAL_META = 48,
    XR_FULL_BODY_JOINT_RIGHT_HAND_THUMB_TIP_META = 49,
    XR_FULL_BODY_JOINT_RIGHT_HAND_INDEX_METACARPAL_META = 50,
    XR_FULL_BODY_JOINT_RIGHT_HAND_INDEX_PROXIMAL_META = 51,
    XR_FULL_BODY_JOINT_RIGHT_HAND_INDEX_INTERMEDIATE_META = 52,
    XR_FULL_BODY_JOINT_RIGHT_HAND_INDEX_DISTAL_META = 53,
    XR_FULL_BODY_JOINT_RIGHT_HAND_INDEX_TIP_META = 54,
    XR_FULL_BODY_JOINT_RIGHT_HAND_MIDDLE_METACARPAL_META = 55,
    XR_FULL_BODY_JOINT_RIGHT_HAND_MIDDLE_PROXIMAL_META = 56,
```

```
    XR_FULL_BODY_JOINT_RIGHT_HAND_MIDDLE_INTERMEDIATE_META = 57,
    XR_FULL_BODY_JOINT_RIGHT_HAND_MIDDLE_DISTAL_META = 58,
    XR_FULL_BODY_JOINT_RIGHT_HAND_MIDDLE_TIP_META = 59,
    XR_FULL_BODY_JOINT_RIGHT_HAND_RING_METACARPAL_META = 60,
    XR_FULL_BODY_JOINT_RIGHT_HAND_RING_PROXIMAL_META = 61,
    XR_FULL_BODY_JOINT_RIGHT_HAND_RING_INTERMEDIATE_META = 62,
    XR_FULL_BODY_JOINT_RIGHT_HAND_RING_DISTAL_META = 63,
    XR_FULL_BODY_JOINT_RIGHT_HAND_RING_TIP_META = 64,
    XR_FULL_BODY_JOINT_RIGHT_HAND_LITTLE_METACARPAL_META = 65,
    XR_FULL_BODY_JOINT_RIGHT_HAND_LITTLE_PROXIMAL_META = 66,
    XR_FULL_BODY_JOINT_RIGHT_HAND_LITTLE_INTERMEDIATE_META = 67,
    XR_FULL_BODY_JOINT_RIGHT_HAND_LITTLE_DISTAL_META = 68,
    XR_FULL_BODY_JOINT_RIGHT_HAND_LITTLE_TIP_META = 69,
    XR_FULL_BODY_JOINT_LEFT_UPPER_LEG_META = 70,
    XR_FULL_BODY_JOINT_LEFT_LOWER_LEG_META = 71,
    XR_FULL_BODY_JOINT_LEFT_FOOT_ANKLE_TWIST_META = 72,
    XR_FULL_BODY_JOINT_LEFT_FOOT_ANKLE_META = 73,
    XR_FULL_BODY_JOINT_LEFT_FOOT_SUBTALAR_META = 74,
    XR_FULL_BODY_JOINT_LEFT_FOOT_TRANSVERSE_META = 75,
    XR_FULL_BODY_JOINT_LEFT_FOOT_BALL_META = 76,
    XR_FULL_BODY_JOINT_RIGHT_UPPER_LEG_META = 77,
    XR_FULL_BODY_JOINT_RIGHT_LOWER_LEG_META = 78,
    XR_FULL_BODY_JOINT_RIGHT_FOOT_ANKLE_TWIST_META = 79,
    XR_FULL_BODY_JOINT_RIGHT_FOOT_ANKLE_META = 80,
    XR_FULL_BODY_JOINT_RIGHT_FOOT_SUBTALAR_META = 81,
    XR_FULL_BODY_JOINT_RIGHT_FOOT_TRANSVERSE_META = 82,
    XR_FULL_BODY_JOINT_RIGHT_FOOT_BALL_META = 83,
    XR_FULL_BODY_JOINT_COUNT_META = 84,
    XR_FULL_BODY_JOINT_NONE_META = 85,
    XR_FULL_BODY_JOINT_MAX_ENUM_META = 0x7FFFFFFF
} XrFullBodyJointMETA;
```

These joint enumeration values index into the array returned by body tracking when the joint set `XR_BODY_JOINT_SET_FULL_BODY_META` is used. There are a total of `XR_FULL_BODY_JOINT_COUNT_META` joints in this set.

The joint indices shared with XrBodyJointFB have the same semantic meaning. The meaning of joint index 0 through `XR_BODY_JOINT_COUNT_FB` - 1 (69) matches the corresponding index in XrBodyJointFB.

12.145.4. Example code for setting full body tracking

The following example code demonstrates how to create a body tracker with full body joint set.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized
```

```
PFN_xrCreateBodyTrackerFB pfnCreateBodyTrackerFB; // previously initialized
PFN_xrLocateBodyJointsFB pfnLocateBodyJointsFB; // previously initialized
XrSpace stageSpace; // previously initialized

// Confirm full body tracking system support.
XrSystemPropertiesBodyTrackingFullBodyMETA bodyTrackingFullBodySystemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES_BODY_TRACKING_FULL_BODY_META,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &bodyTrackingFullBodySystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!bodyTrackingFullBodySystemProperties.supportsFullBodyTracking) {
  // The system does not support full body tracking.
  return;
}

XrBodyTrackerCreateInfoFB createInfo{
    .type = XR_TYPE_BODY_TRACKER_CREATE_INFO_FB,
    .next =  nullptr,
    .bodyJointSet = XR_BODY_JOINT_SET_FULL_BODY_META,
};
XrBodyTrackerFB bodyTracker{XR_NULL_HANDLE};
CHK_XR(pfnCreateBodyTrackerFB(session, &createInfo, &bodyTracker));

while (1) {
  // ...
  // For every frame in the frame loop
  // ...
  XrFrameState frameState; // previously returned from xrWaitFrame
  const XrTime time = frameState.predictedDisplayTime;

  XrBodyJointLocationFB jointLocations[XR_FULL_BODY_JOINT_COUNT_META];
  XrBodyJointsLocateInfoFB locateInfo{
      .type = XR_TYPE_BODY_JOINTS_LOCATE_INFO_FB,
      .next = nullptr,
      .baseSpace = stageSpace,
      .time = time,
  };
  XrBodyJointLocationsFB bodyLocations{
      .type = XR_TYPE_BODY_JOINT_LOCATIONS_FB,
      .next = nullptr,
      .jointCount = XR_FULL_BODY_JOINT_COUNT_META,
      .jointLocations = jointLocations,
  };
```

```
    CHK_XR(pfnLocateBodyJointsFB(bodyTracker, &locateInfo, &bodyLocations));
}
```

12.146.1. Overview

Some applications include both MR/AR (users see their environment) and VR (users have immersive experiences) portions. In the MR/AR portion, the application might want to suppress the boundary visibility so that the user moves freely if there are no safety concerns. In the VR portion, the application might not want to suppress the boundary visibility so that the user stays safely within the boundary.

This extension enables the application to request the runtime to change the boundary visibility. The runtime **may** accept such a request depending on runtime-specific conditions.

12.146.2. Requesting the runtime to change the boundary visibility

The xrRequestBoundaryVisibilityMETA function is defined as:

```
// Provided by XR_META_boundary_visibility
XrResult xrRequestBoundaryVisibilityMETA(
    XrSession                                   session,
    XrBoundaryVisibilityMETA                    boundaryVisibility);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `boundaryVisibility` is a valid XrBoundaryVisibilityMETA value.

The xrRequestBoundaryVisibilityMETA function is used by the application to request a specific

boundary visibility represented with XrBoundaryVisibilityMETA. The function returns XR_SUCCESS if the runtime accepted the request. The function returns XR_BOUNDARY_VISIBILITY_SUPPRESSION_NOT_ALLOWED_META if the runtime did not accept the request to suppress the boundary visibility depending on runtime-specific conditions. An example of the runtime-specific conditions preventing the boundary visibility from changing **may** be the application fully obscuring the real world environment. The application **can** request suppressing the boundary visibility later again, and the runtime **may** accept the new request when the conditions are met.

Valid Usage (Implicit)

- The XR_META_boundary_visibility extension **must** be enabled prior to calling xrRequestBoundaryVisibilityMETA
- session **must** be a valid XrSession handle
- boundaryVisibility **must** be a valid XrBoundaryVisibilityMETA value

Return Codes

Success

- XR_SUCCESS
- XR_BOUNDARY_VISIBILITY_SUPPRESSION_NOT_ALLOWED_META
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrBoundaryVisibilityMETA enum is defined as:

```
// Provided by XR_META_boundary_visibility
typedef enum XrBoundaryVisibilityMETA {
    XR_BOUNDARY_VISIBILITY_NOT_SUPPRESSED_META = 1,
    XR_BOUNDARY_VISIBILITY_SUPPRESSED_META = 2,
    XR_BOUNDARY_VISIBILITY_MAX_ENUM_META = 0x7FFFFFFF
} XrBoundaryVisibilityMETA;
```

Enumerant Descriptions

- XR_BOUNDARY_VISIBILITY_NOT_SUPPRESSED_META — Boundary visibility is not suppressed.
- XR_BOUNDARY_VISIBILITY_SUPPRESSED_META — Boundary visibility is suppressed.

12.146.3. Event indicating that the boundary visibility has changed in the runtime

The XrEventDataBoundaryVisibilityChangedMETA structure is defined as:

```
// Provided by XR_META_boundary_visibility
typedef struct XrEventDataBoundaryVisibilityChangedMETA {
    XrStructureType             type;
    const void*                 next;
    XrBoundaryVisibilityMETA    boundaryVisibility;
} XrEventDataBoundaryVisibilityChangedMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- boundaryVisibility is an XrBoundaryVisibilityMETA value to represent the boundary visibility changed in the runtime.

The XrEventDataBoundaryVisibilityChangedMETA structure represents an event indicating that the boundary visibility has changed in the runtime. This event **may** be a result of the xrRequestBoundaryVisibilityMETA function called from this application or some other application. This event **may** also be a result of runtime-specific conditions that changed the boundary visibility. An example of the runtime-specific conditions **may** be the application fully obscuring the real world environment, in which case the runtime **may** change the boundary visibility to XR_BOUNDARY_VISIBILITY_NOT_SUPPRESSED_META.

The runtime **must** queue this event upon a successful call to the xrBeginSession function, regardless of the value of `boundaryVisibility`, so that the application is in sync on the value of the boundary visibility when a session begins running.

The runtime **must** return a valid XrSession handle for a running session.

After the application calls xrEndSession, a running session is ended and the runtime **must** not enqueue this event anymore. Therefore, the application will no longer observe any changes of the `boundaryVisibility` until another running session.

Valid Usage (Implicit)

- The `XR_META_boundary_visibility` extension **must** be enabled prior to using XrEventDataBoundaryVisibilityChangedMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_BOUNDARY_VISIBILITY_CHANGED_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.146.4. System properties

The XrSystemBoundaryVisibilityPropertiesMETA structure is defined as:

```
// Provided by XR_META_boundary_visibility
typedef struct XrSystemBoundaryVisibilityPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsBoundaryVisibility;
} XrSystemBoundaryVisibilityPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsBoundaryVisibility` is a boolean value that determines if this capability is supported by the runtime.

The application **can** inspect whether the runtime supports this capability by extending the XrSystemProperties with XrSystemBoundaryVisibilityPropertiesMETA structure when calling xrGetSystemProperties.

If the runtime returns `XR_FALSE` for `supportsBoundaryVisibility`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrRequestBoundaryVisibilityMETA.

Valid Usage (Implicit)

- The XR_META_boundary_visibility extension **must** be enabled prior to using XrSystemBoundaryVisibilityPropertiesMETA
- type **must** be XR_TYPE_SYSTEM_BOUNDARY_VISIBILITY_PROPERTIES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.147.1. Overview

Colocation discovery is a capability available through the `XR_META_colocation_discovery` extension that allows apps to discover physically colocated devices running the same app.

In the context of this extension, "the same application" means "bytewise identical Android package name" when running on an Android-based platform.

12.147.2. Check compatibility

The XrSystemColocationDiscoveryPropertiesMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrSystemColocationDiscoveryPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsColocationDiscovery;
} XrSystemColocationDiscoveryPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsColocationDiscovery` is an `XrBool32` specifying if colocation discovery (and relatedly, colocation advertisement) is supported.

An application **can** inspect whether the system is capable of colocation advertisement and discovery by extending the XrSystemProperties with XrSystemColocationDiscoveryPropertiesMETA structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsColocationDiscovery`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` for all functions in the `XR_META_colocation_discovery` extension.

Colocation advertisement controls whether a device is discoverable using colocation discovery, so the term "colocation discovery" on its own is used here to refer to the combined capability of colocation advertisement and colocation discovery.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrSystemColocationDiscoveryPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_COLOCATION_DISCOVERY_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.147.3. Controlling Colocation Advertisement

The ability for other physically colocated devices running the same application to discover the current device is known as "colocation advertisement". The xrStartColocationAdvertisementMETA function requests starting colocation advertisement, while the xrStopColocationAdvertisementMETA requests that colocation advertisement stop. Both of these functions initiate an asynchronous operation similar to that found in extensions built on `XR_FB_spatial_entity`, with their asynchronous completion results returned in an event structure (XrEventDataStartColocationAdvertisementCompleteMETA and XrEventDataStopColocationAdvertisementCompleteMETA, respectively).

Colocation advertisement **may** stop without being explicitly requested for a variety of reasons. If it stops, whether subsequent to an xrStopColocationAdvertisementMETA call or not, an XrEventDataColocationAdvertisementCompleteMETA event is queued.

The following figures show examples of the advertisement process in two general circumstances: normal use and the case where the runtime stops advertisement before the application requests it.

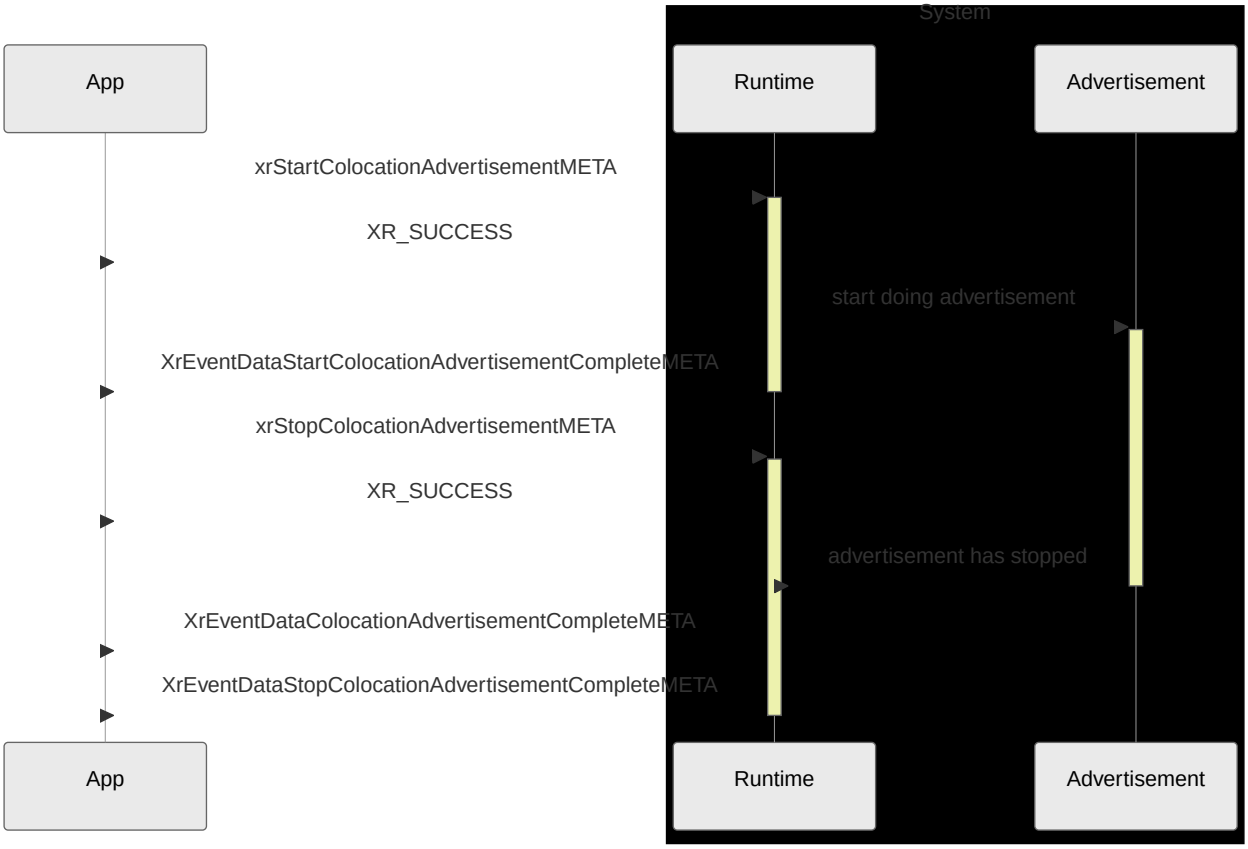

Figure 31. XR_META_colocation_discovery Advertisement Process - Normal

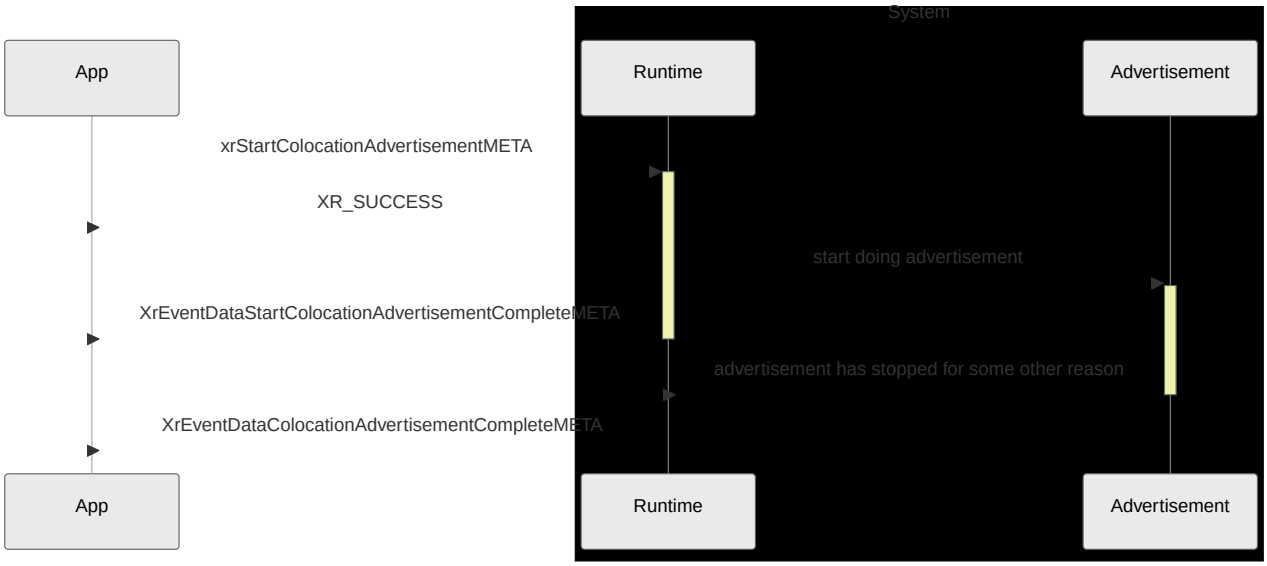

Figure 32. XR_META_colocation_discovery Advertisement Process - runtime needs to stop advertisement

The xrStartColocationAdvertisementMETA function is defined as:

```
// Provided by XR_META_colocation_discovery
XrResult xrStartColocationAdvertisementMETA(
    XrSession                                       session,
    const XrColocationAdvertisementStartInfoMETA* info,
    XrAsyncRequestIdFB*                             advertisementRequestId);
```

Parameter Descriptions

- session is an XrSession in which the colocation discovery will be active.
- info is a pointer to XrColocationAdvertisementStartInfoMETA structure to specify the visibility configuration.
- advertisementRequestId is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request. Note that this ID is used for associating additional events with this original call, in addition to the typical completion event.

The xrStartColocationAdvertisementMETA function requests that the current device become discoverable by other physically colocated devices running the same application.

If the system does not support colocation advertisement and discovery, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrStartColocationAdvertisementMETA. In this case, the runtime **must** return XR_FALSE for XrSystemColocationDiscoveryPropertiesMETA::supportsColocationDiscovery when the function xrGetSystemProperties is called, so that the application knows to not use this functionality.

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataStartColocationAdvertisementCompleteMETA.

If the asynchronous operation is scheduled successfully, the runtime **must** return XR_SUCCESS.

If and only if the runtime returns XR_SUCCESS, the runtime **must** queue a single XrEventDataStartColocationAdvertisementCompleteMETA event identified with a advertisementRequestId matching the advertisementRequestId value output by this function, referred to as the "corresponding completion event."

(This implies that if the runtime returns anything other than XR_SUCCESS, the runtime **must** not queue any XrEventDataStartColocationAdvertisementCompleteMETA events with advertisementRequestId field matching the advertisementRequestId populated by this function.)

If the asynchronous operation is successful, in the corresponding completion event, the runtime **must** set the XrEventDataStartColocationAdvertisementCompleteMETA::result field to XR_SUCCESS.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event,

the runtime **must** set the XrEventDataStartColocationAdvertisementCompleteMETA::`result` field to an appropriate error code instead of `XR_SUCCESS`.

See Figure 31 and Figure 32 for sample flows incorporating use of xrStartColocationAdvertisementMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to calling xrStartColocationAdvertisementMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrColocationAdvertisementStartInfoMETA structure
- `advertisementRequestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_EXTENSION_NOT_PRESENT`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_RUNTIME_UNAVAILABLE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrColocationAdvertisementStartInfoMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrColocationAdvertisementStartInfoMETA {
    XrStructureType    type;
    const void*        next;
    uint32_t           bufferSize;
    uint8_t*           buffer;
} XrColocationAdvertisementStartInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `bufferSize` is the count of bytes used in the `buffer` array. If `bufferSize` is greater than `XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META`, then the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`. The maximum supported count is `XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META`.
- `buffer` is a byte array which allows the application to define app buffer. It is the advertisement payload.

XrColocationAdvertisementStartInfoMETA is the input data for xrStartColocationAdvertisementMETA. Implicitly, while the application has an active advertisement, the runtime will retain a copy of the XrColocationAdvertisementStartInfoMETA submitted with xrStartColocationAdvertisementMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrColocationAdvertisementStartInfoMETA
- `type` **must** be `XR_TYPE_COLOCATION_ADVERTISEMENT_START_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `buffer` **must** be a pointer to an array of `bufferSize` `uint8_t` values
- The `bufferSize` parameter **must** be greater than `0`

```
#define XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META 1024
```

`XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META` is the maximum size of data supported in a colocation advertisement.

The XrEventDataStartColocationAdvertisementCompleteMETA event structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataStartColocationAdvertisementCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    advertisementRequestId;
    XrResult              result;
    XrUuid                advertisementUuid;
} XrEventDataStartColocationAdvertisementCompleteMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `advertisementRequestId` is an `XrAsyncRequestIdFB` that identifies which request this event is in response to. The runtime **must** ensure this value matches a `advertisementRequestId` returned during an xrStartColocationAdvertisementMETA call.
- `result` is an XrResult that specifies the request result. The valid `result` values are: `XR_SUCCESS`, `XR_ERROR_RUNTIME_FAILURE`, `XR_COLOCATION_DISCOVERY_ALREADY_ADVERTISING_META`, `XR_ERROR_COLOCATION_DISCOVERY_NO_DISCOVERY_METHOD_META`, and `XR_ERROR_COLOCATION_DISCOVERY_NETWORK_FAILED_META`. If the application already has an active colocation advertisement, the runtime **must** return `XR_COLOCATION_DISCOVERY_ALREADY_ADVERTISING_META` in this field.
- `advertisementUuid` is an XrUuid which is discoverable by other physically colocated devices running the same application. The runtime **must** return a unique XrUuid which has not been returned in a previous XrEventDataStartColocationAdvertisementCompleteMETA event, if `result` is `XR_SUCCESS`.

This event conveys the results of the asynchronous operation started by xrStopColocationAdvertisementMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrEventDataStartColocationAdvertisementCompleteMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_START_COLOCATION_ADVERTISEMENT_COMPLETE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataColocationAdvertisementCompleteMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataColocationAdvertisementCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    advertisementRequestId;
    XrResult              result;
} XrEventDataColocationAdvertisementCompleteMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `advertisementRequestId` is an `XrAsyncRequestIdFB` specifying the original start advertisement async request id. The runtime **must** return a value which matches a previously returned `advertisementRequestId` value from an xrStartColocationAdvertisementMETA request.
- `result` is an XrResult representing the advertisement process result. The valid `result` values are: `XR_SUCCESS`, `XR_ERROR_RUNTIME_FAILURE`, and `XR_ERROR_COLOCATION_DISCOVERY_NO_DISCOVERY_METHOD_META`.

The runtime **must** queue exactly one XrEventDataColocationAdvertisementCompleteMETA event whenever an active colocation advertisement is stopped. This includes if the colocation advertisement is stopped due to an application calling xrStopColocationAdvertisementMETA, or the runtime needs to stop the colocation advertisement for any reason. If the colocation advertisement is stopped due to an application calling xrStopColocationAdvertisementMETA, the runtime **must** queue the XrEventDataColocationAdvertisementCompleteMETA event before queuing the corresponding XrEventDataStopColocationAdvertisementCompleteMETA event. When the XrSession is destroyed, the runtime **must** stop all active advertisements started from the same XrSession.

See Figure 31 and Figure 32 for sample flows that show how XrEventDataColocationAdvertisementCompleteMETA is used.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrEventDataColocationAdvertisementCompleteMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_COLOCATION_ADVERTISEMENT_COMPLETE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrStopColocationAdvertisementMETA function is defined as:

```
// Provided by XR_META_colocation_discovery
XrResult xrStopColocationAdvertisementMETA(
    XrSession                                       session,
    const XrColocationAdvertisementStopInfoMETA* info,
    XrAsyncRequestIdFB*                             requestId);
```

Parameter Descriptions

- session is an XrSession in which the colocation discovery will be active.
- info is a pointer to XrColocationAdvertisementStopInfoMETA structure to specify the advertisement configuration.
- requestId is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The application **can** use the xrStopColocationAdvertisementMETA function to disable the ability for other physically colocated devices running the same application to discover the current device.

If the system does not support colocation advertisement and discovery, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrStopColocationAdvertisementMETA. In this case, the runtime **must** return XR_FALSE for XrSystemColocationDiscoveryPropertiesMETA::supportsColocationDiscovery when the function xrGetSystemProperties is called, so that the application knows to not use this functionality.

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataStopColocationAdvertisementCompleteMETA.

If the asynchronous operation is scheduled successfully, the runtime **must** return XR_SUCCESS.

If and only if the runtime returns XR_SUCCESS, the runtime **must** queue a single XrEventDataStopColocationAdvertisementCompleteMETA event identified with a requestId matching the requestId value output by this function, referred to as the "corresponding completion event."

(This implies that if the runtime returns anything other than XR_SUCCESS, the runtime **must** not queue any XrEventDataStopColocationAdvertisementCompleteMETA events with requestId field matching the requestId populated by this function.)

If the asynchronous operation is successful, in the corresponding completion event, the runtime **must** set the XrEventDataStopColocationAdvertisementCompleteMETA::result field to XR_SUCCESS.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event, the runtime **must** set the XrEventDataStopColocationAdvertisementCompleteMETA::result field to an appropriate error code instead of XR_SUCCESS.

See Figure 31 for a sample flow incorporating use of xrStopColocationAdvertisementMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to calling xrStopColocationAdvertisementMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrColocationAdvertisementStopInfoMETA structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_EXTENSION_NOT_PRESENT`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_RUNTIME_UNAVAILABLE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrColocationAdvertisementStopInfoMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrColocationAdvertisementStopInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrColocationAdvertisementStopInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrColocationAdvertisementStopInfoMETA
- `type` **must** be `XR_TYPE_COLOCATION_ADVERTISEMENT_STOP_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataStopColocationAdvertisementCompleteMETA event structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataStopColocationAdvertisementCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataStopColocationAdvertisementCompleteMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `requestId` is an `XrAsyncRequestIdFB` that identifies which request this event is in response to. The runtime **must** ensure this value matches a `requestId` returned during an xrStopColocationAdvertisementMETA call.
- `result` is an XrResult that specifies the request result. The valid `result` values are: `XR_SUCCESS`, `XR_ERROR_RUNTIME_FAILURE`, and `XR_ERROR_COLOCATION_DISCOVERY_NETWORK_FAILED_META`. If the application does not already have an active colocation advertisement, the runtime **must** return `XR_SUCCESS`.

This event conveys the results of the asynchronous operation started by xrStopColocationAdvertisementMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrEventDataStopColocationAdvertisementCompleteMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_STOP_COLOCATION_ADVERTISEMENT_COMPLETE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.147.4. Colocation Discovery

Discovering other physically colocated devices, running the same application and currently advertising, is known as "colocation discovery". It is a background process that is controlled by xrStartColocationDiscoveryMETA and xrStopColocationDiscoveryMETA. Both of these functions initiate an asynchronous operation similar to that found in extensions built on `XR_FB_spatial_entity`, with their asynchronous completion results returned in an event structure (XrEventDataStartColocationDiscoveryCompleteMETA and XrEventDataStopColocationAdvertisementCompleteMETA, respectively).

Results from colocation discovery, if it is successfully started, are returned through a sequence of XrEventDataColocationDiscoveryResultMETA events. When colocation discovery stops for any reason (application request or otherwise), an XrEventDataColocationDiscoveryCompleteMETA event is enqueued.

The following figures show examples of the discovery process in two general circumstances: normal use and the case where the runtime stops discovery before the application requests it.

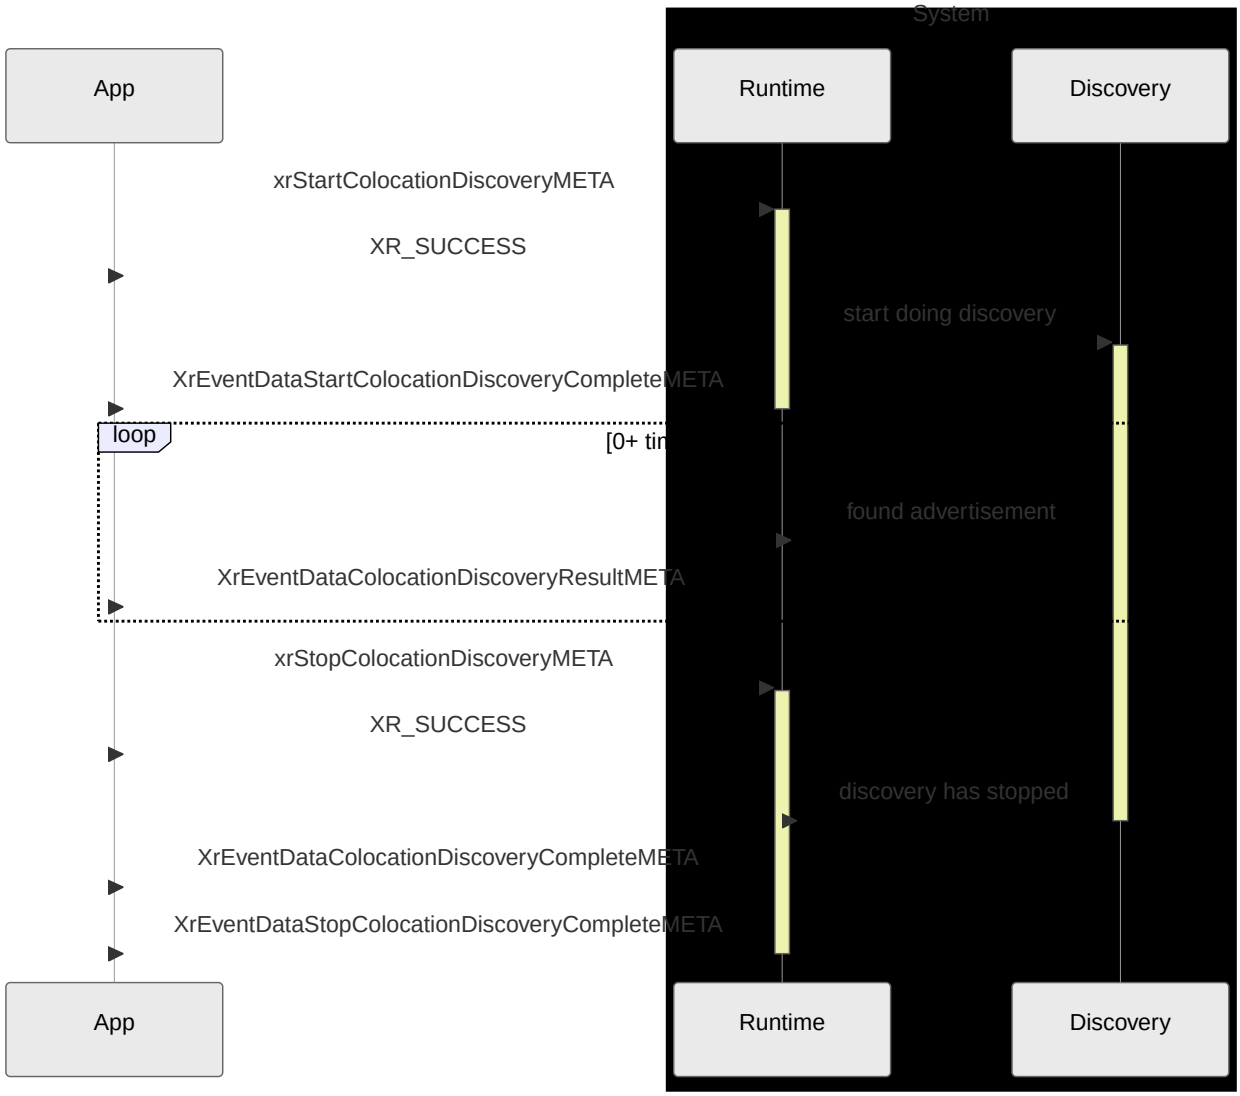

Figure 33. XR_META_colocation_discovery Discovery Process - Normal

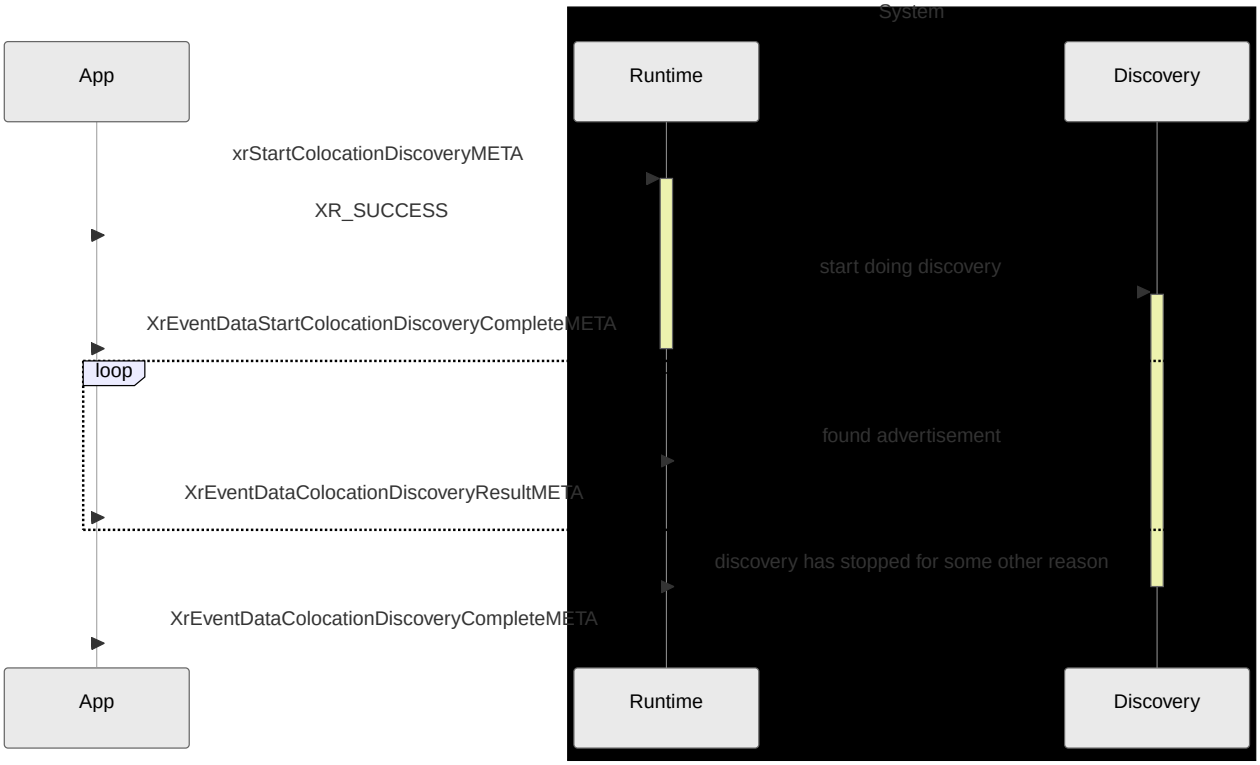

Figure 34. XR_META_colocation_discovery Discovery Process - runtime needs to stop discovery

The xrStartColocationDiscoveryMETA function is defined as:

```
// Provided by XR_META_colocation_discovery
XrResult xrStartColocationDiscoveryMETA(
    XrSession                                   session,
    const XrColocationDiscoveryStartInfoMETA*   info,
    XrAsyncRequestIdFB*                         discoveryRequestId);
```

Parameter Descriptions

- `session` is an XrSession in which the colocation discovery will be active.
- `info` is a pointer to XrColocationDiscoveryStartInfoMETA structure to specify the discovery request information.
- `discoveryRequestId` is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request. Note that this ID is used for associating additional events with this original call, in addition to the typical completion event.

The application **can** call xrStartColocationDiscoveryMETA to start discovering physically colocated devices.

If the system does not support colocation advertisement and discovery, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrStartColocationDiscoveryMETA. In this case, the runtime **must** return `XR_FALSE` for XrSystemColocationDiscoveryPropertiesMETA::`supportsColocationDiscovery` when the function xrGetSystemProperties is called, so that the application knows to not use this functionality.

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataStartColocationDiscoveryCompleteMETA.

If the asynchronous operation is scheduled successfully, the runtime **must** return `XR_SUCCESS`.

If and only if the runtime returns `XR_SUCCESS`, the runtime **must** queue a single XrEventDataStartColocationDiscoveryCompleteMETA event identified with a `discoveryRequestId` matching the `discoveryRequestId` value output by this function, referred to as the "corresponding completion event."

(This implies that if the runtime returns anything other than `XR_SUCCESS`, the runtime **must** not queue any XrEventDataStartColocationDiscoveryCompleteMETA events with `discoveryRequestId` field matching the `discoveryRequestId` populated by this function.)

If the asynchronous operation is successful, in the corresponding completion event, the runtime **must** set the XrEventDataStartColocationDiscoveryCompleteMETA::`result` field to `XR_SUCCESS`. The runtime **may** subsequently queue zero or more XrEventDataColocationDiscoveryResultMETA events asynchronously as the runtime discovers nearby advertisements. Once the application or runtime

stops the colocation discovery, the runtime **must** queue a single XrEventDataColocationDiscoveryCompleteMETA event. All XrEventDataColocationDiscoveryResultMETA and XrEventDataColocationDiscoveryCompleteMETA events will identified with `discoveryRequestId` matching the value populated in `discoveryRequestId` by xrStartColocationDiscoveryMETA.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event, the runtime **must** set the XrEventDataStartColocationDiscoveryCompleteMETA::`result` field to an appropriate error code instead of `XR_SUCCESS`.

If the application already has an active colocation discovery, in the corresponding completion event, the runtime **must** set the XrEventDataStartColocationDiscoveryCompleteMETA::`result` field to `XR_COLOCATION_DISCOVERY_ALREADY_DISCOVERING_META`.

See Figure 33 and Figure 34 for sample flows incorporating use of xrStartColocationDiscoveryMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to calling xrStartColocationDiscoveryMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrColocationDiscoveryStartInfoMETA structure
- `discoveryRequestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_EXTENSION_NOT_PRESENT
- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_RUNTIME_UNAVAILABLE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrColocationDiscoveryStartInfoMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrColocationDiscoveryStartInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrColocationDiscoveryStartInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.

Valid Usage (Implicit)

- The XR_META_colocation_discovery extension **must** be enabled prior to using XrColocationDiscoveryStartInfoMETA
- type **must** be XR_TYPE_COLOCATION_DISCOVERY_START_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataStartColocationDiscoveryCompleteMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataStartColocationDiscoveryCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    discoveryRequestId;
    XrResult              result;
} XrEventDataStartColocationDiscoveryCompleteMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- discoveryRequestId is an XrAsyncRequestIdFB specifying the original start discovery async request id. The runtime **must** return a value which matches a previously returned discoveryRequestId value from an xrStartColocationDiscoveryMETA request.
- result is an XrResult representing the discovery process result. The valid result values are: XR_SUCCESS, XR_ERROR_RUNTIME_FAILURE, XR_ERROR_COLOCATION_DISCOVERY_NETWORK_FAILED_META, XR_ERROR_COLOCATION_DISCOVERY_NO_DISCOVERY_METHOD_META, and XR_COLOCATION_DISCOVERY_ALREADY_DISCOVERING_META. If the application already has an active colocation discovery, the runtime **must** return XR_COLOCATION_DISCOVERY_ALREADY_DISCOVERING_META in XrEventDataStartColocationDiscoveryCompleteMETA::result.

This event conveys the results of the asynchronous operation started by xrStartColocationDiscoveryMETA.

Valid Usage (Implicit)

- The XR_META_colocation_discovery extension **must** be enabled prior to using XrEventDataStartColocationDiscoveryCompleteMETA
- type **must** be XR_TYPE_EVENT_DATA_START_COLOCATION_DISCOVERY_COMPLETE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataColocationDiscoveryResultMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataColocationDiscoveryResultMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    discoveryRequestId;
    XrUuid                advertisementUuid;
    uint32_t              bufferSize;
    uint8_t               buffer[XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META];
} XrEventDataColocationDiscoveryResultMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- discoveryRequestId is an XrAsyncRequestIdFB specifying the original start discovery async request id. The runtime **must** return a value which matches a previously returned discoveryRequestId value from an xrStartColocationDiscoveryMETA request.
- advertisementUuid is an XrUuid of the discovered colocated application.
- bufferSize is the count of bytes used in the buffer array.
- buffer is a byte array which is the application **may** set when the application starts the advertisement.

advertisementUuid and buffer are both considered the payload of colocated advertisements. The value of advertisementUuid matches the value returned in XrEventDataStartColocationAdvertisementCompleteMETA::advertisementUuid on the advertising device.

See Figure 33 and Figure 34 for sample flows that show how XrEventDataColocationDiscoveryResultMETA is used.

Valid Usage (Implicit)

- The XR_META_colocation_discovery extension **must** be enabled prior to using XrEventDataColocationDiscoveryResultMETA
- type **must** be XR_TYPE_EVENT_DATA_COLOCATION_DISCOVERY_RESULT_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataColocationDiscoveryCompleteMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataColocationDiscoveryCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    discoveryRequestId;
    XrResult              result;
} XrEventDataColocationDiscoveryCompleteMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- discoveryRequestId is an XrAsyncRequestIdFB specifying the original start discovery async request id. The runtime **must** return a value which matches a previously returned discoveryRequestId value from an xrStartColocationDiscoveryMETA request.
- result is an XrResult representing the discovery process result. The valid result values are: XR_SUCCESS, XR_ERROR_RUNTIME_FAILURE, and XR_ERROR_COLOCATION_DISCOVERY_NO_DISCOVERY_METHOD_META.

The runtime **must** queue exactly one XrEventDataColocationDiscoveryCompleteMETA event whenever an active colocation discovery is stopped. This includes if the colocation discovery is stopped due to an application calling xrStopColocationDiscoveryMETA, or the runtime needs to stop the colocation discovery for any reason. When the XrSession is destroyed, the runtime **must** stop all active advertisements started from the same XrSession.

See Figure 33 and Figure 34 for sample flows that show how XrEventDataColocationDiscoveryCompleteMETA is used.

Valid Usage (Implicit)

- The XR_META_colocation_discovery extension **must** be enabled prior to using XrEventDataColocationDiscoveryCompleteMETA
- type **must** be XR_TYPE_EVENT_DATA_COLOCATION_DISCOVERY_COMPLETE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrStopColocationDiscoveryMETA function is defined as:

```
// Provided by XR_META_colocation_discovery
XrResult xrStopColocationDiscoveryMETA(
    XrSession                                   session,
    const XrColocationDiscoveryStopInfoMETA*    info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- session is an XrSession in which the colocation discovery will be active.
- info is a pointer to XrColocationDiscoveryStopInfoMETA structure to specify the stop discovery request information.
- requestId is an output parameter, and the variable it points to will be populated with the ID of this asynchronous request.

The application **can** call xrStopColocationDiscoveryMETA to stop an ongoing discovery process that was started by xrStartColocationDiscoveryMETA.

If the system does not support colocation advertisement and discovery, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrStopColocationDiscoveryMETA. In this case, the runtime **must** return XR_FALSE for XrSystemColocationDiscoveryPropertiesMETA::supportsColocationDiscovery when the function xrGetSystemProperties is called, so that the application knows to not use this functionality.

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataStopColocationDiscoveryCompleteMETA.

If the asynchronous operation is scheduled successfully, the runtime **must** return XR_SUCCESS.

If and only if the runtime returns XR_SUCCESS, the runtime **must** queue a single XrEventDataStopColocationDiscoveryCompleteMETA event identified with a requestId matching the requestId value output by this function, referred to as the "corresponding completion event."

(This implies that if the runtime returns anything other than XR_SUCCESS, the runtime **must** not queue

any XrEventDataStopColocationDiscoveryCompleteMETA events with `requestId` field matching the `requestId` populated by this function.)

If the asynchronous operation is successful, in the corresponding completion event, the runtime **must** set the XrEventDataStopColocationDiscoveryCompleteMETA::`result` field to `XR_SUCCESS`.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event, the runtime **must** set the XrEventDataStopColocationDiscoveryCompleteMETA::`result` field to an appropriate error code instead of `XR_SUCCESS`.

See Figure 33 for a sample flow incorporating use of xrStopColocationDiscoveryMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to calling xrStopColocationDiscoveryMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrColocationDiscoveryStopInfoMETA structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_EXTENSION_NOT_PRESENT`
- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_RUNTIME_UNAVAILABLE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrColocationDiscoveryStopInfoMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrColocationDiscoveryStopInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrColocationDiscoveryStopInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrColocationDiscoveryStopInfoMETA
- `type` **must** be `XR_TYPE_COLOCATION_DISCOVERY_STOP_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataStopColocationDiscoveryCompleteMETA structure is defined as:

```
// Provided by XR_META_colocation_discovery
typedef struct XrEventDataStopColocationDiscoveryCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataStopColocationDiscoveryCompleteMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `requestId` is an `XrAsyncRequestIdFB` that identifies which request this event is in response to. The runtime **must** ensure this value matches a `requestId` returned during an xrStopColocationDiscoveryMETA call.
- `result` is an XrResult representing the discovery process result. The valid `result` values are: `XR_SUCCESS` and `XR_ERROR_RUNTIME_FAILURE`. If the application does not already have an active colocation discovery, the runtime **must** return `XR_SUCCESS`.

This event conveys the results of the asynchronous operation started by xrStopColocationDiscoveryMETA.

Valid Usage (Implicit)

- The `XR_META_colocation_discovery` extension **must** be enabled prior to using XrEventDataStopColocationDiscoveryCompleteMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_STOP_COLOCATION_DISCOVERY_COMPLETE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.147.5. New Commands

- xrStartColocationAdvertisementMETA
- xrStartColocationDiscoveryMETA
- xrStopColocationAdvertisementMETA
- xrStopColocationDiscoveryMETA

12.147.6. New Structures

- XrColocationAdvertisementStartInfoMETA
- XrColocationAdvertisementStopInfoMETA
- XrColocationDiscoveryStartInfoMETA
- XrColocationDiscoveryStopInfoMETA
- XrEventDataColocationAdvertisementCompleteMETA
- XrEventDataColocationDiscoveryCompleteMETA

- XrEventDataColocationDiscoveryResultMETA
- XrEventDataStartColocationAdvertisementCompleteMETA
- XrEventDataStartColocationDiscoveryCompleteMETA
- XrEventDataStopColocationAdvertisementCompleteMETA
- XrEventDataStopColocationDiscoveryCompleteMETA
- Extending XrSystemProperties:
  - XrSystemColocationDiscoveryPropertiesMETA

12.147.7. New Enum Constants

- XR_MAX_COLOCATION_DISCOVERY_BUFFER_SIZE_META
- XR_META_COLOCATION_DISCOVERY_EXTENSION_NAME
- XR_META_colocation_discovery_SPEC_VERSION
- Extending XrResult:
  - XR_COLOCATION_DISCOVERY_ALREADY_ADVERTISING_META
  - XR_COLOCATION_DISCOVERY_ALREADY_DISCOVERING_META
  - XR_ERROR_COLOCATION_DISCOVERY_NETWORK_FAILED_META
  - XR_ERROR_COLOCATION_DISCOVERY_NO_DISCOVERY_METHOD_META
- Extending XrStructureType:
  - XR_TYPE_COLOCATION_ADVERTISEMENT_START_INFO_META
  - XR_TYPE_COLOCATION_ADVERTISEMENT_STOP_INFO_META
  - XR_TYPE_COLOCATION_DISCOVERY_START_INFO_META
  - XR_TYPE_COLOCATION_DISCOVERY_STOP_INFO_META
  - XR_TYPE_EVENT_DATA_COLOCATION_ADVERTISEMENT_COMPLETE_META
  - XR_TYPE_EVENT_DATA_COLOCATION_DISCOVERY_COMPLETE_META
  - XR_TYPE_EVENT_DATA_COLOCATION_DISCOVERY_RESULT_META
  - XR_TYPE_EVENT_DATA_START_COLOCATION_ADVERTISEMENT_COMPLETE_META
  - XR_TYPE_EVENT_DATA_START_COLOCATION_DISCOVERY_COMPLETE_META
  - XR_TYPE_EVENT_DATA_STOP_COLOCATION_ADVERTISEMENT_COMPLETE_META
  - XR_TYPE_EVENT_DATA_STOP_COLOCATION_DISCOVERY_COMPLETE_META
  - XR_TYPE_SYSTEM_COLOCATION_DISCOVERY_PROPERTIES_META

12.148.1. Overview

On platforms which support both hand tracking and controller input concurrently, application developers have various use cases that require the ability to track controllers when they are not being held.

- Controllers that are "not held" can have some meaning in-application, for example the ability to act as some sort of marker or anchor.
- In cases when neither controller is currently held, access to pose data for the not-held controllers allows the application to render them for the user to locate, without removing the headset or remembering their physical location in the real world.
- Asymmetric multi-user applications could be created where the user with the immersive display is not holding the controller, but a second person manipulates it.
- In applications that support a tracked hand in combination with a single held controller, a not-held controller might remain relevant to interaction for the application.

A runtime **may** require the app to enable `XR_META_simultaneous_hands_and_controllers` in order to fully

enable the functionality exposed by this extension. If that extension is not enabled, the runtime **must** still accept the bindings, but **may** choose to not report any current interaction profile for */user/detached_controller_meta* paths and not provide action data accordingly.

12.148.2. New Paths

This extension defines two new top level */user* paths:

- */user/detached_controller_meta/left*
- */user/detached_controller_meta/right*

Interaction profiles are extended as follows:

- For any interaction profile valid for */user/hand/left* for which *.../input/grip/pose* is a valid binding sub-path, the runtime **must** accept the same input/output source subpaths on */user/detached_controller_meta/left* in suggested bindings.
- For any interaction profile valid for */user/hand/right* for which *.../input/grip/pose* is a valid binding sub-path, the runtime **must** accept the same input/output source subpaths on */user/detached_controller_meta/right* in suggested bindings.

12.148.3. Beginning Detached Controller Interaction

In-hand detection is left to the implementing runtime. The runtime **may** use proximity data, orientation data, or any other data for both hands and both controllers for in-hand detection. Controllers with handedness **should** be considered "in hand" **only** when held by their corresponding hand (a left controller held in the right hand **should** be considered detached, as should a right controller held in the left hand).

The same interaction profile **may** be used to suggest bindings for top level */user* paths beginning with both */user/hand* and */user/detached_controller_meta* paths, but the runtime **must** only report any given interaction profile as current for **at most one** of these paired top level */user* paths at any given time. That is, if a given interaction profile is reported as current for */user/detached_controller_meta/left*, that same profile **must** not be current for */user/hand/left* (and vice versa), and similarly for */user/detached_controller_meta/right* and */user/hand/right*.

This is done individually such that any combination of held or not-held controllers is representable (both or neither controller held, or one controller held in one hand for left or right controllers).

12.148.4. Ending Detached Controller Interaction

If an interaction profile previously current on a detached path becomes current on the corresponding hand, the current interaction profile of the detached path **must** become XR_NULL_PATH.

However, if a (controller) interaction profile becomes current on a "detached" top level */user* path, a hand-related interaction profile **should** become current on the corresponding */user/hand/* path if the application has submitted a suggested binding for the corresponding */user/hand/* top level path.

An application **may** use the XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED and change in output value from xrGetCurrentInteractionProfile to determine when the user put down or picked up a controller.

12.148.5. Changes to Action Space Behavior

In some cases, this extension modifies the behavior specified in Resolving a single action bound to multiple inputs or outputs. Specifically, given the following:

- A pose action with both a path under */user/detached_controller_meta* as a sub-action path, as well as the corresponding path under */user/hand*,
- Suggested bindings for that pose action for a single interaction profile on both a binding path under */user/detached_controller_meta/* path and the corresponding binding path under */user/hand/* (e.g. */user/detached_controller_meta/right/input/grip/pose* and */user/hand/right/input/grip/pose*),
- And an action space created for the pose action **without** specifying a sub-action path,

the runtime **should** associate the action space with the appropriate pose on the **controller**, whether it is in-hand or detached. That is, such an action space "follows" the controller. The core specification does not specify any particular behavior for action spaces created without a sub-action path on actions created with sub-action paths, other than not changing the association between calls to xrSyncActions.

A more common practice of defining a pose action with both */user/hand/left* and */user/hand/right* as sub-action paths does **not** change behavior with this extension. That is, if the application creates an action space from such a pose action, without passing a sub-action path to xrCreateActionSpace, the runtime **must** choose a single pose source. However, it usually does not make sense to create an action space without specifying a sub-action path for such an action.

12.148.6. Example Usage

Detecting hand/controller modality change per hand:

```
const int NUM_HANDS = 2; // previously defined
XrInstance instance;  // previously initialized
XrSession session;  // previously initialized
XrPath path;  // previously initialized for path in question
XrInteractionProfileState currentState[NUM_HANDS];  // previously initialized for
NUM_HANDS

// In event polling code

// Initialize an event buffer to hold the output.
XrEventDataBuffer event = {
    .type = XR_TYPE_EVENT_DATA_BUFFER,
};
XrResult result = xrPollEvent(instance, &event);
if (result == XR_SUCCESS) {

  // ...

  switch (event.type) {
    case XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED: {
      for (int handIndex = 0; handIndex < NUM_HANDS; ++handIndex) {
        XrInteractionProfileState profileState {
            .type = XR_TYPE_INTERACTION_PROFILE_STATE,
        };
        CHK_XR(xrGetCurrentInteractionProfile(session, path, &profileState));

        // Inspect profileState to understand if this hand is now holding a
        // controller, or if the controller has been placed somewhere
        if (currentState[handIndex].interactionProfile != profileState.
interactionProfile) {

            // Log state change, etc
            // LOG_OUT("Detected state change in {} from {} to {}", handIndex,
            //         currentState[handIndex].interactionProfile,
            //         profileState.interactionProfile);

            // Do whatever processing is required when this state has changed
        }
      }

      break;
    }
  }
}
```

Accessing data is effectively the same as existing hands and controllers input code, except that we no

longer make the (invalid) assumption that both */user/hand/left* and */user/hand/right* are the same modality.

Detecting controller locations when not in hands

Suggest interaction profile bindings for the use cases your app cares about. For an app that cares about detached controllers, you can set up bindings for either of the in-hand case or detached case, or both together.

For example, for many controllers you might suggest the following bindings with XrInteractionProfileSuggestedBinding:

- `LeftControllerPose` → */user/hand/left/grip/pose*
- `LeftControllerPose` → */user/detached_controller_meta/left/grip/pose*
- `LeftControllerDetachedOnly` → */user/detached_controller_meta/left/grip/pose*

```
XrSpace leftControllerSpace = XR_NULL_HANDLE;
XrSpace detachedLeftControllerSpace = XR_NULL_HANDLE;
XrActionSpaceCreateInfo asci{
    .type = XR_TYPE_ACTION_SPACE_CREATE_INFO,
    .next = nullptr,
    .action = LeftControllerPose,
};
CHK_XR(xrCreateActionSpace(session, &asci, &leftControllerSpace));
asci.action = LeftControllerDetachedOnly;
CHK_XR(xrCreateActionSpace(session, &asci, &
detachedLeftControllerSpace));

// Will follow controller whether in hand or detached
CHK_XR(xrLocateSpace(leftControllerSpace, /* ... */));

// Only valid data when controller is detached:
CHK_XR(xrLocateSpace(detachedLeftControllerSpace, /* ... */));

// Note that any bindings that work on /user/hand/left will work
// for /user/detached_controller_meta/left, and they can be
// combined by the app on an action to action basis.
```

Using the same controller pose when in hand as when detached with hands

The two extensions can be brought together to have a controller pose that follows the controller when detached, and a hand pose that flips from tracking the controller to tracking the hand when the controller is put down

For example, suggest bindings for */interaction_profiles/oculus/touch_controller* as follows with xrSuggestInteractionProfileBindings:

- `LeftControllerPose` → */user/hand/left/grip/pose*
- `LeftControllerPose` → */user/detached_controller_meta/left/grip/pose*
- `LeftHandPose` → */user/hand/left/grip/pose*

Further, suggest bindings for */interaction_profiles/ext/hand_interaction* as follows with xrSuggestInteractionProfileBindings:

- `LeftHandPose` → */user/hand/left/grip/pose*

Proceed with usage similar to above. When controllers are in hand, the binding source for */user/hand/left/grip/pose* path provides controller-based data to both `LeftControllerPose` and `LeftHandPose`.

When controllers are placed on a surface, the application will receive the `XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED` event. From this point on, `LeftHandPose` will be powered by hand data bound to */user/hand/left/grip/pose*, and the `LeftControllerPose` will still be powered by controller data bound to */user/detached_controller_meta/left/grip/pose*

Note that the same can be done for actions; `ButtonClickAction` could seamlessly transition from a controller trigger to a finger pinch when you put down the controllers, for example.

12.149.1. Overview

This extension allows the application to request depth maps of the real-world environment around the headset. The depth maps are generated by the runtime and shared with the application using an XrEnvironmentDepthSwapchainMETA.

12.149.2. Inspect System Capability

The XrSystemEnvironmentDepthPropertiesMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrSystemEnvironmentDepthPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsEnvironmentDepth;
    XrBool32           supportsHandRemoval;
} XrSystemEnvironmentDepthPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `supportsEnvironmentDepth` is an `XrBool32` indicating if current system supports environment depth.
- `supportsHandRemoval` is an `XrBool32` indicating if current system supports hand removal.

An application **can** inspect whether the system is capable of supporting environment depth by extending the XrSystemProperties with XrSystemEnvironmentDepthPropertiesMETA structure when calling xrGetSystemProperties.

If and only if a runtime returns `XR_FALSE` for `supportsEnvironmentDepth`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateEnvironmentDepthProviderMETA.

If and only if a runtime returns `XR_FALSE` for `supportsHandRemoval`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrSetEnvironmentDepthHandRemovalMETA.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrSystemEnvironmentDepthPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_ENVIRONMENT_DEPTH_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.149.3. Creating and Destroying a Depth Provider

```
// Provided by XR_META_environment_depth
XR_DEFINE_HANDLE(XrEnvironmentDepthProviderMETA)
```

An XrEnvironmentDepthProviderMETA is a handle to a depth provider.

The xrCreateEnvironmentDepthProviderMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrCreateEnvironmentDepthProviderMETA(
    XrSession                                   session,
    const XrEnvironmentDepthProviderCreateInfoMETA* createInfo,
    XrEnvironmentDepthProviderMETA*             environmentDepthProvider);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is a pointer to an XrEnvironmentDepthProviderCreateInfoMETA containing creation options for the depth provider.
- `environmentDepthProvider` is the returned XrEnvironmentDepthProviderMETA handle for the created depth provider.

The xrCreateEnvironmentDepthProviderMETA function creates a depth provider instance.

Creating the depth provider **may** allocate resources, but **should** not incur any per-frame compute costs until the provider has been started.

- Runtimes **must** create the provider in a stopped state.
- Runtimes **may** limit the number of depth providers per XrInstance. If xrCreateEnvironmentDepthProviderMETA fails due to reaching this limit, the runtime **must** return `XR_ERROR_LIMIT_REACHED`.
- Runtimes **must** support at least 1 provider per XrInstance.
- Runtimes **may** return `XR_ERROR_NOT_PERMITTED_PASSTHROUGH_FB` if the app permissions have not been granted to the calling app.
- Applications **can** call xrStartEnvironmentDepthProviderMETA to start the generation of depth maps.

Valid Usage (Implicit)

- The XR_META_environment_depth extension **must** be enabled prior to calling xrCreateEnvironmentDepthProviderMETA
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrEnvironmentDepthProviderCreateInfoMETA structure
- environmentDepthProvider **must** be a pointer to an XrEnvironmentDepthProviderMETA handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_NOT_PERMITTED_PASSTHROUGH_FB
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentDepthProviderCreateInfoMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthProviderCreateInfoMETA {
    XrStructureType                               type;
    const void*                                   next;
    XrEnvironmentDepthProviderCreateFlagsMETA     createFlags;
} XrEnvironmentDepthProviderCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `createFlags` is `0` or one or more XrEnvironmentDepthProviderCreateFlagBitsMETA.

The XrEnvironmentDepthProviderCreateInfoMETA structure provides creation options for the XrEnvironmentDepthProviderMETA when passed to xrCreateEnvironmentDepthProviderMETA.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthProviderCreateInfoMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_PROVIDER_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `createFlags` **must** be `0`

The XrEnvironmentDepthProviderCreateFlagsMETA specifies creation options for XrEnvironmentDepthProviderMETA.

```
// Provided by XR_META_environment_depth
typedef XrFlags64 XrEnvironmentDepthProviderCreateFlagsMETA;
```

Valid bits for XrEnvironmentDepthProviderCreateFlagsMETA are defined by XrEnvironmentDepthProviderCreateFlagBitsMETA, which is specified as:

```
// Provided by XR_META_environment_depth
// Flag bits for XrEnvironmentDepthProviderCreateFlagsMETA
```

There are currently no flag bits defined. This is reserved for future use.

The xrDestroyEnvironmentDepthProviderMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrDestroyEnvironmentDepthProviderMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider);
```

Parameter Descriptions

- `environmentDepthProvider` is an XrEnvironmentDepthProviderMETA handle for the depth provider.

The xrDestroyEnvironmentDepthProviderMETA function destroys the depth provider. After this call the runtime **may** free all related memory and resources.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrDestroyEnvironmentDepthProviderMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle

Thread Safety

- Access to `environmentDepthProvider`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

12.149.4. Starting and Stopping a Depth Provider

The xrStartEnvironmentDepthProviderMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrStartEnvironmentDepthProviderMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider);
```

Parameter Descriptions

- `environmentDepthProvider` is an XrEnvironmentDepthProviderMETA handle for the depth provider.

The xrStartEnvironmentDepthProviderMETA function starts the asynchronous generation of depth maps.

Starting the depth provider **may** use CPU and GPU resources.

Runtimes **must** return `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB` if xrStartEnvironmentDepthProviderMETA is called on an already started XrEnvironmentDepthProviderMETA.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrStartEnvironmentDepthProviderMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB`

The xrStopEnvironmentDepthProviderMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrStopEnvironmentDepthProviderMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider);
```

Parameter Descriptions

- `environmentDepthProvider` is an XrEnvironmentDepthProviderMETA handle for the depth provider.

The xrStopEnvironmentDepthProviderMETA function stops the generation of depth maps. This stops all per frame computation of environment depth for the application.

Runtimes **must** return `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB` if xrStopEnvironmentDepthProviderMETA is called on an already stopped XrEnvironmentDepthProviderMETA.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrStopEnvironmentDepthProviderMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_UNEXPECTED_STATE_PASSTHROUGH_FB`

12.149.5. Hand Removal

Runtimes **may** provide functionality to remove hands from the depth map and filling in estimated background depth values. This is useful to support other occlusion methods specialized for hands to coexist with the Environment Depth extension.

The xrSetEnvironmentDepthHandRemovalMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrSetEnvironmentDepthHandRemovalMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider,
    const XrEnvironmentDepthHandRemovalSetInfoMETA* setInfo);
```

Parameter Descriptions

- `environmentDepthProvider` is an XrEnvironmentDepthProviderMETA handle for the depth provider.
- `setInfo` is a pointer to an XrEnvironmentDepthHandRemovalSetInfoMETA containing options for the hand removal.

The xrSetEnvironmentDepthHandRemovalMETA function sets hand removal options.

Runtimes **should** enable or disable the removal of the hand depths from the depth map. If enabled, the corresponding depth pixels **should** be replaced with the estimated background depth behind the hands. Runtimes **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if and only if XrSystemEnvironmentDepthPropertiesMETA::`supportsHandRemoval` is `XR_FALSE`.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrSetEnvironmentDepthHandRemovalMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle
- `setInfo` **must** be a pointer to a valid XrEnvironmentDepthHandRemovalSetInfoMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentDepthHandRemovalSetInfoMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthHandRemovalSetInfoMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           enabled;
} XrEnvironmentDepthHandRemovalSetInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- enabled is XR_TRUE or XR_FALSE to enable/disable hand removal from the depth map, respectively.

This structure contains options passed to xrSetEnvironmentDepthHandRemovalMETA.

Valid Usage (Implicit)

- The XR_META_environment_depth extension **must** be enabled prior to using XrEnvironmentDepthHandRemovalSetInfoMETA
- type **must** be XR_TYPE_ENVIRONMENT_DEPTH_HAND_REMOVAL_SET_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.149.6. Creating a Readable Depth Swapchain

The depth data is generated in the runtime and shared to the application though an XrEnvironmentDepthSwapchainMETA. This swapchain is different from regular swapchains in that it provides a data channel from the runtime to the application instead of the other way around.

```
// Provided by XR_META_environment_depth
XR_DEFINE_HANDLE(XrEnvironmentDepthSwapchainMETA)
```

XrEnvironmentDepthSwapchainMETA is a handle to a readable depth swapchain.

The xrCreateEnvironmentDepthSwapchainMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrCreateEnvironmentDepthSwapchainMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider,
    const XrEnvironmentDepthSwapchainCreateInfoMETA* createInfo,
    XrEnvironmentDepthSwapchainMETA*            swapchain);
```

Parameter Descriptions

- environmentDepthProvider is an XrEnvironmentDepthProviderMETA handle for the depth provider.
- createInfo is a pointer to an XrEnvironmentDepthSwapchainCreateInfoMETA containing creation options for the swapchain.
- swapchain is the returned XrEnvironmentDepthSwapchainMETA handle for the created swapchain.

The xrCreateEnvironmentDepthSwapchainMETA function creates a readable swapchain, which is used for accessing the depth data.

The runtime decides on the resolution and length of the swapchain. Additional information about the swapchain **can** be accessed by calling xrGetEnvironmentDepthSwapchainStateMETA.

Runtimes **must** create a swapchain with array textures of length 2, which map to a left-eye and right-eye view. View index 0 **must** represent the left eye and view index 1 **must** represent the right eye. This is the same convention as for `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_STEREO` in XrViewConfigurationType. Runtimes **must** create the swapchain with the following image formats depending on the graphics API associated with the session:

- OpenGL: `GL_DEPTH_COMPONENT16`
- Vulkan: `VK_FORMAT_D16_UNORM`
- Direct3D: `DXGI_FORMAT_D16_UNORM`

Runtimes **must** only allow maximum one swapchain to exist per depth provider at any given time, and must return `XR_ERROR_LIMIT_REACHED` if xrCreateEnvironmentDepthSwapchainMETA is called to create more. Applications **should** destroy the swapchain when no longer needed. Applications **must** be able to handle different swapchain lengths and resolutions.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrCreateEnvironmentDepthSwapchainMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle
- `createInfo` **must** be a pointer to a valid XrEnvironmentDepthSwapchainCreateInfoMETA structure
- `swapchain` **must** be a pointer to an XrEnvironmentDepthSwapchainMETA handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentDepthSwapchainCreateInfoMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthSwapchainCreateInfoMETA {
    XrStructureType                                type;
    const void*                                    next;
    XrEnvironmentDepthSwapchainCreateFlagsMETA     createFlags;
} XrEnvironmentDepthSwapchainCreateInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- createFlags is a bitmask of XrEnvironmentDepthSwapchainCreateFlagBitsMETA.

XrEnvironmentDepthSwapchainCreateInfoMETA contains creation options for the readable depth swapchain, and is passed to xrCreateEnvironmentDepthSwapchainMETA.

Valid Usage (Implicit)

- The XR_META_environment_depth extension **must** be enabled prior to using XrEnvironmentDepthSwapchainCreateInfoMETA
- type **must** be XR_TYPE_ENVIRONMENT_DEPTH_SWAPCHAIN_CREATE_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- createFlags **must** be 0

The XrEnvironmentDepthSwapchainCreateFlagsMETA specifies creation options for XrEnvironmentDepthSwapchainCreateInfoMETA.

```
// Provided by XR_META_environment_depth
typedef XrFlags64 XrEnvironmentDepthSwapchainCreateFlagsMETA;
```

Valid bits for XrEnvironmentDepthProviderCreateFlagsMETA are defined by XrEnvironmentDepthSwapchainCreateFlagBitsMETA, which is specified as:

```
// Provided by XR_META_environment_depth
// Flag bits for XrEnvironmentDepthSwapchainCreateFlagsMETA
```

There are currently no flag bits defined. This is reserved for future use.

The xrGetEnvironmentDepthSwapchainStateMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrGetEnvironmentDepthSwapchainStateMETA(
    XrEnvironmentDepthSwapchainMETA             swapchain,
    XrEnvironmentDepthSwapchainStateMETA*       state);
```

Parameter Descriptions

- swapchain is an XrEnvironmentDepthSwapchainMETA handle.
- state is a pointer to an XrEnvironmentDepthSwapchainStateMETA.

xrGetEnvironmentDepthSwapchainStateMETA retrieves information about the XrEnvironmentDepthSwapchainMETA. This information is constant throughout the lifetime of the XrEnvironmentDepthSwapchainMETA.

Valid Usage (Implicit)

- The XR_META_environment_depth extension **must** be enabled prior to calling xrGetEnvironmentDepthSwapchainStateMETA
- `swapchain` **must** be a valid XrEnvironmentDepthSwapchainMETA handle
- `state` **must** be a pointer to an XrEnvironmentDepthSwapchainStateMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentDepthSwapchainStateMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthSwapchainStateMETA {
    XrStructureType    type;
    void*              next;
    uint32_t           width;
    uint32_t           height;
} XrEnvironmentDepthSwapchainStateMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `width` is the width of the image.
- `height` is the height of the image.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthSwapchainStateMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_SWAPCHAIN_STATE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrDestroyEnvironmentDepthSwapchainMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrDestroyEnvironmentDepthSwapchainMETA(
    XrEnvironmentDepthSwapchainMETA             swapchain);
```

Parameter Descriptions

- `swapchain` is the XrEnvironmentDepthSwapchainMETA to be destroyed.

The xrDestroyEnvironmentDepthSwapchainMETA function destroys a readable environment depth swapchain.

All submitted graphics API commands that refer to `swapchain` **must** have completed execution. Runtimes **may** continue to utilize swapchain images after xrDestroyEnvironmentDepthSwapchainMETA is called.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrDestroyEnvironmentDepthSwapchainMETA
- `swapchain` **must** be a valid XrEnvironmentDepthSwapchainMETA handle

Thread Safety

- Access to `swapchain`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

12.149.7. Accessing the Readable Depth Swapchain During Rendering

The xrEnumerateEnvironmentDepthSwapchainImagesMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrEnumerateEnvironmentDepthSwapchainImagesMETA(
    XrEnvironmentDepthSwapchainMETA             swapchain,
    uint32_t                                    imageCapacityInput,
    uint32_t*                                   imageCountOutput,
    XrSwapchainImageBaseHeader*                 images);
```

Parameter Descriptions

- `swapchain` is the XrEnvironmentDepthSwapchainMETA to get images from.
- `imageCapacityInput` is the capacity of the images array, or 0 to indicate a request to retrieve the required capacity.
- `imageCountOutput` is a pointer to the count of images written, or a pointer to the required capacity in the case that `imageCapacityInput` is insufficient.
- `images` is a pointer to an array of graphics API-specific XrSwapchainImage structures, all of the same type, based on XrSwapchainImageBaseHeader. It **can** be `NULL` if `imageCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `images` size.

xrEnumerateEnvironmentDepthSwapchainImagesMETA fills an array of graphics API-specific XrSwapchainImage* structures derived from XrSwapchainImageBaseHeader. The resources **must** be constant and valid for the lifetime of the XrEnvironmentDepthSwapchainMETA. This function behaves analogously to xrEnumerateSwapchainImages.

Runtimes **must** always return identical buffer contents from this enumeration for the lifetime of the swapchain.

Note: images is a pointer to an array of structures of graphics API-specific type, not an array of structure pointers.

The pointer submitted as images will be treated as an array of the expected graphics API-specific type based on the graphics API used at session creation time. If the type member of any array element accessed in this way does not match the expected value, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

Valid Usage (Implicit)

- The XR_META_environment_depth extension **must** be enabled prior to calling xrEnumerateEnvironmentDepthSwapchainImagesMETA
- swapchain **must** be a valid XrEnvironmentDepthSwapchainMETA handle
- imageCountOutput **must** be a pointer to a uint32_t value
- If imageCapacityInput is not 0, images **must** be a pointer to an array of imageCapacityInput XrSwapchainImageBaseHeader-based structures. See also: XrSwapchainImageD3D11KHR, XrSwapchainImageD3D12KHR, XrSwapchainImageMetalKHR, XrSwapchainImageOpenGLESKHR, XrSwapchainImageOpenGLKHR, XrSwapchainImageVulkanKHR

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrAcquireEnvironmentDepthImageMETA function is defined as:

```
// Provided by XR_META_environment_depth
XrResult xrAcquireEnvironmentDepthImageMETA(
    XrEnvironmentDepthProviderMETA              environmentDepthProvider,
    const XrEnvironmentDepthImageAcquireInfoMETA* acquireInfo,
    XrEnvironmentDepthImageMETA*                environmentDepthImage);
```

Parameter Descriptions

- environmentDepthProvider is an XrEnvironmentDepthProviderMETA handle for the depth provider.
- acquireInfo is an XrEnvironmentDepthImageAcquireInfoMETA containing parameters for populating a depth swapchain image.
- environmentDepthImage is the returned XrEnvironmentDepthImageMETA containing information about the acquired depth image.

Acquires the latest available swapchain image that has been generated by the depth provider and ensures it is ready to be accessed by the application. The application **may** access and queue GPU operations using the acquired image until the next xrEndFrame call, when the image is released and the depth provider **may** write new depth data into it after completion of all work queued before the xrEndFrame call.

The returned XrEnvironmentDepthImageMETA contains the swapchain index into the array enumerated by xrEnumerateEnvironmentDepthSwapchainImagesMETA. It also contains other information such as the field of view and pose that are necessary to interpret the depth data.

There **must** be no more than one call to xrAcquireEnvironmentDepthImageMETA between any pair of corresponding xrBeginFrame and xrEndFrame calls in a session.

- The runtime **may** block if previously acquired swapchain images are still being used by the graphics API.
- The runtime **must** return `XR_ERROR_CALL_ORDER_INVALID` if xrAcquireEnvironmentDepthImageMETA is called before xrBeginFrame or after xrEndFrame.
- The runtime **must** return `XR_ERROR_CALL_ORDER_INVALID` if xrAcquireEnvironmentDepthImageMETA is called on a stopped XrEnvironmentDepthProviderMETA.
- The runtime **must** return `XR_ERROR_LIMIT_REACHED` if xrAcquireEnvironmentDepthImageMETA is called more than once per frame - i.e. in a running session, after a call to xrBeginFrame that has not had an associated xrEndFrame.
- Runtimes **must** return `XR_ENVIRONMENT_DEPTH_NOT_AVAILABLE_META` if no depth frame is available yet (i.e. the provider was recently started and did not yet have time to compute depth). Note that this is a success code. In this case the output parameters **must** be unchanged.
- The application **must** not utilize the swapchain image in calls to the graphics API after xrEndFrame has been called.
- A runtime **may** use the graphics API specific contexts provided to OpenXR. In particular:
  - For OpenGL, a runtime **may** use the OpenGL context specified in the call to xrCreateSession, which needs external synchronization.
  - For Vulkan, a runtime **may** use the `VkQueue` specified in the XrGraphicsBindingVulkan2KHR, which needs external synchronization.
  - For Direct3D12, a runtime **may** use the `ID3D12CommandQueue` specified in the XrGraphicsBindingD3D12KHR, which needs external synchronization.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to calling xrAcquireEnvironmentDepthImageMETA
- `environmentDepthProvider` **must** be a valid XrEnvironmentDepthProviderMETA handle
- `acquireInfo` **must** be a pointer to a valid XrEnvironmentDepthImageAcquireInfoMETA structure
- `environmentDepthImage` **must** be a pointer to an XrEnvironmentDepthImageMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_ENVIRONMENT_DEPTH_NOT_AVAILABLE_META
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentDepthImageAcquireInfoMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthImageAcquireInfoMETA {
    XrStructureType    type;
    const void*        next;
    XrSpace            space;
    XrTime             displayTime;
} XrEnvironmentDepthImageAcquireInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is an XrSpace defining the reference frame of the returned pose in XrEnvironmentDepthImageMETA.
- `displayTime` is an `XrTime` specifying the time used to compute the pose for the returned pose in XrEnvironmentDepthImageMETA. Clients **should** pass their predicted display time for the current frame.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthImageAcquireInfoMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_IMAGE_ACQUIRE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle

The XrEnvironmentDepthImageViewMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthImageViewMETA {
    XrStructureType    type;
    const void*        next;
    XrFovf             fov;
    XrPosef            pose;
} XrEnvironmentDepthImageViewMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `fov` is an XrFovf specifying the field of view used to generate this view. The view is never flipped horizontally nor vertically.
- `pose` is an XrPosef specifying the pose from which the depth map was rendered. The reference frame is specified in XrEnvironmentDepthImageAcquireInfoMETA.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthImageViewMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_IMAGE_VIEW_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEnvironmentDepthImageMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthImageMETA {
    XrStructureType                   type;
    const void*                       next;
    uint32_t                          swapchainIndex;
    float                             nearZ;
    float                             farZ;
    XrEnvironmentDepthImageViewMETA   views[2];
} XrEnvironmentDepthImageMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `swapchainIndex` is the index of the acquired texture in the depth swapchain.
- `nearZ` is the distance to the near Z plane in meters.
- `farZ` is the distance to the far Z plane in meters.
- `views` is an array of two XrEnvironmentDepthImageViewMETA, one for each eye, where index 0 is left eye and index 1 is the right eye.

Depth is provided as textures in the same format as described in the `XR_KHR_composition_layer_depth` extension.

The frustum's Z-planes are placed at `nearZ` and `farZ` meters. When `farZ` is less than `nearZ`, an infinite projection matrix is used.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthImageMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_IMAGE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrEnvironmentDepthImageTimestampMETA
- Any given element of `views` **must** be a valid XrEnvironmentDepthImageViewMETA structure

The XrEnvironmentDepthImageTimestampMETA structure is defined as:

```
// Provided by XR_META_environment_depth
typedef struct XrEnvironmentDepthImageTimestampMETA {
    XrStructureType    type;
    const void*        next;
    XrTime             captureTime;
} XrEnvironmentDepthImageTimestampMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `captureTime` is an `XrTime` specifying when the depth image was captured.

The XrEnvironmentDepthImageTimestampMETA structure provides timestamp information for environment depth data. This structure **can** be chained to XrEnvironmentDepthImageMETA to provide temporal context for the depth information.

The `captureTime` field indicates the capture time of the images used to reconstruct the environment depth map.

Applications **can** use this timestamp information for latency measurements and synchronization with other time-based data such as passthrough camera.

If present in the structure chain, this structure **must** be populated by the runtime if and only if the runtime reports version 2 or greater of this extension. This is an "unknown structure" to runtimes reporting version 1 of this extension, and is therefore ignored/unmodified according to Valid Usage for Structure Pointer Chains.

Applications **should** initialize `captureTime` to 0 before chaining this structure and calling xrAcquireEnvironmentDepthImageMETA. After the call, a non-zero value in `captureTime` indicates that the runtime has populated the timestamp field.

Valid Usage (Implicit)

- The `XR_META_environment_depth` extension **must** be enabled prior to using XrEnvironmentDepthImageTimestampMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_DEPTH_IMAGE_TIMESTAMP_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.149.8. Vulkan Swapchain Image Layout

For an application using Vulkan, after a successful call to xrAcquireEnvironmentDepthImageMETA that does **not** return `XR_ENVIRONMENT_DEPTH_NOT_AVAILABLE_META`, the following conditions apply to the **runtime**:

- The runtime **must** ensure the acquired readable depth swapchain image has a memory layout compatible with `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`. **Note** that this is different from xrAcquireSwapchainImage which guarantees `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`.

- The runtime **must** ensure the VkQueue specified in XrGraphicsBindingVulkanKHR / XrGraphicsBindingVulkan2KHR has ownership of the acquired readable depth swapchain image.

Upon next calling xrEndFrame after such an acquire call, the following conditions apply to the **application**:

- The application **must** ensure that the readable depth swapchain image has a memory layout compatible with VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.
- The application **must** ensure that the readable depth swapchain image is owned by the VkQueue specified in XrGraphicsBindingVulkanKHR / XrGraphicsBindingVulkan2KHR.

The application is responsible for transitioning the swapchain image back to the image layout and queue ownership that the OpenXR runtime requires. If the image is not in a layout compatible with the above specifications, the runtime **may** exhibit undefined behavior.

12.149.9. Direct3D 12 Swapchain Image Resource State

For an application using D3D12, after a successful call to xrAcquireEnvironmentDepthImageMETA that does **not** return XR_ENVIRONMENT_DEPTH_NOT_AVAILABLE_META, the following conditions apply to the **runtime**:

- The runtime **must** ensure the acquired readable depth swapchain image has a resource state match with D3D12_RESOURCE_STATE_ALL_SHADER_RESOURCE. **Note** that this is different from xrAcquireSwapchainImage which guarantees D3D12_RESOURCE_STATE_DEPTH_WRITE for swapchain images with depth formats.
- The runtime **must** ensure that the ID3D12CommandQueue specified in XrGraphicsBindingD3D12KHR **may** read from the acquired readable depth swapchain image.

Upon next calling xrEndFrame after such an acquire call, the following conditions apply to the **application**:

- The application **must** ensure that the readable depth swapchain image has a resource state match with D3D12_RESOURCE_STATE_ALL_SHADER_RESOURCE.
- The application **must** ensure that the readable depth swapchain image is available for read/write on the ID3D12CommandQueue specified in XrGraphicsBindingD3D12KHR.

The application is responsible for transitioning the swapchain image back to the resource state and queue availability that the OpenXR runtime requires. If the image is not in a resource state match with the above specifications the runtime **may** exhibit undefined behavior.

Version History

- Revision 1, 2023-08-24 (Daniel Henell)
  - Initial extension description
- Revision 2, 2025-09-19 (Martin Sherburn)

- Add support for accessing capture time stamps for depth images.

12.150.1. Overview

The `XR_META_environment_raycast` extension allows applications to perform raycast operations against the surrounding physical environment.

Given a ray origin and a direction, this extension searches along the ray to determine where the ray first intersects with the environment. Optionally, the application applies filters to refine the search results.

The application **must** also enable the `XR_EXT_future` extension in order to use this extension. Otherwise

xrCreateInstance **must** return XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED.

12.150.2. Inspect system capability

The XrSystemEnvironmentRaycastPropertiesMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrSystemEnvironmentRaycastPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsEnvironmentRaycast;
} XrSystemEnvironmentRaycastPropertiesMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- supportsEnvironmentRaycast is an XrBool32, indicating if current system is capable of performing environment raycast.

An application **can** inspect whether the system is capable of performing environment raycasts by extending the XrSystemProperties with an XrSystemEnvironmentRaycastPropertiesMETA structure when calling xrGetSystemProperties.

If and only if a runtime returns XR_FALSE for supportsEnvironmentRaycast, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrCreateEnvironmentRaycasterAsyncMETA.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to using XrSystemEnvironmentRaycastPropertiesMETA
- type **must** be XR_TYPE_SYSTEM_ENVIRONMENT_RAYCAST_PROPERTIES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.150.3. Create an environment raycaster

The XrEnvironmentRaycasterMETA handle represents the resources used to perform environment raycast operations. It is valid until destroyed via xrDestroyEnvironmentRaycasterMETA.

```
// Provided by XR_META_environment_raycast
XR_DEFINE_HANDLE(XrEnvironmentRaycasterMETA)
```

The runtime **must** have an active environment raycaster handle created by the application before providing any raycast hit info.

The xrCreateEnvironmentRaycasterAsyncMETA function is defined as:

```
// Provided by XR_META_environment_raycast
XrResult xrCreateEnvironmentRaycasterAsyncMETA(
    XrSession                                   session,
    const XrEnvironmentRaycasterCreateInfoMETA* info,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- `session` is an XrSession in which the environment raycaster will be active.
- `info` is the XrEnvironmentRaycasterCreateInfoMETA used to create the raycaster.
- `future` is a pointer to an `XrFutureEXT`.

This function starts an asynchronous operation and creates a corresponding `XrFutureEXT`, usable with xrPollFutureEXT and related functions. The return value of this function only indicates whether the parameters were acceptable to schedule the asynchronous operation. The corresponding completion function is xrCreateEnvironmentRaycasterCompleteMETA, usable when a future from this function is in the READY state, with outputs populated by that function in the completion structure XrEnvironmentRaycasterCreateCompletionMETA.

Runtimes **may** initialize needed resources to perform raycast operations during this asynchronous call.

If the system does not support environment raycast operations, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateEnvironmentRaycasterAsyncMETA. In this case, the runtime **must** return `XR_FALSE` for XrSystemEnvironmentRaycastPropertiesMETA ::`supportsEnvironmentRaycast` when the function xrGetSystemProperties is called, so that the application **can** avoid attempting to create an environment raycaster.

Valid Usage (Implicit)

- The `XR_META_environment_raycast` extension **must** be enabled prior to calling xrCreateEnvironmentRaycasterAsyncMETA
- `session` **must** be a valid XrSession handle
- If `info` is not `NULL`, `info` **must** be a pointer to a valid XrEnvironmentRaycasterCreateInfoMETA structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_PERMISSION_INSUFFICIENT`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrEnvironmentRaycasterCreateInfoMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycasterCreateInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrEnvironmentRaycasterCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrEnvironmentRaycasterCreateInfoMETA structure describes the information to create an environment raycaster and respective XrEnvironmentRaycasterMETA handle.

Valid Usage (Implicit)

- The `XR_META_environment_raycast` extension **must** be enabled prior to using XrEnvironmentRaycasterCreateInfoMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_RAYCASTER_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrCreateEnvironmentRaycasterCompleteMETA function is defined as:

```
// Provided by XR_META_environment_raycast
XrResult xrCreateEnvironmentRaycasterCompleteMETA(
    XrSession                                   session,
    XrFutureEXT                                 future,
    XrEnvironmentRaycasterCreateCompletionMETA* completion);
```

Parameter Descriptions

- `session` is an XrSession in which the environment raycaster will be active.
- `future` is the `XrFutureEXT` received from xrCreateEnvironmentRaycasterAsyncMETA.
- `completion` is a pointer to an XrEnvironmentRaycasterCreateCompletionMETA.

This is the completion function corresponding to xrCreateEnvironmentRaycasterAsyncMETA. It completes the asynchronous operation and returns the results. Do not call until the `future` is READY.

The runtime **must** return `XR_ERROR_FUTURE_PENDING_EXT` if `future` is not in the READY state. The runtime **must** return `XR_ERROR_FUTURE_INVALID_EXT` if `future` has already been completed or cancelled.

Valid Usage (Implicit)

- The `XR_META_environment_raycast` extension **must** be enabled prior to calling xrCreateEnvironmentRaycasterCompleteMETA
- `session` **must** be a valid XrSession handle
- `completion` **must** be a pointer to an XrEnvironmentRaycasterCreateCompletionMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_FUTURE_INVALID_EXT`
- `XR_ERROR_FUTURE_PENDING_EXT`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INITIALIZATION_FAILED`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SESSION_NOT_RUNNING`
- `XR_ERROR_VALIDATION_FAILURE`

The XrEnvironmentRaycasterCreateCompletionMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycasterCreateCompletionMETA {
    XrStructureType               type;
    void*                         next;
    XrResult                      futureResult;
    XrEnvironmentRaycasterMETA    environmentRaycaster;
} XrEnvironmentRaycasterCreateCompletionMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `futureResult` is the XrResult of the environment raycaster creation operation.
- `environmentRaycaster` is the returned XrEnvironmentRaycasterMETA handle.

Future Return Codes

XrEnvironmentRaycasterCreateCompletionMETA::`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_FUNCTION_UNSUPPORTED`

The XrEnvironmentRaycasterCreateCompletionMETA structure stores the result of the environment raycaster creation.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to using XrEnvironmentRaycasterCreateCompletionMETA
- type **must** be XR_TYPE_ENVIRONMENT_RAYCASTER_CREATE_COMPLETION_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- futureResult **must** be a valid XrResult value
- environmentRaycaster **must** be a valid XrEnvironmentRaycasterMETA handle

12.150.4. Performing an environment raycast operation

The xrPerformEnvironmentRaycastMETA function is defined as:

```
// Provided by XR_META_environment_raycast
XrResult xrPerformEnvironmentRaycastMETA(
    XrEnvironmentRaycasterMETA                environmentRaycaster,
    const XrEnvironmentRaycastHitGetInfoMETA*  info,
    XrEnvironmentRaycastHitMETA*               hitPoint);
```

Parameter Descriptions

- environmentRaycaster is an XrEnvironmentRaycasterMETA previously created by xrCreateEnvironmentRaycasterAsyncMETA.
- info is a pointer to an XrEnvironmentRaycastHitGetInfoMETA describing the ray to cast.
- hitPoint is a pointer to XrEnvironmentRaycastHitMETA that the runtime fills with information about where the closest hit is, if found.

The xrPerformEnvironmentRaycastMETA function is used by the application to perform an environment raycast operation.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to calling xrPerformEnvironmentRaycastMETA
- environmentRaycaster **must** be a valid XrEnvironmentRaycasterMETA handle
- info **must** be a pointer to a valid XrEnvironmentRaycastHitGetInfoMETA structure
- hitPoint **must** be a pointer to an XrEnvironmentRaycastHitMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrEnvironmentRaycastHitGetInfoMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycastHitGetInfoMETA {
    XrStructureType                                         type;
    const void*                                             next;
    XrSpace                                                 baseSpace;
    XrTime                                                  time;
    XrVector3f                                              origin;
    XrVector3f                                              direction;
    uint32_t                                                filterCount;
    const XrEnvironmentRaycastFilterBaseHeaderMETA* const *    filters;
} XrEnvironmentRaycastHitGetInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is the XrSpace in which all the following locations in this struct will be located in.
- `time` is the `XrTime` at which all the following locations in this struct will be located.
- `origin` is an XrVector3f which describes the starting point for the ray.
- `direction` is an XrVector3f which describes the direction of the ray.
- `filterCount` is the number of filters that are passed in the `filters` parameter.
- `filters` is a pointer to an array of XrEnvironmentRaycastFilterBaseHeaderMETA pointers.

The XrEnvironmentRaycastHitGetInfoMETA structure describes a ray to cast.

Valid Usage (Implicit)

- The `XR_META_environment_raycast` extension **must** be enabled prior to using XrEnvironmentRaycastHitGetInfoMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_RAYCAST_HIT_GET_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle
- If `filterCount` is not `0`, `filters` **must** be a pointer to an array of `filterCount` valid XrEnvironmentRaycastFilterBaseHeaderMETA-based structures. See also: XrEnvironmentRaycastFilterDistanceMETA

The XrEnvironmentRaycastFilterBaseHeaderMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycastFilterBaseHeaderMETA {
    XrStructureType    type;
    const void*        next;
} XrEnvironmentRaycastFilterBaseHeaderMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` **must** be `NULL`

The XrEnvironmentRaycastFilterBaseHeaderMETA is meant to be used as the base header for filter types defined in this extension.

Valid Usage (Implicit)

- The `XR_META_environment_raycast` extension **must** be enabled prior to using XrEnvironmentRaycastFilterBaseHeaderMETA
- `type` **must** be `XR_TYPE_ENVIRONMENT_RAYCAST_FILTER_DISTANCE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

One such filter type is defined in this extension: XrEnvironmentRaycastFilterDistanceMETA.

The XrEnvironmentRaycastFilterDistanceMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycastFilterDistanceMETA {
    XrStructureType    type;
    const void*        next;
    float              maxDistance;
} XrEnvironmentRaycastFilterDistanceMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` **must** be `NULL`
- `maxDistance` is the distance in meters to constrain the length of the ray from XrEnvironmentRaycastHitGetInfoMETA::`origin` along XrEnvironmentRaycastHitGetInfoMETA::`direction`.

The XrEnvironmentRaycastFilterDistanceMETA structure contains distance filter information for environment raycast.

If the application provides an XrEnvironmentRaycastFilterDistanceMETA, the runtime **must** constrain the length of the ray from XrEnvironmentRaycastHitGetInfoMETA::`origin` along

XrEnvironmentRaycastHitGetInfoMETA::direction to maxDistance in meters. This means that the runtime **must** not return any hitpoint that is more than XrEnvironmentRaycastFilterDistanceMETA ::maxDistance away from XrEnvironmentRaycastHitGetInfoMETA::origin.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to using XrEnvironmentRaycastFilterDistanceMETA
- type **must** be XR_TYPE_ENVIRONMENT_RAYCAST_FILTER_DISTANCE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEnvironmentRaycastHitMETA structure is defined as:

```
// Provided by XR_META_environment_raycast
typedef struct XrEnvironmentRaycastHitMETA {
    XrStructureType                     type;
    const void*                         next;
    XrEnvironmentRaycastHitStatusMETA   status;
    XrPosef                             pose;
} XrEnvironmentRaycastHitMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next **must** be NULL
- status provides more info about whether a hit point was found, or why it was not found.
- pose is the XrPosef of the hit point in XrEnvironmentRaycastHitGetInfoMETA::baseSpace, if found.

The XrEnvironmentRaycastHitMETA contains information about where the closest hit was found.

The runtime **must** set the XrPosef::position of the pose to the point where the ray specified in XrEnvironmentRaycastHitGetInfoMETA intersected with the environment. If the ray intersects with the environment at multiple points, XrPosef::position **must** be set to the first point of intersection when traveling from XrEnvironmentRaycastHitGetInfoMETA::origin in the XrEnvironmentRaycastHitGetInfoMETA::direction direction.

The XrPosef::orientation of the pose **must** represent the best estimate of the of the normal of the surface hit by the ray. The normal vector is calculated by rotating {0, 0, 1} by this orientation. Rotating the vector {0, 1, 0} with XrPosef::orientation **must** result in a vector that roughly points in the direction of the ray origin.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to using XrEnvironmentRaycastHitMETA
- type **must** be XR_TYPE_ENVIRONMENT_RAYCAST_HIT_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- status **must** be a valid XrEnvironmentRaycastHitStatusMETA value

The XrEnvironmentRaycastHitStatusMETA enumerates the possible status of an attempted environment raycast. XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_META indicates a successful environment raycast with a valid hit point found given the criteria specified in XrEnvironmentRaycastHitGetInfoMETA.

```
// Provided by XR_META_environment_raycast
typedef enum XrEnvironmentRaycastHitStatusMETA {
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_META = 1,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_NO_HIT_META = 2,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OCCLUDED_META = 3,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OUTSIDE_OF_FOV_META = 4,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_RAY_OCCLUDED_META = 5,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_INVALID_ORIENTATION_META = 6,
    XR_ENVIRONMENT_RAYCAST_HIT_STATUS_MAX_ENUM_META = 0x7FFFFFFF
} XrEnvironmentRaycastHitStatusMETA;
```

Enum	Description
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_META	The intersection with the environment is found.
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_NO_HIT_META	The intersection with the environment is not found.
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OCCLUDED_META	The ray intersects with the environment, but the actual hit point is invisible.
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OUTSIDE_OF_FOV_META	The hit point can't be determined because it lies outside of the field of view.
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_RAY_OCCLUDED_META	The ray is completely occluded by the environment.
XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_INVALID_ORIENTATION_META	The intersection with the environment is found, but the hit orientation cannot be determined.

XR_ENVIRONMENT_RAYCAST_HIT_STATUS_NO_HIT_META indicates a failed environment raycast, and none of the pose fields are valid. XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OCCLUDED_META indicates the hit point

is occluded. For example, if you are looking at a screen, the hit point may be on the wall behind it. The pose is still valid and represents the best estimate of the hit point, but it may not be accurate. XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_POINT_OUTSIDE_OF_FOV_META indicates the hit point is outside camera's field of view. The pose is not valid, the application **should** not use it. XR_ENVIRONMENT_RAYCAST_HIT_STATUS_RAY_OCCLUDED_META indicates the input ray is occluded. The pose is not valid, the application **should** not use it. XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_INVALID_ORIENTATION_META indicates a partially successful environment raycast that only the XrPosef::position was determined, but the XrPosef::orientation was unable to be determined, it contains undefined values and the application **should** not use it.

When necessary, the application can instruct users to move to a different viewing point to achieve more accurate raycast results.

12.150.5. Destroy an environment raycaster handle

The xrDestroyEnvironmentRaycasterMETA function is defined as:

```
// Provided by XR_META_environment_raycast
XrResult xrDestroyEnvironmentRaycasterMETA(
    XrEnvironmentRaycasterMETA                  environmentRaycaster);
```

Parameter Descriptions

- environmentRaycaster is an XrEnvironmentRaycasterMETA previously created by xrCreateEnvironmentRaycasterAsyncMETA.

The xrDestroyEnvironmentRaycasterMETA function releases the environmentRaycaster and frees up associated system resources.

Valid Usage (Implicit)

- The XR_META_environment_raycast extension **must** be enabled prior to calling xrDestroyEnvironmentRaycasterMETA
- environmentRaycaster **must** be a valid XrEnvironmentRaycasterMETA handle

Thread Safety

- Access to environmentRaycaster, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.150.6. Example Code

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session; // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr
PFN_xrCreateEnvironmentRaycasterAsyncMETA xrCreateEnvironmentRaycasterAsyncMETA;

    .baseSpace = localSpace,
    .time = time,
    .origin = rayOrigin,
    .direction = rayDirection,
    .filterCount = 1,
```

```
    .filters = filters,
};
XrEnvironmentRaycastHitMETA hitPoint = {
    .type = XR_TYPE_ENVIRONMENT_RAYCAST_HIT_META,
};
CHK_XR(xrPerformEnvironmentRaycastMETA(raycaster, &info, &hitPoint));
if (hitPoint.status == XR_ENVIRONMENT_RAYCAST_HIT_STATUS_HIT_META) {
    // Do something with hitPoint, e.g. place a virtual object
}

// Destroy environment raycaster when no longer needed by the app
CHK_XR(xrDestroyEnvironmentRaycasterMETA(raycaster));
```

12.150.7. New Object Types

- XrEnvironmentRaycasterMETA

12.150.8. New Commands

- xrCreateEnvironmentRaycasterAsyncMETA
- xrCreateEnvironmentRaycasterCompleteMETA
- xrDestroyEnvironmentRaycasterMETA
- xrPerformEnvironmentRaycastMETA

12.150.9. New Structures

- XrEnvironmentRaycastFilterBaseHeaderMETA
- XrEnvironmentRaycastFilterDistanceMETA
- XrEnvironmentRaycastHitGetInfoMETA
- XrEnvironmentRaycastHitMETA
- XrEnvironmentRaycasterCreateCompletionMETA
- XrEnvironmentRaycasterCreateInfoMETA
- Extending XrSystemProperties:
  - XrSystemEnvironmentRaycastPropertiesMETA

12.150.10. New Enums

- XrEnvironmentRaycastHitStatusMETA

12.150.11. New Enum Constants

- XR_META_ENVIRONMENT_RAYCAST_EXTENSION_NAME
- XR_META_environment_raycast_SPEC_VERSION
- Extending XrObjectType:
  - XR_OBJECT_TYPE_ENVIRONMENT_RAYCASTER_META
- Extending XrStructureType:
  - XR_TYPE_ENVIRONMENT_RAYCASTER_CREATE_COMPLETION_META
  - XR_TYPE_ENVIRONMENT_RAYCASTER_CREATE_INFO_META
  - XR_TYPE_ENVIRONMENT_RAYCAST_FILTER_DISTANCE_META
  - XR_TYPE_ENVIRONMENT_RAYCAST_HIT_GET_INFO_META
  - XR_TYPE_ENVIRONMENT_RAYCAST_HIT_META
  - XR_TYPE_SYSTEM_ENVIRONMENT_RAYCAST_PROPERTIES_META

12.151.1. Overview

Visemes are the visual representations of the face and mouth while speaking certain sounds in a spoken language. Visemes are used here as an alternative way of representing the output of the face tracking extension.

This extension augments the XR_FB_face_tracking2 extension to enable an alternative way of representing its output.

The application **must** also enable the XR_FB_face_tracking2 extension in order to use this extension.

12.151.2. Inspect system capability

The XrSystemFaceTrackingVisemesPropertiesMETA structure is defined as:

```
// Provided by XR_META_face_tracking_visemes
typedef struct XrSystemFaceTrackingVisemesPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsVisemes;
} XrSystemFaceTrackingVisemesPropertiesMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- supportsVisemes is an XrBool32 specifying if visemes are supported.

An application **can** inspect whether the system is capable of estimating visemes by extending the XrSystemProperties with XrSystemFaceTrackingVisemesPropertiesMETA structure when calling xrGetSystemProperties.

The runtime **must** set `supportsVisemes` to `XR_FALSE`, if both XrSystemFaceTrackingProperties2FB ::`supportsVisualFaceTracking` and XrSystemFaceTrackingProperties2FB::`supportsAudioFaceTracking` of XrSystemFaceTrackingProperties2FB are `XR_FALSE`.

Valid Usage (Implicit)

- The `XR_META_face_tracking_visemes` extension **must** be enabled prior to using XrSystemFaceTrackingVisemesPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_FACE_TRACKING_VISEMES_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.151.3. Obtain visemes

The XrFaceTrackingVisemesMETA structure is defined as:

```
// Provided by XR_META_face_tracking_visemes
typedef struct XrFaceTrackingVisemesMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           isValid;
    float              visemes[XR_FACE_TRACKING_VISEME_COUNT_META];
} XrFaceTrackingVisemesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `isValid` is an `XrBool32` which indicates that the visemes are valid.
- `visemes` is an array of `float` that will be filled with visemes.

The XrFaceTrackingVisemesMETA structure returns the visemes. The application **can** add XrFaceTrackingVisemesMETA to the `next` chain of the XrFaceExpressionWeights2FB structure when calling xrGetFaceExpressionWeights2FB.

The runtime **should** set `isValid` to `XR_FALSE`, if any of the following are true:

- the face tracker failed to estimate visemes

- the application lost focus
- the consent for audio recording was denied.

If `isValid` is `XR_FALSE`, the runtime **must** also set all elements of `visemes` to zero.

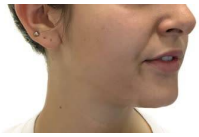
Otherwise, if the runtime sets `isValid` to `XR_TRUE`, the runtime **must** update the `visemes` array ordered so that the array elements are indexed using the corresponding viseme enumeration XrFaceTrackingVisemeMETA.

Each value in the `visemes` array **must** be between 0.0 and 1.0 (inclusive), and the values represent a probability. If `isValid` is `XR_TRUE`, the summation of all elements in the `visemes` array **must** be 1.0.

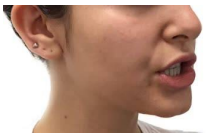
If the application only wants visemes without blend shapes, as a **change** in the behavior of the underlying extension, it **may** assign 0 to XrFaceExpressionWeights2FB::`weightCount` and XrFaceExpressionWeights2FB::`confidenceCount` when calling xrGetFaceExpressionWeights2FB. In this case, the application **can** assign `NULL` to XrFaceExpressionWeights2FB::`weights` and XrFaceExpressionWeights2FB::`confidences`.

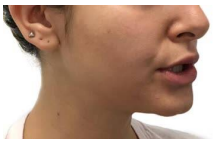
Valid Usage (Implicit)

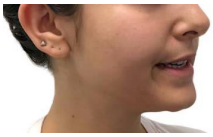
- The `XR_META_face_tracking_visemes` extension **must** be enabled prior to using XrFaceTrackingVisemesMETA
- `type` **must** be `XR_TYPE_FACE_TRACKING_VISEMES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

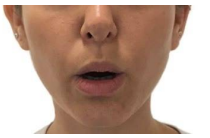


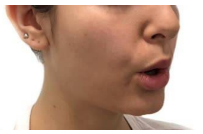
12.151.4. Conventions of visemes











This extension defines 15 visemes and is designed to match existing 15-viseme standards as well as match the older Oculus Lipsync API's visemes.

```
#define XR_FACE_TRACKING_VISEME_COUNT_META 15
```

They are enumerated by XrFaceTrackingVisemeMETA.

```
// Provided by XR_META_face_tracking_visemes
typedef enum XrFaceTrackingVisemeMETA {
    XR_FACE_TRACKING_VISEME_SIL_META = 0,
    XR_FACE_TRACKING_VISEME_PP_META = 1,
    XR_FACE_TRACKING_VISEME_FF_META = 2,
    XR_FACE_TRACKING_VISEME_TH_META = 3,
    XR_FACE_TRACKING_VISEME_DD_META = 4,
    XR_FACE_TRACKING_VISEME_KK_META = 5,
    XR_FACE_TRACKING_VISEME_CH_META = 6,
    XR_FACE_TRACKING_VISEME_SS_META = 7,
    XR_FACE_TRACKING_VISEME_NN_META = 8,
    XR_FACE_TRACKING_VISEME_RR_META = 9,
    XR_FACE_TRACKING_VISEME_AA_META = 10,
    XR_FACE_TRACKING_VISEME_E_META = 11,
    XR_FACE_TRACKING_VISEME_IH_META = 12,
    XR_FACE_TRACKING_VISEME_OH_META = 13,
    XR_FACE_TRACKING_VISEME_OU_META = 14,
    XR_FACE_TRACKING_VISEME_MAX_ENUM_META = 0x7FFFFFFF
} XrFaceTrackingVisemeMETA;
```

Viseme	Phonemes	Examples	Mild Production	Emphasized Production	Rotated Image
SIL (XR_FACE_TRACKING_VISEME_SIL_META)	neutral			None

12.151.5. Example code for obtaining visemes

The following example code demonstrates how to obtain all visemes.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// Confirm face tracking system support.
XrSystemFaceTrackingVisemesPropertiesMETA faceTrackingVisemesSystemProperties{
    .type = XR_TYPE_SYSTEM_FACE_TRACKING_VISEMES_PROPERTIES_META,
};
XrSystemProperties systemProperties{
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &faceTrackingVisemesSystemProperties,

    }
}
```

12.151.6. New Structures

- Extending XrFaceExpressionWeights2FB:
  - XrFaceTrackingVisemesMETA
- Extending XrSystemProperties:
  - XrSystemFaceTrackingVisemesPropertiesMETA

12.151.7. New Enums

- XrFaceTrackingVisemeMETA

12.151.8. New Enum Constants

- XR_FACE_TRACKING_VISEME_COUNT_META
- XR_META_FACE_TRACKING_VISEMES_EXTENSION_NAME
- XR_META_face_tracking_visemes_SPEC_VERSION
- Extending XrStructureType:
  - XR_TYPE_FACE_TRACKING_VISEMES_META
  - XR_TYPE_SYSTEM_FACE_TRACKING_VISEMES_PROPERTIES_META

12.151.9. Issues

- Does this extension operate independently of XR_FB_face_tracking2?
  - Resolved.
  - Answer: Yes. The extension allows the application to query visemes data without returning blend weights (from XR_FB_face_tracking2) but it is expected that an application could use the two datasets together and that a runtime could generate the two datasets together.

12.151.10. Version History

Overview

Eye tracked foveated rendering renders lower pixel density in the periphery of the user's gaze, taking advantage of low peripheral acuity.

This extension allows:

- An application to query eye tracked foveation availability.
- An application to request eye tracked foveation profile supported by the runtime and apply them to foveation-supported swapchains.
- An application to query foveation center position every frame.
- An application to request a foveation pattern update from the runtime. As a consequence, runtime knows how to adjust the eye tracking camera exposure start time in order to optimize the total pipeline latency.

New Object Types

New Flag Types

```
// Provided by XR_META_foveation_eye_tracked
typedef XrFlags64 XrFoveationEyeTrackedProfileCreateFlagsMETA;
```

```
// Provided by XR_META_foveation_eye_tracked
// Flag bits for XrFoveationEyeTrackedProfileCreateFlagsMETA
```

There are currently no eye tracked profile create flags. This is reserved for future use.

```
// Provided by XR_META_foveation_eye_tracked
typedef XrFlags64 XrFoveationEyeTrackedStateFlagsMETA;
```

```
// Provided by XR_META_foveation_eye_tracked
// Flag bits for XrFoveationEyeTrackedStateFlagsMETA
static const XrFoveationEyeTrackedStateFlagsMETA
XR_FOVEATION_EYE_TRACKED_STATE_VALID_BIT_META = 0x00000001;
```

Flag Descriptions

- XR_FOVEATION_EYE_TRACKED_STATE_VALID_BIT_META — Indicates whether or not foveation data is valid. This can happen if the eye tracker is obscured, the camera has dirt, or eye lid is closed, etc.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_FOVEATION_EYE_TRACKED_PROFILE_CREATE_INFO_META
- XR_TYPE_FOVEATION_EYE_TRACKED_STATE_META
- XR_TYPE_SYSTEM_FOVEATION_EYE_TRACKED_PROPERTIES_META

New Enums

New Structures

The XrFoveationEyeTrackedProfileCreateInfoMETA structure is defined as:

```
// Provided by XR_META_foveation_eye_tracked
typedef struct XrFoveationEyeTrackedProfileCreateInfoMETA {
    XrStructureType                                 type;
    const void*                                     next;
    XrFoveationEyeTrackedProfileCreateFlagsMETA    flags;
} XrFoveationEyeTrackedProfileCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrFoveationEyeTrackedProfileCreateFlagBitsMETA which indicate various characteristics for how eye tracked foveation is enabled on the swapchain.

XrFoveationEyeTrackedProfileCreateInfoMETA **can** be added to the `next` chain of XrFoveationLevelProfileCreateInfoFB in order to enable eye tracked foveation. The runtime **must** apply an eye tracked foveation pattern according to the parameters defined in the XrFoveationLevelProfileCreateInfoFB.

Valid Usage (Implicit)

- The `XR_META_foveation_eye_tracked` extension **must** be enabled prior to using XrFoveationEyeTrackedProfileCreateInfoMETA
- `type` **must** be `XR_TYPE_FOVEATION_EYE_TRACKED_PROFILE_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0`

The XrFoveationEyeTrackedStateMETA structure is defined as:

```
// Provided by XR_META_foveation_eye_tracked
typedef struct XrFoveationEyeTrackedStateMETA {
    XrStructureType                         type;
    void*                                   next;
    XrVector2f                              foveationCenter[
XR_FOVEATION_CENTER_SIZE_META];
    XrFoveationEyeTrackedStateFlagsMETA     flags;
} XrFoveationEyeTrackedStateMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `foveationCenter` is the center of the foveal region defined in NDC space in the range of -1 to 1 for both eyes.
- `flags` is a bitmask of XrFoveationEyeTrackedStateFlagBitsMETA which indicates various characteristics for current foveation state.

XrFoveationEyeTrackedStateMETA **must** be provided when calling xrGetFoveationEyeTrackedStateMETA. The runtime **must** interpret XrFoveationEyeTrackedStateMETA without any additional structs in its `next` chain in order to query eye tracked foveation state, e.g. the center of the foveal region.

Valid Usage (Implicit)

- The `XR_META_foveation_eye_tracked` extension **must** be enabled prior to using XrFoveationEyeTrackedStateMETA
- `type` **must** be `XR_TYPE_FOVEATION_EYE_TRACKED_STATE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSystemFoveationEyeTrackedPropertiesMETA structure is defined as:

```
// Provided by XR_META_foveation_eye_tracked
typedef struct XrSystemFoveationEyeTrackedPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsFoveationEyeTracked;
} XrSystemFoveationEyeTrackedPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `supportsFoveationEyeTracked` indicates if the current system is capable of eye tracked foveation.

An application **can** inspect whether the system is capable of eye tracked foveation by extending the XrSystemProperties with XrSystemFoveationEyeTrackedPropertiesMETA structure when calling xrGetSystemProperties.

Valid Usage (Implicit)

- The `XR_META_foveation_eye_tracked` extension **must** be enabled prior to using XrSystemFoveationEyeTrackedPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_FOVEATION_EYE_TRACKED_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrGetFoveationEyeTrackedStateMETA function is defined as:

```
// Provided by XR_META_foveation_eye_tracked
XrResult xrGetFoveationEyeTrackedStateMETA(
    XrSession                                   session,
    XrFoveationEyeTrackedStateMETA*             foveationState);
```

Parameter Descriptions

- `session` is the XrSession in which the eye tracked foveation profile is applied.
- `foveationState` is a pointer to an XrFoveationEyeTrackedStateMETA structure returning the current eye tracked foveation state.

The xrGetFoveationEyeTrackedStateMETA function returns the current eye tracked foveation state including the center of the foveal region, validity of the foveation data, etc.

Note that xrUpdateSwapchainFB **should** be called right before the xrGetFoveationEyeTrackedStateMETA function in order to (1) request a foveation pattern update by the runtime (2) optionally instruct the runtime to adjust the eye tracking camera capture start time in order to optimize for pipeline latency.

Valid Usage (Implicit)

- The `XR_META_foveation_eye_tracked` extension **must** be enabled prior to calling xrGetFoveationEyeTrackedStateMETA
- `session` **must** be a valid XrSession handle
- `foveationState` **must** be a pointer to an XrFoveationEyeTrackedStateMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

12.153.1. Overview

This extension augments the XR_EXT_hand_tracking extension. If the application passes XR_META_hand_tracking_frequency_hint but does not pass XR_EXT_hand_tracking then xrCreateInstance **must** return XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED.

This extension allows applications to provide a frequency hint to the runtime to indicate the desired hand tracking update frequency. Applications **can** suggest that the runtime use a higher tracking frequency when needed for low-latency scenarios, or use the default frequency for normal operation.

12.153.2. Setting the hand tracking frequency hint

The xrSetHandTrackingFrequencyHintMETA function provides a frequency hint to the runtime to suggest the desired hand tracking update frequency for the session.

```
// Provided by XR_META_hand_tracking_frequency_hint
XrResult xrSetHandTrackingFrequencyHintMETA(
    XrSession                                   session,
    XrHandTrackingFrequencyHintMETA             frequencyHint);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `frequencyHint` is the frequency hint that the application suggests to the runtime.

xrSetHandTrackingFrequencyHintMETA provides a frequency hint to the runtime to suggest the desired hand tracking update frequency for the session. This is a suggestion mechanism only, and the runtime **may** choose to ignore the hint based on user preferences, system constraints, power management policies, or other considerations. Applications **should** not rely on the runtime honoring the frequency hint and **should** be prepared to handle hand tracking data at any supported frequency.

The frequency hint remains active until changed by another call to xrSetHandTrackingFrequencyHintMETA or until the session is destroyed.

Applications **can** call this function multiple times during a session to adjust the frequency hint based on changing application requirements.

The runtime **may** change the actual hand tracking frequency at any time, regardless of the frequency hint, and applications **should** be prepared to handle hand tracking data at any supported frequency.

Valid Usage (Implicit)

- The `XR_META_hand_tracking_frequency_hint` extension **must** be enabled prior to calling xrSetHandTrackingFrequencyHintMETA
- `session` **must** be a valid XrSession handle
- `frequencyHint` **must** be a valid XrHandTrackingFrequencyHintMETA value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.153.3. Hand Tracking Frequency Hint

The XrHandTrackingFrequencyHintMETA enumerates the frequency hints that applications **can** provide to suggest the desired hand tracking update frequency to the runtime.

```
// Provided by XR_META_hand_tracking_frequency_hint
typedef enum XrHandTrackingFrequencyHintMETA {
    XR_HAND_TRACKING_FREQUENCY_HINT_DEFAULT_META = 1,
    XR_HAND_TRACKING_FREQUENCY_HINT_HIGH_META = 2,
    XR_HAND_TRACKING_FREQUENCY_HINT_MAX_ENUM_META = 0x7FFFFFFF
} XrHandTrackingFrequencyHintMETA;
```

Enumerant Descriptions

- XR_HAND_TRACKING_FREQUENCY_HINT_DEFAULT_META - This value indicates that the application suggests the runtime use the default hand tracking frequency. This is typically the most power-efficient frequency that provides adequate tracking quality for general use cases.
- XR_HAND_TRACKING_FREQUENCY_HINT_HIGH_META - This value indicates that the application suggests the runtime use a higher hand tracking frequency when possible. This **may** provide more responsive tracking for performance-critical applications, but at higher framerates, the effectiveness of temporal smoothing algorithms is reduced, which **can** result in increased jitter and less visually smooth hand tracking.

12.153.4. Sample code

```
XrSession session; // previously initialized
PFN_xrSetHandTrackingFrequencyHintMETA setHandTrackingFrequencyHint; // previously
initialized

/// request the default hand tracking frequency
CHK_XR(setHandTrackingFrequencyHint(session,
XR_HAND_TRACKING_FREQUENCY_HINT_DEFAULT_META));

/// request a high hand tracking frequency
CHK_XR(setHandTrackingFrequencyHint(session, XR_HAND_TRACKING_FREQUENCY_HINT_HIGH_META));
```

12.153.5. Issues

1) Should the frequency hint be per-handTracker or per-session?

RESOLVED: Per-session. Most applications that require high-frequency hand tracking will need it for both hands simultaneously. A per-session approach simplifies the API and reduces the complexity for both applications and runtimes.

2) Should there be more granular frequency levels beyond DEFAULT and HIGH?

RESOLVED: No. A simple two-level hint system provides sufficient flexibility for most use cases while keeping the API simple. More granular control could be added in future extensions if needed.

12.154.1. Overview

Microgestures expand the capabilities of hand tracking by enabling low-calorie thumb tap and swipe motions to trigger discrete D-pad-like directional commands.

The hand pose and motion of the thumb is as follows: initially, the user **must** raise their thumb above their index finger (not touching the index finger). For best results, the user **should** slightly curl the other fingers as in the following illustration; i.e. not too extended, nor completely curled into a fist.

A **tap** is performed by touching the middle segment of the index finger with the thumb, and then lifting the thumb.

The four directional thumb swipes performed on the surface of the index finger are:

Left swipe

a swipe towards the index fingertip on the right hand, and away from the index fingertip on the left

hand. On the right hand for example, the motion is as follows: the thumb starts raised above the index finger, touches the middle segment of the index finger, slides towards the index fingertip, and lifts.

Right swipe

the same motion as the left swipe, but in the opposite direction. On the right hand for example, the thumb starts raised above the index finger, touches the middle segment of the index finger, slides away from the index fingertip, and lifts.

Forward swipe

the thumb starts raised above the index finger, touches the middle segment of the index finger, slides forward, and lifts.

Backward swipe

the thumb starts raised above the index finger, touches the middle segment of the index finger, slides backward/downward, and lifts.

Note that the motions are performed at moderate to quick speeds, and are intended to be performed in one smooth motion. The detection of the gesture happens at the end of the motion, regardless of speed.

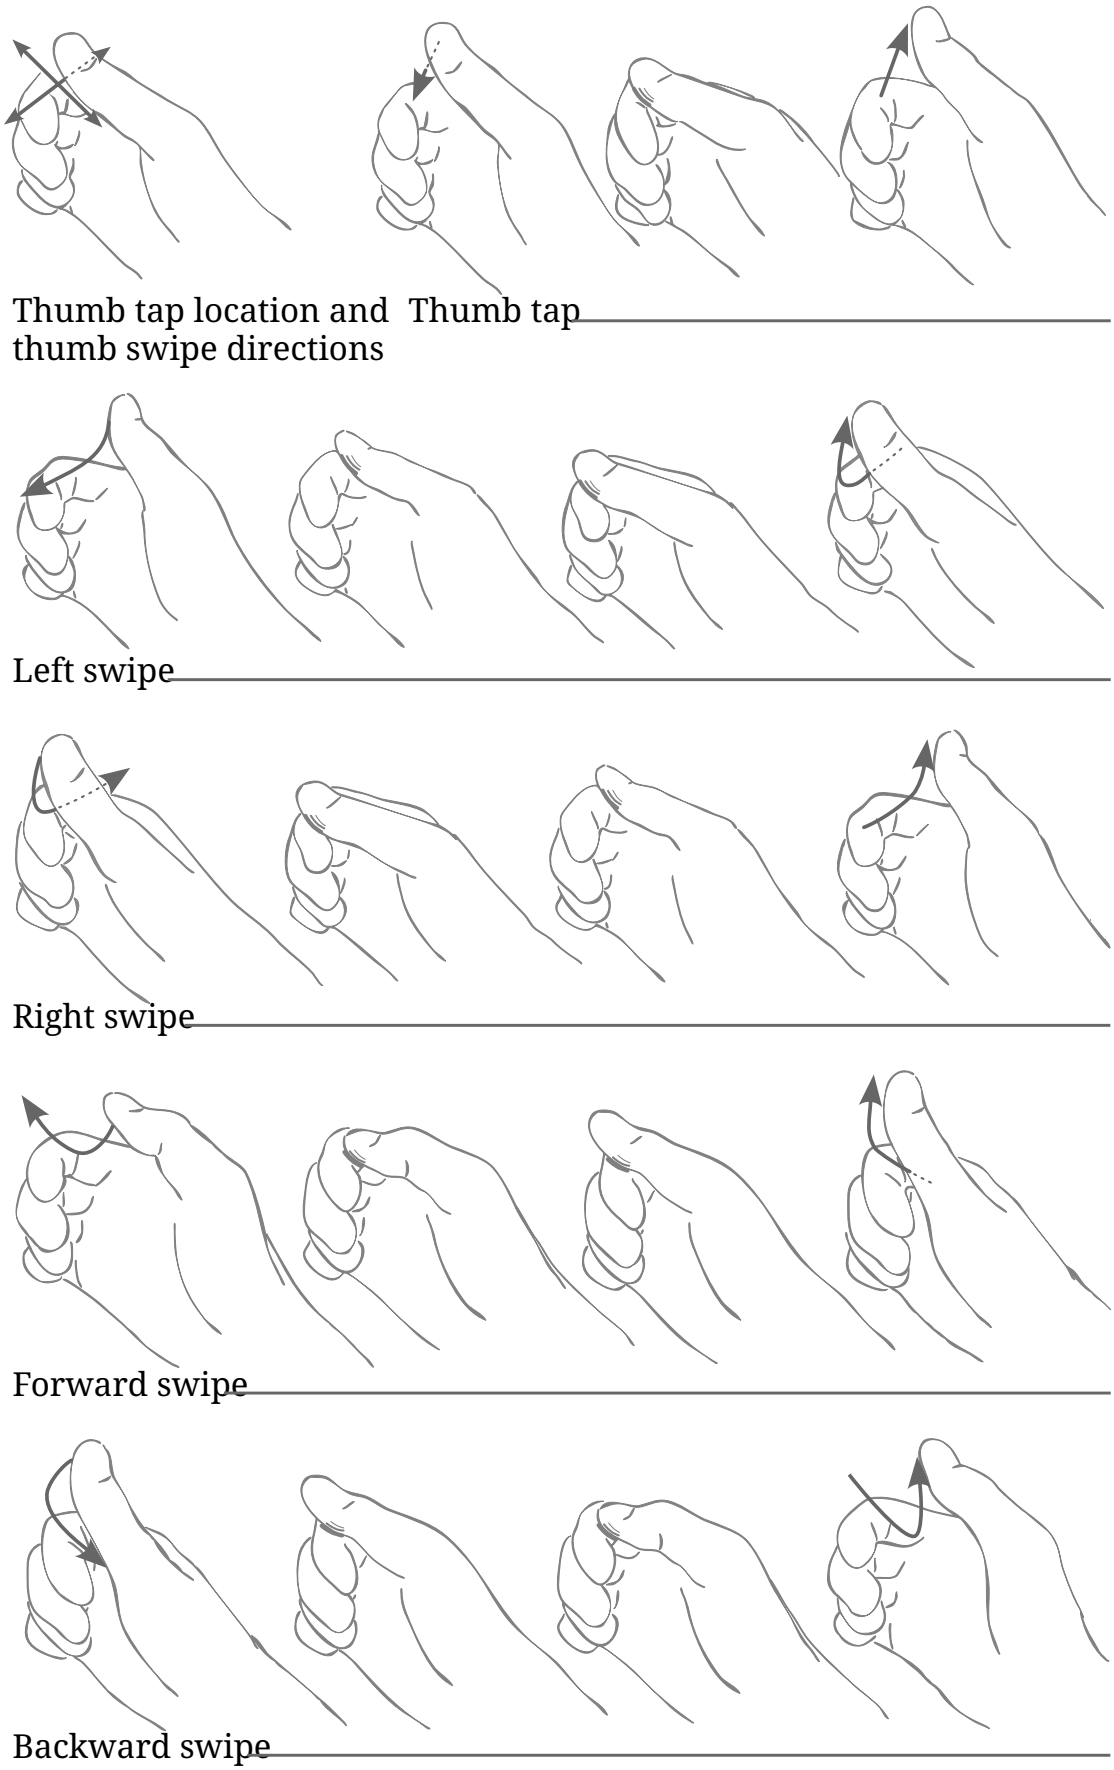

Figure 35. Microgestures

This extension exposes these discrete signals through the OpenXR action system. It augments XR_EXT_hand_interaction by adding a series of component paths to the interaction profile.

12.154.2. Enabling Microgestures

In order to use the binding paths defined in this extension in addition to those already present in XR_EXT_hand_interaction, applications **must** enable **both** XR_EXT_hand_interaction and XR_META_hand_tracking_microgestures.

If the application passes XR_META_hand_tracking_microgestures but does not pass XR_EXT_hand_interaction then xrCreateInstance **must** return XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED.

12.154.3. Action paths for Microgestures

Interaction profile path:

- */interaction_profiles/ext/hand_interaction_ext*

Valid for top level user path:

- */user/hand/left*
- */user/hand/right*

Additional supported component paths:

- *.../input/swipe_left_meta/click*
- *.../input/swipe_right_meta/click*
- *.../input/swipe_forward_meta/click*
- *.../input/swipe_backward_meta/click*
- *.../input/tap_thumb_meta/click*

All listed inputs are boolean that become XR_TRUE once the corresponding gesture has been completed and recognized.

Corresponding inputs are XR_FALSE otherwise, even during the progress of a gesture.

12.154.4. New Enum Constants

- XR_META_HAND_TRACKING_MICROGESTURES_EXTENSION_NAME
- XR_META_hand_tracking_microgestures_SPEC_VERSION

12.154.5. Issues

When the `XR_EXT_hand_interaction` and `XR_META_hand_tracking_microgestures` extensions are available and enabled, the runtime **should** avoid interferences between the detection of pinches and microgestures, gestures that are similar in nature. Specifically, a swipe towards the tip of the index finger **should** not be misclassified as a pinch.

12.155.1. Overview

This extension augments the XR_EXT_hand_tracking extension. If the application passes XR_META_hand_tracking_unextrapolated_poses but does not pass XR_EXT_hand_tracking then xrCreateInstance **must** return XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED.

This extension allows applications to request unextrapolated hand tracking poses and obtain information about the capture time of the data used to generate the hand poses. This is useful for applications that want to perform their own extrapolation using additional context information that is not available to the runtime.

When the application chains the XrHandTrackingUnextrapolatedPosesRequestMETA structure to the XrHandJointsLocateInfoEXT structure when calling xrLocateHandJointsEXT, the runtime **must** provide the latest calculated hand poses without temporal extrapolation. The time parameter in XrHandJointsLocateInfoEXT is still used for determining the reference space transformation, but **must** be ignored for determining the hand joint locations themselves.

The XrHandTrackingUnextrapolatedPosesRequestMETA structure **can** be used to request unextrapolated hand tracking poses.

```
// Provided by XR_META_hand_tracking_unextrapolated_poses
typedef struct XrHandTrackingUnextrapolatedPosesRequestMETA {
    XrStructureType    type;
    const void*        next;
} XrHandTrackingUnextrapolatedPosesRequestMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.

The XrHandTrackingUnextrapolatedPosesRequestMETA is a structure that an application **can** chain to XrHandJointsLocateInfoEXT::next when calling xrLocateHandJointsEXT to request that the runtime provide unextrapolated hand tracking poses.

Valid Usage (Implicit)

- The XR_META_hand_tracking_unextrapolated_poses extension **must** be enabled prior to using XrHandTrackingUnextrapolatedPosesRequestMETA
- type **must** be XR_TYPE_HAND_TRACKING_UNEXTRAPOLATED_POSES_REQUEST_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrHandTrackingUnextrapolatedPosesMETA is a structure that an application **can** chain to XrHandJointLocationsEXT::next when calling xrLocateHandJointsEXT to receive information about the unextrapolated hand tracking poses.

```
// Provided by XR_META_hand_tracking_unextrapolated_poses
typedef struct XrHandTrackingUnextrapolatedPosesMETA {
    XrStructureType    type;
    void*              next;
    XrTime             captureTime;
} XrHandTrackingUnextrapolatedPosesMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- captureTime is an XrTime representing when the data used to generate the returned hand poses were captured.

The runtime **must** populate this structure when the XrHandTrackingUnextrapolatedPosesRequestMETA structure is chained to the XrHandJointsLocateInfoEXT input structure. The runtime **must** not modify this structure if the XrHandTrackingUnextrapolatedPosesRequestMETA structure is not chained to the XrHandJointsLocateInfoEXT input structure.

The captureTime field indicates when the source data used to generate the hand poses were captured by the tracking system. This timestamp **can** be used by applications to understand the age of the tracking data and implement appropriate extrapolation or prediction algorithms. If there are no valid poses the captureTime **must** be zero.

Valid Usage (Implicit)

- The XR_META_hand_tracking_unextrapolated_poses extension **must** be enabled prior to using XrHandTrackingUnextrapolatedPosesMETA
- type **must** be XR_TYPE_HAND_TRACKING_UNEXTRAPOLATED_POSES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.155.2. Sample code

```
XrSession session; // previously initialized
XrSpace worldSpace; // previously initialized, e.g. from
  // XR_REFERENCE_SPACE_TYPE_LOCAL
XrFrameState frameState; // previously returned from xrWaitFrame
XrHandTrackerEXT handTracker; // previously initialized
PFN_xrLocateHandJointsEXT locateHandJoints; // previously initialized

/// unextrapolated poses request variable
XrHandTrackingUnextrapolatedPosesRequestMETA unextrapolatedPosesRequestMETA{
    .type = XR_TYPE_HAND_TRACKING_UNEXTRAPOLATED_POSES_REQUEST_META,
};

XrHandJointsLocateInfoEXT locateInfo{
    .type = XR_TYPE_HAND_JOINTS_LOCATE_INFO_EXT,
    .next = &unextrapolatedPosesRequestMETA,
    .baseSpace = worldSpace,
    .time = frameState.predictedDisplayTime,
};

/// unextrapolated poses response variable

    .type = XR_TYPE_HAND_TRACKING_UNEXTRAPOLATED_POSES_META,
};

XrHandJointLocationEXT jointLocations[XR_HAND_JOINT_COUNT_EXT];
XrHandJointLocationsEXT locations{
    .type = XR_TYPE_HAND_JOINT_LOCATIONS_EXT,
    .next = &unextrapolatedPosesMETA,
    .jointCount = XR_HAND_JOINT_COUNT_EXT,
    .jointLocations = jointLocations,
};

CHK_XR(locateHandJoints(handTracker, &locateInfo, &locations));

// jointLocations contains the unextrapolated hand poses
// unextrapolatedPosesMETA.captureTime the capture time of the hand poses
```

12.155.3. Issues

1) Should the extension validate that both request and response structures are chained together?

RESOLVED: No strict validation required. The runtime will populate the response structure when the request structure is present, but applications **may** choose to chain only the request structure if they do not need the capture time information.

12.156.1. Overview

This extension augments the `XR_EXT_hand_tracking_data_source` extension. If the application passes `XR_META_hand_tracking_wide_motion_mode2` but does not pass `XR_EXT_hand_tracking_data_source` then

xrCreateInstance **must** return XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED.

This extension adds a new data source value to XrHandTrackingDataSourceEXT, which applications **can** use to request hand tracking poses that utilize wide motion mode inference when hands are not directly visible to the tracking cameras. This data source represents inferred hand poses generated when the hands are outside the normal camera tracking volume. When active, the runtime employs inference algorithms to provide hand pose estimates based on previous tracking data, body motion, or other contextual information when the hands are not directly observable by the tracking system. Applications **can** use this data source both to request wide motion mode tracking and to query whether returned hand poses were generated using the wide motion inference system.

Enumerant Descriptions

- XR_HAND_TRACKING_DATA_SOURCE_UNOBSTRUCTED_WIDE_MOTION_META - This data source value indicates that the hand tracking system **should** use wide motion mode inference to provide hand poses when the hands are not directly visible to the tracking cameras. When this data source is active, the runtime is providing inferred hand poses based on contextual information such as previous tracking data, body motion, or other available sensors when hands are outside the normal tracking volume. Applications **can** use this data source value in XrHandTrackingDataSourceInfoEXT to request wide motion mode tracking, and **can** query XrHandTrackingDataSourceStateEXT to determine if returned poses were generated using the wide motion inference system. The quality and accuracy of poses returned via this data source **may** be reduced compared to direct optical tracking, particularly when hands have been out of view for extended periods.

12.156.2. Sample Code

```
XrSession session; // previously initialized
XrSpace worldSpace; // previously initialized, e.g. from
  // XR_REFERENCE_SPACE_TYPE_LOCAL
PFN_xrCreateHandTrackerEXT pfnCreateHandTracker; // previously initialized
PFN_xrLocateHandJointsEXT pfnLocateHandJoints; // previously initialized

/// create hand tracker that contains the unobstructed wide motion mode data source
XrHandTrackerEXT handTracker = XR_NULL_HANDLE;

XrHandTrackerCreateInfoEXT createInfo{
    .type = XR_TYPE_HAND_TRACKER_CREATE_INFO_EXT,
    .hand = XR_HAND_LEFT_EXT,
    .handJointSet = XR_HAND_JOINT_SET_DEFAULT_EXT,
};

std::array<XrHandTrackingDataSourceEXT, 2> dataSourcesWMM = {
    XR_HAND_TRACKING_DATA_SOURCE_UNOBSTRUCTED_EXT,
```

```
    XR_HAND_TRACKING_DATA_SOURCE_UNOBSTRUCTED_WIDE_MOTION_META,
};

XrHandTrackingDataSourceInfoEXT usageInfo{
    .type = XR_TYPE_HAND_TRACKING_DATA_SOURCE_INFO_EXT,
    .requestedDataSourceCount = static_cast<uint32_t>(dataSourcesWMM.size()),
    .requestedDataSources = dataSourcesWMM.data(),
};

createInfo.next = &usageInfo;
CHK_XR(pfnCreateHandTracker(session, &createInfo, &handTracker));

XrFrameState frameState; // previously returned from xrWaitFrame
const XrTime time = frameState.predictedDisplayTime;

/// locate hand tracker using the unobstructed wide motion mode data source
XrHandJointsLocateInfoEXT locateInfo{
    .type = XR_TYPE_HAND_JOINTS_LOCATE_INFO_EXT,
    .baseSpace = worldSpace,
    .time = time,
};

XrHandJointLocationEXT jointLocations[XR_HAND_JOINT_COUNT_EXT];
XrHandTrackingDataSourceStateEXT dataSourceState{
    .type = XR_TYPE_HAND_TRACKING_DATA_SOURCE_STATE_EXT,
};
XrHandJointLocationsEXT locations{
    .type = XR_TYPE_HAND_JOINT_LOCATIONS_EXT,
    .next = &dataSourceState,
    .jointCount = XR_HAND_JOINT_COUNT_EXT,
    .jointLocations = jointLocations,
};

CHK_XR(pfnLocateHandJoints(handTracker, &locateInfo, &locations));
if(dataSourceState.dataSource ==
XR_HAND_TRACKING_DATA_SOURCE_UNOBSTRUCTED_WIDE_MOTION_META){
    // the hand poses were generated using the wide motion mode inference system
}
```

Note

Using the headset ID to alter application behavior is discouraged, as it interferes with compatibility with current and future headsets. The OpenXR specification is designed with the goal of avoiding the need for explicit per-device logic. If the use of this extension is required, it is encouraged to let the OpenXR working group know about the use case, through a communication channel like email or GitHub. While this usage is discouraged, applications that need this functionality are encouraged to use this extension instead of the `systemName` field in XrSystemProperties. Game engines and similar middleware **should** not enable this extension by default. This extension will be deprecated and no longer exposed once the remaining use cases are resolved in a more portable way.

The XrSystemHeadsetIdPropertiesMETA structure is defined as:

```
// Provided by XR_META_headset_id
typedef struct XrSystemHeadsetIdPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrUuidEXT          id;
} XrSystemHeadsetIdPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `id` is the XrUuidEXT corresponding to the headset model.

An application **can** get a corresponding headset UUID of the headset model by chaining an XrSystemHeadsetIdPropertiesMETA structure to the XrSystemProperties when calling xrGetSystemProperties.

The UUID returned in the XrSystemHeadsetIdPropertiesMETA structure is an opaque UUID that identifies a runtime / headset model combo.

The runtime **should** always return the same UUID for a given headset model for the entire lifetime of that product.

The runtime **may** report a different UUID to some applications for compatibility purposes.

This is in contrast to the XrSystemProperties::`systemName` field which is not required to be consistent across product renames.

This is intended to be a temporary feature that will be deprecated along with its extension as soon as motivating use cases are resolved in a better way. See the disclaimer at the start of the XR_META_headset_id extension documentation for more details.

Valid Usage (Implicit)

- The XR_META_headset_id extension **must** be enabled prior to using XrSystemHeadsetIdPropertiesMETA
- type **must** be XR_TYPE_SYSTEM_HEADSET_ID_PROPERTIES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

Overview

Local dimming allows to adjust backlight intensity of dark areas on the screen in order to increase content dynamic range. Local dimming feature is not intended for optical see-through HMDs.

An application **can** request the local dimming mode on a frame basis by chaining an XrLocalDimmingFrameEndInfoMETA structure to the XrFrameEndInfo.

- Using XrFrameEndInfoLocalDimmingFB is considered as a hint and will not trigger xrEndFrame errors whether or not the requested dimming mode is fulfilled by the runtime.
- The runtime will have full control of the local dimming mode and **may** disregard app requests. For example, the runtime **may** allow only one primary client to control the local dimming mode.

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_LOCAL_DIMMING_FRAME_END_INFO_META

New Enums

The local dimming mode is specified by the XrLocalDimmingModeMETA enumeration:

```
// Provided by XR_META_local_dimming
typedef enum XrLocalDimmingModeMETA {
    XR_LOCAL_DIMMING_MODE_OFF_META = 0,
    XR_LOCAL_DIMMING_MODE_ON_META = 1,
    XR_LOCAL_DIMMING_MODE_MAX_ENUM_META = 0x7FFFFFFF
} XrLocalDimmingModeMETA;
```

Enumerant Descriptions

- XR_LOCAL_DIMMING_MODE_OFF_META — Local dimming is turned off by default for the current submitted frame. This is the same as not chaining XrLocalDimmingModeMETA.
- XR_LOCAL_DIMMING_MODE_ON_META — Local dimming is turned on for the current submitted frame.

New Structures

The XrLocalDimmingFrameEndInfoMETA structure is defined as:

```
// Provided by XR_META_local_dimming
typedef struct XrLocalDimmingFrameEndInfoMETA {
    XrStructureType           type;
    const void*               next;
    XrLocalDimmingModeMETA    localDimmingMode;
} XrLocalDimmingFrameEndInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- localDimmingMode is the local dimming mode for current submitted frame.

The XrLocalDimmingFrameEndInfoMETA is a structure that an application **can** chain in

XrFrameEndInfo in order to request a local dimming mode.

Valid Usage (Implicit)

- The XR_META_local_dimming extension **must** be enabled prior to using XrLocalDimmingFrameEndInfoMETA
- type **must** be XR_TYPE_LOCAL_DIMMING_FRAME_END_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- localDimmingMode **must** be a valid XrLocalDimmingModeMETA value

Overview

This extension adds the capability to define and apply RGB to RGB(A) color look-up tables (LUTs) to passthrough layers created using XR_FB_passthrough.

Color LUTs are 3-dimensional arrays which map each input color to a different output color. When applied to a Passthrough layer, the runtime **must** transform Passthrough camera images according to this map before display. Color LUTs **may** be used to achieve effects such as color grading, level control, color filtering, or chroma keying.

Color LUTs **must** be created using xrCreatePassthroughColorLutMETA before they **can** be applied to a Passthrough layer in a call to xrPassthroughLayerSetStyleFB (as a part of XrPassthroughColorMapLutMETA or XrPassthroughColorMapInterpolatedLutMETA). A color LUT **may** be applied to multiple Passthrough layers simultaneously.

New Object Types

```
// Provided by XR_META_passthrough_color_lut
XR_DEFINE_HANDLE(XrPassthroughColorLutMETA)
```

XrPassthroughColorLutMETA represents the definition and data for a color LUT which **may** be applied to a passthrough layer using xrPassthroughLayerSetStyleFB.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_PASSTHROUGH_COLOR_LUT_PROPERTIES_META
- XR_TYPE_PASSTHROUGH_COLOR_LUT_CREATE_INFO_META
- XR_TYPE_PASSTHROUGH_COLOR_LUT_UPDATE_INFO_META
- XR_TYPE_PASSTHROUGH_COLOR_MAP_LUT_META
- XR_TYPE_PASSTHROUGH_COLOR_MAP_INTERPOLATED_LUT_META

New Enums

Specify the color channels contained in the color LUT.

```
// Provided by XR_META_passthrough_color_lut
typedef enum XrPassthroughColorLutChannelsMETA {
    XR_PASSTHROUGH_COLOR_LUT_CHANNELS_RGB_META = 1,
    XR_PASSTHROUGH_COLOR_LUT_CHANNELS_RGBA_META = 2,
    XR_PASSTHROUGH_COLOR_LUT_CHANNELS_MAX_ENUM_META = 0x7FFFFFFF
} XrPassthroughColorLutChannelsMETA;
```

New Structures

The XrSystemPassthroughColorLutPropertiesMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrSystemPassthroughColorLutPropertiesMETA {
    XrStructureType    type;
    const void*        next;
    uint32_t           maxColorLutResolution;
} XrSystemPassthroughColorLutPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `maxColorLutResolution` Maximum value for XrPassthroughColorLutCreateInfoMETA ::`resolution` supported by the system. Runtimes implementing this extension **must** support a value of at least 32 for this property.

When the `XR_META_passthrough_color_lut` extension is enabled, an application **may** pass in an XrSystemPassthroughColorLutPropertiesMETA structure in next chain structure when calling xrGetSystemProperties to acquire information about the connected system.

The runtime **must** populate the XrSystemPassthroughColorLutPropertiesMETA structure with the relevant information to the XrSystemProperties returned by the xrGetSystemProperties call.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrSystemPassthroughColorLutPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_PASSTHROUGH_COLOR_LUT_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrPassthroughColorLutDataMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrPassthroughColorLutDataMETA {
    uint32_t          bufferSize;
    const uint8_t*    buffer;
} XrPassthroughColorLutDataMETA;
```

Member Descriptions

- `bufferSize` is the number of bytes contained in the buffer data.
- `buffer` is a pointer to a memory block of `bufferSize` bytes that contains the LUT data.

XrPassthroughColorLutDataMETA defines the LUT data for a color LUT. This structure is used when creating and updating color LUTs.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrPassthroughColorLutDataMETA
- `buffer` **must** be a pointer to an array of `bufferSize` `uint8_t` values
- The `bufferSize` parameter **must** be greater than `0`

The XrPassthroughColorLutCreateInfoMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrPassthroughColorLutCreateInfoMETA {
    XrStructureType                     type;
    const void*                         next;
    XrPassthroughColorLutChannelsMETA   channels;
    uint32_t                            resolution;
    XrPassthroughColorLutDataMETA       data;
} XrPassthroughColorLutCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `channels` defines the color channels expected in one LUT element. The number of bytes expected per LUT element is 3 for `XR_PASSTHROUGH_COLOR_LUT_CHANNELS_RGB_META` and 4 for `XR_PASSTHROUGH_COLOR_LUT_CHANNELS_RGBA_META`.
- `resolution` is the number of LUT elements per input channel. The total number of elements in the LUT is $resolution^3$.
- `data` contains the data the LUT is initialized with.

`resolution` **must** be a power of 2, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`. The runtime **may** impose a limit on the maximum supported resolution, which is indicated in XrSystemPassthroughColorLutPropertiesMETA. If `resolution` exceeds that limit, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

`data` contains a 3-dimensional array which defines an output color for each RGB input color. The input color is scaled to be in the range [0, `resolution`]. For an RGBA LUT, the RGBA tuple of output colors for an input color (R_{in}, G_{in}, B_{in}) is found in the four bytes starting at the offset 4 * (R_{in} + G_{in} * `resolution` + B_{in} * $resolution^2$). For an RGB LUT, the RGB tuple of output colors for an input color (R_{in}, G_{in}, B_{in}) is found in the three bytes starting at the offset 3 * (R_{in} + G_{in} * `resolution` + B_{in} * $resolution^2$).

Color LUT data **must** be specified and interpreted in sRGB color space.

Runtimes **must** employ trilinear interpolation of neighboring color values if the resolution of the color LUT is smaller than the bit depth of the input colors.

The value of XrPassthroughColorLutDataMETA::`bufferSize` in `data` **must** be equal to $resolution^3$ * bytesPerElement, where bytesPerElement is either 3 or 4 depending on `channels`. Otherwise, the runtime **must** return `XR_ERROR_PASSTHROUGH_COLOR_LUT_BUFFER_SIZE_MISMATCH_META`.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrPassthroughColorLutCreateInfoMETA
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_LUT_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `channels` **must** be a valid XrPassthroughColorLutChannelsMETA value
- `data` **must** be a valid XrPassthroughColorLutDataMETA structure

The XrPassthroughColorLutUpdateInfoMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrPassthroughColorLutUpdateInfoMETA {
    XrStructureType                 type;
    const void*                     next;
    XrPassthroughColorLutDataMETA    data;
} XrPassthroughColorLutUpdateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `data` contains the updated LUT data.

The LUT data **may** be updated for an existing color LUT, while channels and resolution remain constant after creation. Hence, the value of XrPassthroughColorLutDataMETA::`bufferSize` in `data` **must** be equal to the buffer size specified at creation. Otherwise, the runtime **must** return `XR_ERROR_PASSTHROUGH_COLOR_LUT_BUFFER_SIZE_MISMATCH_META`.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrPassthroughColorLutUpdateInfoMETA
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_LUT_UPDATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `data` **must** be a valid XrPassthroughColorLutDataMETA structure

The XrPassthroughColorMapLutMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrPassthroughColorMapLutMETA {
    XrStructureType                 type;
    const void*                     next;
    XrPassthroughColorLutMETA    colorLut;
    float                           weight;
} XrPassthroughColorMapLutMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `colorLut` is an XrPassthroughColorLutMETA.
- `weight` is a factor in the range [0, 1] which defines the linear blend between the original and the mapped colors for the output color.

XrPassthroughColorMapLutMETA lets applications apply a color LUT to a passthrough layer. Other Passthrough style elements (such as edges) **must** not be affected by color LUTs.

Applications **may** use `weight` to efficiently blend between the original colors and the mapped colors. The blend is computed as (1 - `weight`) * C_{in} + `weight` * `colorLut` [C_{in}].

XrPassthroughColorMapLutMETA is provided in the `next` chain of XrPassthroughStyleFB when calling xrPassthroughLayerSetStyleFB. Subsequent calls to xrPassthroughLayerSetStyleFB with XrPassthroughColorMapLutMETA in the `next` chain update the color LUT for that layer. Subsequent calls to xrPassthroughLayerSetStyleFB without this XrPassthroughColorMapLutMETA (or XrPassthroughColorMapInterpolatedLutMETA) in the next chain disable color LUTs for that layer.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrPassthroughColorMapLutMETA
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_MAP_LUT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `colorLut` **must** be a valid XrPassthroughColorLutMETA handle

The XrPassthroughColorMapInterpolatedLutMETA structure is defined as:

```
// Provided by XR_META_passthrough_color_lut
typedef struct XrPassthroughColorMapInterpolatedLutMETA {
    XrStructureType             type;
    const void*                 next;
    XrPassthroughColorLutMETA   sourceColorLut;
    XrPassthroughColorLutMETA   targetColorLut;
    float                       weight;
} XrPassthroughColorMapInterpolatedLutMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `sourceColorLut` is the initial XrPassthroughColorLutMETA.
- `targetColorLut` is the final XrPassthroughColorLutMETA.
- `weight` is a factor in the range [0, 1] which defines the linear blend between the initial and the final color LUT.

XrPassthroughColorMapInterpolatedLutMETA lets applications apply the interpolation between two color LUTs to a passthrough layer. Applications **may** use this feature to smoothly transition between two color LUTs. Other Passthrough style elements (such as edges) **must** not be affected by color LUTs.

The blend between `sourceColorLut` and `targetColorLut` is computed as (1 - `weight`) * `sourceColorLut` [C_{in}] + `weight` * `targetColorLut` [C_{in}].

XrPassthroughColorMapInterpolatedLutMETA is provided in the `next` chain of XrPassthroughStyleFB when calling xrPassthroughLayerSetStyleFB. Subsequent calls to xrPassthroughLayerSetStyleFB with XrPassthroughColorMapInterpolatedLutMETA in the next chain update the color LUT for that layer. Subsequent calls to xrPassthroughLayerSetStyleFB without this XrPassthroughColorMapInterpolatedLutMETA (or XrPassthroughColorMapLutMETA) in the next chain disable color LUTs for that layer.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to using XrPassthroughColorMapInterpolatedLutMETA
- `type` **must** be `XR_TYPE_PASSTHROUGH_COLOR_MAP_INTERPOLATED_LUT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `sourceColorLut` **must** be a valid XrPassthroughColorLutMETA handle
- `targetColorLut` **must** be a valid XrPassthroughColorLutMETA handle
- Both of `sourceColorLut` and `targetColorLut` **must** have been created, allocated, or retrieved from the same XrPassthroughFB

New Functions

The xrCreatePassthroughColorLutMETA function is defined as:

```
// Provided by XR_META_passthrough_color_lut
XrResult xrCreatePassthroughColorLutMETA(
    XrPassthroughFB                                 passthrough,
    const XrPassthroughColorLutCreateInfoMETA*  createInfo,
    XrPassthroughColorLutMETA*                  colorLut);
```

Parameter Descriptions

- `passthrough` is the XrPassthroughFB this color LUT is created for.
- `createInfo` is the XrPassthroughColorLutCreateInfoMETA.
- `colorLut` is the resulting XrPassthroughColorLutMETA.

Creates a passthrough color LUT. The resulting XrPassthroughColorLutMETA **may** be referenced in XrPassthroughColorMapLutMETA and XrPassthroughColorMapInterpolatedLutMETA in subsequent calls to xrPassthroughLayerSetStyleFB.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to calling xrCreatePassthroughColorLutMETA
- `passthrough` **must** be a valid XrPassthroughFB handle
- `createInfo` **must** be a pointer to a valid XrPassthroughColorLutCreateInfoMETA structure
- `colorLut` **must** be a pointer to an XrPassthroughColorLutMETA handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_PASSTHROUGH_COLOR_LUT_BUFFER_SIZE_MISMATCH_META
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyPassthroughColorLutMETA function is defined as:

```
// Provided by XR_META_passthrough_color_lut
XrResult xrDestroyPassthroughColorLutMETA(
    XrPassthroughColorLutMETA                   colorLut);
```

Parameter Descriptions

- colorLut is the XrPassthroughColorLutMETA to be destroyed.

Destroys a passthrough color LUT. If the color LUT is still in use (i.e. if for at least one passthrough layer, xrPassthroughLayerSetStyleFB has last been called with an instance of XrPassthroughColorMapLutMETA or XrPassthroughColorMapInterpolatedLutMETA in the next chain that references this color LUT), the runtime **must** retain the color LUT data and continue applying it to the affected passthrough layer until a different style is applied.

Valid Usage (Implicit)

- The `XR_META_passthrough_color_lut` extension **must** be enabled prior to calling xrDestroyPassthroughColorLutMETA
- `colorLut` **must** be a valid XrPassthroughColorLutMETA handle

Thread Safety

- Access to `colorLut`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

The xrUpdatePassthroughColorLutMETA function is defined as:

```
// Provided by XR_META_passthrough_color_lut
XrResult xrUpdatePassthroughColorLutMETA(
    XrPassthroughColorLutMETA                   colorLut,
    const XrPassthroughColorLutUpdateInfoMETA*  updateInfo);
```

Parameter Descriptions

- `colorLut` is the XrPassthroughColorLutMETA to be updated.
- `updateInfo` is the XrPassthroughColorLutUpdateInfoMETA.

Updates the LUT data of a passthrough color LUT. The data type of the color LUT (resolution and channels) is immutable. The provided data in this call **must** therefore match the data type specified at creation time. Specifically, XrPassthroughColorLutDataMETA::`bufferSize` of the new data **must** be equal to the XrPassthroughColorLutDataMETA::`bufferSize` specified during creation. Otherwise, the

runtime **must** return XR_ERROR_VALIDATION_FAILURE.

The runtime **must** reflect changes to color LUT data on all Passthrough layers the color LUT is currently applied to.

Valid Usage (Implicit)

- The XR_META_passthrough_color_lut extension **must** be enabled prior to calling xrUpdatePassthroughColorLutMETA
- colorLut **must** be a valid XrPassthroughColorLutMETA handle
- updateInfo **must** be a pointer to a valid XrPassthroughColorLutUpdateInfoMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_PASSTHROUGH_COLOR_LUT_BUFFER_SIZE_MISMATCH_META
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.160.1. Overview

This extension defines an event that is emitted once a passthrough layer (created using XR_FB_passthrough) is resumed and ready for displaying after a resume command or when the passthrough layer was created with XR_PASSTHROUGH_IS_RUNNING_AT_CREATION_BIT_FB.

The functions xrPassthroughLayerResumeFB and xrCreatePassthroughLayerFB from XR_FB_passthrough are asynchronous without any guarantees on when their effect will be visible on the display. Runtimes **may** asynchronously perform operations which **may** take several frames to complete, such as turning on sensor hardware. Runtimes queue this event under the aforementioned conditions when this extension is requested during instance creation.

Unlike most extensions, to start receiving the event, an app only needs to enable this extension.

This extension depends on XR_FB_passthrough.

12.160.2. New Event

The XrEventDataPassthroughLayerResumedMETA structure is defined as:

```
// Provided by XR_META_passthrough_layer_resumed_event
typedef struct XrEventDataPassthroughLayerResumedMETA {
    XrStructureType         type;
    const void*             next;
    XrPassthroughLayerFB    layer;
} XrEventDataPassthroughLayerResumedMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `layer` is an XrPassthroughLayerFB for which the event has been triggered.

Runtimes **must** queue the event exactly once when first presenting passthrough after an app successfully calls one of the following:

- xrPassthroughLayerResumeFB
- xrCreatePassthroughLayerFB with flag `XR_PASSTHROUGH_IS_RUNNING_AT_CREATION_BIT_FB` set

The passthrough layer state is reset when the app calls xrPassthroughLayerPauseFB.

Runtimes **must** queue the event again, if xrPassthroughLayerPauseFB is followed by xrPassthroughLayerResumeFB. During the transition from paused to resumed state, the event is queued exactly once when passthrough has been presented for the first time. If the passthrough feature is not active during the transition, for example because it has been paused using xrPassthroughPauseFB, the event is queued when passthrough becomes active.

Valid Usage (Implicit)

- The `XR_META_passthrough_layer_resumed_event` extension **must** be enabled prior to using XrEventDataPassthroughLayerResumedMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_PASSTHROUGH_LAYER_RESUMED_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

This extension provides applications with access to system preferences concerning passthrough. For

more information on how applications can control the display of passthrough, see XR_FB_passthrough.

New Flag Types

```
// Provided by XR_META_passthrough_preferences
typedef XrFlags64 XrPassthroughPreferenceFlagsMETA;
```

```
// Provided by XR_META_passthrough_preferences
// Flag bits for XrPassthroughPreferenceFlagsMETA
static const XrPassthroughPreferenceFlagsMETA
XR_PASSTHROUGH_PREFERENCE_DEFAULT_TO_ACTIVE_BIT_META = 0x00000001;
```

Flag Descriptions

- XR_PASSTHROUGH_PREFERENCE_DEFAULT_TO_ACTIVE_BIT_META — Indicates that the runtime recommends apps to default to a mixed reality experience with passthrough (if supported).

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_PASSTHROUGH_PREFERENCES_META

New Structures

The XrPassthroughPreferencesMETA structure is defined as:

```
// Provided by XR_META_passthrough_preferences
typedef struct XrPassthroughPreferencesMETA {
    XrStructureType                    type;
    const void*                        next;
    XrPassthroughPreferenceFlagsMETA   flags;
} XrPassthroughPreferencesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `flags` is a bitmask of XrPassthroughPreferenceFlagBitsMETA describing boolean passthrough preferences.

The runtime **must** populate the XrPassthroughPreferencesMETA structure with the relevant information when the app calls xrGetPassthroughPreferencesMETA.

Presence of the bit flag `XR_PASSTHROUGH_PREFERENCE_DEFAULT_TO_ACTIVE_BIT_META` does not indicate a guarantee that applications **can** enable and use passthrough in practice. The runtime **may** impose restrictions on passthrough usage (e.g. based on hardware availability or permission models) independently of the state of this flag bit. Apps **should** test for this flag explicitly, as more flag bits **may** be introduced in the future.

Valid Usage (Implicit)

- The `XR_META_passthrough_preferences` extension **must** be enabled prior to using XrPassthroughPreferencesMETA
- `type` **must** be `XR_TYPE_PASSTHROUGH_PREFERENCES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrGetPassthroughPreferencesMETA function is defined as:

```
// Provided by XR_META_passthrough_preferences
XrResult xrGetPassthroughPreferencesMETA(
    XrSession                                   session,
    XrPassthroughPreferencesMETA*               preferences);
```

Parameter Descriptions

- `session` is the XrSession.
- `preferences` points to an instance of XrPassthroughPreferencesMETA structure, that will be filled with returned information

An application **can** call xrGetPassthroughPreferencesMETA to retrieve passthrough-related preferences from the system.

Valid Usage (Implicit)

- The `XR_META_passthrough_preferences` extension **must** be enabled prior to calling xrGetPassthroughPreferencesMETA
- `session` **must** be a valid XrSession handle
- `preferences` **must** be a pointer to an XrPassthroughPreferencesMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Overview

This extension provides APIs to enumerate and query performance metrics counters of the current XR device and XR application. Developers **can** perform performance analysis and do targeted optimization to the XR application using the performance metrics counters being collected. The application **should** not change its behavior based on the counter reads.

The performance metrics counters are organized into predefined `XrPath` values, under the root path */perfmetrics_meta.* An application **can** query the available counters through xrEnumeratePerformanceMetricsCounterPathsMETA. Here is a list of the performance metrics counter paths that **may** be provided on Meta devices:

- */perfmetrics_meta/app/cpu_frametime*
- */perfmetrics_meta/app/gpu_frametime*
- */perfmetrics_meta/app/motion_to_photon_latency*
- */perfmetrics_meta/compositor/cpu_frametime*
- */perfmetrics_meta/compositor/gpu_frametime*
- */perfmetrics_meta/compositor/dropped_frame_count*
- */perfmetrics_meta/compositor/spacewarp_mode*
- */perfmetrics_meta/device/cpu_utilization_average*
- */perfmetrics_meta/device/cpu_utilization_worst*
- */perfmetrics_meta/device/gpu_utilization*
- */perfmetrics_meta/device/cpu0_utilization* through */perfmetrics_meta/device/cpuX_utilization*

After a session is created, an application **can** use xrSetPerformanceMetricsStateMETA to enable the performance metrics system for that session. An application **can** use xrQueryPerformanceMetricsCounterMETA to query a performance metrics counter on a session that has the performance metrics system enabled, or use xrGetPerformanceMetricsStateMETA to query if the performance metrics system is enabled.

Note: the measurement intervals of individual performance metrics counters are defined by the OpenXR runtime. The application **must** not make assumptions or change its behavior at runtime by measuring them.

New Flag Types

```
// Provided by XR_META_performance_metrics
typedef XrFlags64 XrPerformanceMetricsCounterFlagsMETA;
```

```
// Provided by XR_META_performance_metrics
// Flag bits for XrPerformanceMetricsCounterFlagsMETA
static const XrPerformanceMetricsCounterFlagsMETA
XR_PERFORMANCE_METRICS_COUNTER_ANY_VALUE_VALID_BIT_META = 0x00000001;
static const XrPerformanceMetricsCounterFlagsMETA
XR_PERFORMANCE_METRICS_COUNTER_UINT_VALUE_VALID_BIT_META = 0x00000002;
static const XrPerformanceMetricsCounterFlagsMETA
XR_PERFORMANCE_METRICS_COUNTER_FLOAT_VALUE_VALID_BIT_META = 0x00000004;
```

Flag Descriptions

- XR_PERFORMANCE_METRICS_COUNTER_ANY_VALUE_VALID_BIT_META — Indicates any of the values in XrPerformanceMetricsCounterMETA is valid.
- XR_PERFORMANCE_METRICS_COUNTER_UINT_VALUE_VALID_BIT_META — Indicates the uintValue in XrPerformanceMetricsCounterMETA is valid.
- XR_PERFORMANCE_METRICS_COUNTER_FLOAT_VALUE_VALID_BIT_META — Indicates the floatValue in XrPerformanceMetricsCounterMETA is valid.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_PERFORMANCE_METRICS_STATE_META
- XR_TYPE_PERFORMANCE_METRICS_COUNTER_META

New Enums

```
// Provided by XR_META_performance_metrics
typedef enum XrPerformanceMetricsCounterUnitMETA {
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_GENERIC_META = 0,
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_PERCENTAGE_META = 1,
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_MILLISECONDS_META = 2,
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_BYTES_META = 3,
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_HERTZ_META = 4,
    XR_PERFORMANCE_METRICS_COUNTER_UNIT_MAX_ENUM_META = 0x7FFFFFFF
} XrPerformanceMetricsCounterUnitMETA;
```

Enum	Description
XR_PERFORMANCE_METRICS_COUNTER_UNIT_GENERIC_META	the performance counter unit is generic (unspecified).
XR_PERFORMANCE_METRICS_COUNTER_UNIT_PERCENTAGE_META	the performance counter unit is percentage (%).
XR_PERFORMANCE_METRICS_COUNTER_UNIT_MILLISECONDS_META	the performance counter unit is millisecond.
XR_PERFORMANCE_METRICS_COUNTER_UNIT_BYTES_META	the performance counter unit is byte.
XR_PERFORMANCE_METRICS_COUNTER_UNIT_HERTZ_META	the performance counter unit is hertz (Hz).

New Structures

The XrPerformanceMetricsStateMETA structure is defined as:

```
// Provided by XR_META_performance_metrics
typedef struct XrPerformanceMetricsStateMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           enabled;
} XrPerformanceMetricsStateMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- enabled is set to XR_TRUE to indicate the performance metrics system is enabled, XR_FALSE otherwise, when getting state. When setting state, set to XR_TRUE to enable the performance metrics system and XR_FALSE to disable it.

XrPerformanceMetricsStateMETA is provided as input when calling xrSetPerformanceMetricsStateMETA to enable or disable the performance metrics system. XrPerformanceMetricsStateMETA is populated as an output parameter when calling xrGetPerformanceMetricsStateMETA to query if the performance metrics system is enabled.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to using XrPerformanceMetricsStateMETA
- type **must** be XR_TYPE_PERFORMANCE_METRICS_STATE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrPerformanceMetricsCounterMETA structure is defined as:

```
// Provided by XR_META_performance_metrics
typedef struct XrPerformanceMetricsCounterMETA {
    XrStructureType                         type;
    const void*                             next;
    XrPerformanceMetricsCounterFlagsMETA    counterFlags;
    XrPerformanceMetricsCounterUnitMETA     counterUnit;
    uint32_t                                uintValue;
    float                                   floatValue;
} XrPerformanceMetricsCounterMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- counterFlags is a bitmask of XrPerformanceMetricsCounterFlagBitsMETA describing the validity of value members.
- counterUnit is a enum of XrPerformanceMetricsCounterUnitMETA describing the measurement unit.
- uintValue is the counter value in uint32_t format. It is valid if counterFlags contains XR_PERFORMANCE_METRICS_COUNTER_UINT_VALUE_VALID_BIT_META.
- floatValue is the counter value in float format. It is valid if counterFlags contains XR_PERFORMANCE_METRICS_COUNTER_FLOAT_VALUE_VALID_BIT_META.

XrPerformanceMetricsCounterMETA is populated by calling xrQueryPerformanceMetricsCounterMETA to query real-time performance metrics counter

information.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to using XrPerformanceMetricsCounterMETA
- type **must** be XR_TYPE_PERFORMANCE_METRICS_COUNTER_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- counterFlags **must** be 0 or a valid combination of XrPerformanceMetricsCounterFlagBitsMETA values
- counterUnit **must** be a valid XrPerformanceMetricsCounterUnitMETA value

New Functions

The xrEnumeratePerformanceMetricsCounterPathsMETA function enumerates all performance metrics counter paths that supported by the runtime, it is defined as:

```
// Provided by XR_META_performance_metrics
XrResult xrEnumeratePerformanceMetricsCounterPathsMETA(
    XrInstance                                  instance,
    uint32_t                                    counterPathCapacityInput,
    uint32_t*                                   counterPathCountOutput,
    XrPath*                                     counterPaths);
```

Parameter Descriptions

- instance is an XrInstance handle previously created with xrCreateInstance.
- counterPathCapacityInput is the capacity of the counterPaths array, or 0 to indicate a request to retrieve the required capacity.
- counterPathCountOutput is filled in by the runtime with the count of counterPaths written or the required capacity in the case that counterPathCapacityInput is insufficient.
- counterPaths is an array of XrPath filled in by the runtime which contains all the available performance metrics counters, but **can** be NULL if counterPathCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required counterPaths size.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to calling xrEnumeratePerformanceMetricsCounterPathsMETA
- instance **must** be a valid XrInstance handle
- counterPathCountOutput **must** be a pointer to a uint32_t value
- If counterPathCapacityInput is not 0, counterPaths **must** be a pointer to an array of counterPathCapacityInput XrPath values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrSetPerformanceMetricsStateMETA function is defined as:

```
// Provided by XR_META_performance_metrics
XrResult xrSetPerformanceMetricsStateMETA(
    XrSession                                   session,
    const XrPerformanceMetricsStateMETA*        state);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- state is a pointer to an XrPerformanceMetricsStateMETA structure.

The xrSetPerformanceMetricsStateMETA function enables or disables the performance metrics system.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to calling xrSetPerformanceMetricsStateMETA
- session **must** be a valid XrSession handle
- state **must** be a pointer to a valid XrPerformanceMetricsStateMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetPerformanceMetricsStateMETA function is defined as:

```
// Provided by XR_META_performance_metrics
XrResult xrGetPerformanceMetricsStateMETA(
    XrSession                                   session,
    XrPerformanceMetricsStateMETA*              state);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- state is a pointer to an XrPerformanceMetricsStateMETA structure.

The xrGetPerformanceMetricsStateMETA function gets the current state of the performance metrics system.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to calling xrGetPerformanceMetricsStateMETA
- session **must** be a valid XrSession handle
- state **must** be a pointer to an XrPerformanceMetricsStateMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrQueryPerformanceMetricsCounterMETA function is defined as:

```
// Provided by XR_META_performance_metrics
XrResult xrQueryPerformanceMetricsCounterMETA(
    XrSession                                   session,
    XrPath                                      counterPath,
    XrPerformanceMetricsCounterMETA*            counter);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- counterPath is a valid performance metrics counter path.
- counter is a pointer to an XrPerformanceMetricsCounterMETA structure.

The xrQueryPerformanceMetricsCounterMETA function queries a performance metrics counter.

The application **should** enable the performance metrics system (by calling xrSetPerformanceMetricsStateMETA) before querying metrics using xrQueryPerformanceMetricsCounterMETA. If the performance metrics system has not been enabled before calling xrQueryPerformanceMetricsCounterMETA, the runtime **must** return XR_ERROR_VALIDATION_FAILURE.

If counterPath is not in the list returned by xrEnumeratePerformanceMetricsCounterPathsMETA, the runtime must return XR_ERROR_PATH_UNSUPPORTED.

Valid Usage (Implicit)

- The XR_META_performance_metrics extension **must** be enabled prior to calling xrQueryPerformanceMetricsCounterMETA
- session **must** be a valid XrSession handle
- counter **must** be a pointer to an XrPerformanceMetricsCounterMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_PATH_INVALID
- XR_ERROR_PATH_UNSUPPORTED
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

Ben Cumings, Meta

Overview

The extension allows an application to request a recommended swapchain resolution from the runtime, in order to either allocate a swapchain of a more appropriate size, or to render into a smaller image rect according to the recommendation. For layers with multiple views such as XrCompositionLayerProjection, the application **may** scale the individual views to match the scaled swapchain resolution.

The runtime **may** use any factors to drive the recommendation it wishes to return to the application. Those include static properties such as screen resolution and HMD type, but also dynamic ones such as layer positioning and system-wide GPU utilization.

Application **may** also use this extension to allocate the swapchain by passing in a layer with a swapchain handle XR_NULL_HANDLE.

New Structures

The XrRecommendedLayerResolutionMETA structure is defined as:

```
// Provided by XR_META_recommended_layer_resolution
typedef struct XrRecommendedLayerResolutionMETA {
    XrStructureType    type;
    void*              next;
    XrExtent2Di        recommendedImageDimensions;
    XrBool32           isValid;
} XrRecommendedLayerResolutionMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `recommendedImageDimensions` is the XrExtent2Di recommended image dimensions of the layer.
- `isValid` is the `XrBool32` boolean returned by the runtime which indicates whether the runtime returned a valid recommendation or does not have any recommendations to make.

If the runtime does not wish to make a recommendation, `isValid` **must** be `XR_FALSE` and `recommendedImageDimensions` **must** be {0,0}.

Valid Usage (Implicit)

- The `XR_META_recommended_layer_resolution` extension **must** be enabled prior to using XrRecommendedLayerResolutionMETA
- `type` **must** be `XR_TYPE_RECOMMENDED_LAYER_RESOLUTION_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrRecommendedLayerResolutionGetInfoMETA structure is defined as:

```
// Provided by XR_META_recommended_layer_resolution
typedef struct XrRecommendedLayerResolutionGetInfoMETA {
    XrStructureType                         type;
    const void*                             next;
    const XrCompositionLayerBaseHeader*     layer;
    XrTime                                  predictedDisplayTime;
} XrRecommendedLayerResolutionGetInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `layer` is a pointer to a structure based on XrCompositionLayerBaseHeader, describing the layer for which the application wants a runtime-recommended swapchain resolution. Layers with multiple views **may** scale the views to match the scaled swapchain resolution.
- `predictedDisplayTime` is the `XrTime` that the application intends to submit the layer for.

If `predictedDisplayTime` is older than the predicted display time returned from most recent xrWaitFrame then, the runtime **must** return `XR_ERROR_TIME_INVALID`.

Valid Usage (Implicit)

- The `XR_META_recommended_layer_resolution` extension **must** be enabled prior to using XrRecommendedLayerResolutionGetInfoMETA
- `type` **must** be `XR_TYPE_RECOMMENDED_LAYER_RESOLUTION_GET_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `layer` **must** be a pointer to a valid XrCompositionLayerBaseHeader-based structure. See also: XrCompositionLayerCubeKHR, XrCompositionLayerCylinderKHR, XrCompositionLayerEquirect2KHR, XrCompositionLayerEquirectKHR, XrCompositionLayerPassthroughANDROID, XrCompositionLayerPassthroughFB, XrCompositionLayerPassthroughHTC, XrCompositionLayerProjection, XrCompositionLayerQuad

New Functions

The xrGetRecommendedLayerResolutionMETA function is defined as:

```
// Provided by XR_META_recommended_layer_resolution
XrResult xrGetRecommendedLayerResolutionMETA(
    XrSession                                   session,
    const XrRecommendedLayerResolutionGetInfoMETA* info,
    XrRecommendedLayerResolutionMETA*           resolution);
```

Parameter Descriptions

- `session` is the XrSession in which the recommendation is made.
- `info` is a pointer to an XrRecommendedLayerResolutionGetInfoMETA structure containing the details of the layer for which the application is requesting a recommendation.
- `resolution` is a pointer to an XrRecommendedLayerResolutionMETA that the runtime will populate.

The xrGetRecommendedLayerResolutionMETA function returns the recommendation that the runtime wishes to make to the application for the layer provided in the XrRecommendedLayerResolutionGetInfoMETA structure. Application **may** choose to reallocate their swapchain or scale view resolution accordingly. Applications rendering multiple views into the swapchain **may** scale individual views to match the recommended swapchain resolution.

The runtime **may** not wish to make any recommendation, in which case it **must** return an XrRecommendedLayerResolutionMETA::`isValid` value of `XR_FALSE`.

If the XrRecommendedLayerResolutionGetInfoMETA::`layer` attribute of the `info` argument of the function contains valid swapchain handles in all fields where required, the runtime **must** return a resolution recommendation which is less than or equal to the size of that swapchain, so that the application **may** render into an existing swapchain or swapchains without reallocation. As an exception to valid usage, an otherwise-valid structure passed as XrRecommendedLayerResolutionGetInfoMETA::`layer` **may** contain XR_NULL_HANDLE in place of valid XrSwapchain handle(s) for this function only, to obtain a recommended resolution resolution for the purpose of allocating a swapchain. If at least one otherwise-required XrSwapchain handle within XrRecommendedLayerResolutionGetInfoMETA::`layer` is XR_NULL_HANDLE, the runtime **must** interpret this as a request for recommended resolution without limitation to the allocated size of any existing swapchain.

If the runtime makes a recommendation, it **should** make a recommendation that is directly usable by the application to render its frames without creating adverse visual effects for the user.

Issues

1. Should this extension be leveraging events instead of being queried potentially every frame?

   RESOLVED: Yes.

   We want to provide the runtime the flexibility to smoothly transition the application from one resolution to another in a dynamic resolution usecase without any reallocation. To do so with an event system would send an event every frame which we preferred to avoid.

12.164.1. Overview

Some XR systems have the ability to track both hands and controllers simultaneously (commonly referred to as multimodal hands and controllers input), but this may consume additional power and system resources. This extension defines two new functions that applications **can** use to control when the simultaneous hands and controller tracking is activated.

12.164.2. Inspect System Capability

The XrSystemSimultaneousHandsAndControllersPropertiesMETA structure is defined as:

```
// Provided by XR_META_simultaneous_hands_and_controllers
typedef struct XrSystemSimultaneousHandsAndControllersPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSimultaneousHandsAndControllers;
} XrSystemSimultaneousHandsAndControllersPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsSimultaneousHandsAndControllers` is an `XrBool32`, indicating if current system is capable of simultaneous hands and controller tracking.

An application **can** inspect whether the system is capable of enabling simultaneous hands and controller tracking by extending the XrSystemProperties with XrSystemSimultaneousHandsAndControllersPropertiesMETA structure when calling xrGetSystemProperties.

If and only if a runtime returns `XR_FALSE` for `supportsSimultaneousHandsAndControllers`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrResumeSimultaneousHandsAndControllersTrackingMETA and xrPauseSimultaneousHandsAndControllersTrackingMETA.

Valid Usage (Implicit)

- The `XR_META_simultaneous_hands_and_controllers` extension **must** be enabled prior to using XrSystemSimultaneousHandsAndControllersPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_SIMULTANEOUS_HANDS_AND_CONTROLLERS_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.164.3. Enable Simultaneous Tracking

The xrResumeSimultaneousHandsAndControllersTrackingMETA function is defined as:

```
// Provided by XR_META_simultaneous_hands_and_controllers
XrResult xrResumeSimultaneousHandsAndControllersTrackingMETA(
    XrSession                                           session,
    const XrSimultaneousHandsAndControllersTrackingResumeInfoMETA* resumeInfo);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession
- `resumeInfo` is a pointer to an instance of the XrSimultaneousHandsAndControllersTrackingResumeInfoMETA structure containing parameters affecting how the simultaneous hands and controllers mode is enabled

An application **can** call xrResumeSimultaneousHandsAndControllersTrackingMETA to enable simultaneous hands and controller tracking.

Runtimes **must** initialize the simultaneous tracking feature in a paused state, so applications call the resume function for the simultaneous tracking to start.

If xrResumeSimultaneousHandsAndControllersTrackingMETA is called when the feature is already in a resumed state, the runtime **must** return `XR_SUCCESS`.

If a system supports detection of whether a controller is currently held by the user, the runtime **should** represent this transition by switching the active interaction profile in the relevant hand from the active controller interaction profile to an interaction profile representing hands if available.

For example, the returned interaction from xrGetCurrentInteractionProfile on */user/hand/left* might change from */interaction_profiles/facebook/touch_controller_pro* to */interaction_profiles/ext/hand_interaction_ext*, generating an `XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED` (XrEventDataInteractionProfileChanged) event, assuming that bindings were suggested for both of those interaction profiles on that path.

This would indicate that the user put down the controller and is no longer holding a controller in their left hand. Note that in this example, if the user is holding a controller in their right hand, xrGetCurrentInteractionProfile on */user/hand/right* still returns */interaction_profiles/facebook/touch_controller_pro*.

Also note that if the `XR_META_detached_controllers` extension is used alongside `XR_META_simultaneous_hands_and_controllers`, then when a controller leaves the hand, it **may** report that interaction profile as current for the corresponding */user/detached_controller_meta* path if bindings have been suggested for that path. See `XR_META_simultaneous_hands_and_controllers` for details.

When simultaneous tracking is resumed, runtimes **should** allow xrGetCurrentInteractionProfile to return different interaction profiles for different top level */user* paths (e.g. */user/hand/left* and

/user/hand/right). Note that this behavior is already allowed by the specification, even without this extension, but runtimes exposing this extension **may** choose to not expose different interaction profiles for different top level */user* paths unless it is enabled.

When a held controller transitions to an unheld state, the current interaction profile for the relevant top level path **must** change to an interaction profile representing hand tracking, if available.

Valid Usage (Implicit)

- The `XR_META_simultaneous_hands_and_controllers` extension **must** be enabled prior to calling xrResumeSimultaneousHandsAndControllersTrackingMETA
- `session` **must** be a valid XrSession handle
- `resumeInfo` **must** be a pointer to a valid XrSimultaneousHandsAndControllersTrackingResumeInfoMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSimultaneousHandsAndControllersTrackingResumeInfoMETA structure is defined as:

```
// Provided by XR_META_simultaneous_hands_and_controllers
typedef struct XrSimultaneousHandsAndControllersTrackingResumeInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrSimultaneousHandsAndControllersTrackingResumeInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

This structure only exists to point to future extension structures.

Valid Usage (Implicit)

- The `XR_META_simultaneous_hands_and_controllers` extension **must** be enabled prior to using XrSimultaneousHandsAndControllersTrackingResumeInfoMETA
- `type` **must** be `XR_TYPE_SIMULTANEOUS_HANDS_AND_CONTROLLERS_TRACKING_RESUME_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.164.4. Disable Simultaneous Tracking

The xrPauseSimultaneousHandsAndControllersTrackingMETA function is defined as:

```
// Provided by XR_META_simultaneous_hands_and_controllers
XrResult xrPauseSimultaneousHandsAndControllersTrackingMETA(
    XrSession                                   session,
    const XrSimultaneousHandsAndControllersTrackingPauseInfoMETA* pauseInfo);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession
- `pauseInfo` is a pointer to an instance of the XrSimultaneousHandsAndControllersTrackingPauseInfoMETA structure containing parameters affecting how the simultaneous hands and controllers mode is to be paused

An application **can** call xrPauseSimultaneousHandsAndControllersTrackingMETA to disable simultaneous hands and controller tracking.

If xrPauseSimultaneousHandsAndControllersTrackingMETA is called when the feature is not running, the runtime **must** return `XR_SUCCESS`.

Tracking systems consume system resources and it is desirable to be able to stop them when they are not in use; a strong motivation for this extension is that it provides the ability for clients to dynamically switch to a multiple tracking system operating mode only as needed, thus preserving

system resources and improving battery performance.

Valid Usage (Implicit)

- The XR_META_simultaneous_hands_and_controllers extension **must** be enabled prior to calling xrPauseSimultaneousHandsAndControllersTrackingMETA
- session **must** be a valid XrSession handle
- pauseInfo **must** be a pointer to a valid XrSimultaneousHandsAndControllersTrackingPauseInfoMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSimultaneousHandsAndControllersTrackingPauseInfoMETA structure is defined as:

```
// Provided by XR_META_simultaneous_hands_and_controllers
typedef struct XrSimultaneousHandsAndControllersTrackingPauseInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrSimultaneousHandsAndControllersTrackingPauseInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

This structure only exists to point to future extension structures.

Valid Usage (Implicit)

- The `XR_META_simultaneous_hands_and_controllers` extension **must** be enabled prior to using XrSimultaneousHandsAndControllersTrackingPauseInfoMETA
- `type` **must** be `XR_TYPE_SIMULTANEOUS_HANDS_AND_CONTROLLERS_TRACKING_PAUSE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.164.5. New Commands

- xrPauseSimultaneousHandsAndControllersTrackingMETA

12.165.1. Overview

The `XR_META_spatial_entity_discovery` extension supports spatial entity retrieval in larger areas. It offers entity filters like component and UUID filters. This allows for more efficient and targeted discovery of spatial entities.

Technical overview

This extension enables finding and loading persisted Spatial Entities which **can** then be tracked across different sessions and over time by applications.

If the XR_SPACE_COMPONENT_TYPE_STORABLE_FB component has been enabled on a space, and that space has previously been persisted, application developers **can** discover and then track this XrSpace entity. XR_META_spatial_entity_discovery is expected to be used alongside XR_META_spatial_entity_persistence for space persistence and storage management.

XR_META_spatial_entity_discovery is not expected to be used alongside XR_FB_spatial_entity_sharing, and applications should not try to retrieve shared Spatial Entities via XR_META_spatial_entity_discovery, and should instead use XR_FB_spatial_entity_query to retrieve shared Spatial Entities.

12.165.2. Inspect System Capability

The XrSystemSpaceDiscoveryPropertiesMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSystemSpaceDiscoveryPropertiesMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           supportsSpaceDiscovery;
} XrSystemSpaceDiscoveryPropertiesMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- supportsSpaceDiscovery is an XrBool32, indicating if current system supports space discovery.

An application **can** inspect whether the system is capable of supporting space discovery by extending the XrSystemProperties with XrSystemSpaceDiscoveryPropertiesMETA structure when calling xrGetSystemProperties.

If and only if a runtime returns XR_FALSE for supportsSpaceDiscovery, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from xrDiscoverSpacesMETA and xrRetrieveSpaceDiscoveryResultsMETA.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to using XrSystemSpaceDiscoveryPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_SPACE_DISCOVERY_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.165.3. Discover Spaces

The xrDiscoverSpacesMETA function is defined as:

```
// Provided by XR_META_spatial_entity_discovery
XrResult xrDiscoverSpacesMETA(
    XrSession                                   session,
    const XrSpaceDiscoveryInfoMETA*             info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the input struct XrSpaceDiscoveryInfoMETA for the Discovery operation.
- `requestId` is a pointer to an `XrAsyncRequestIdFB` value and is an output parameter. The variable it points to is populated with the ID of this asynchronous request.

The xrDiscoverSpacesMETA function discovers spaces that were persisted previously, and which comply with the filters passed in the XrSpaceDiscoveryInfoMETA `info` structure.

This operation is asynchronous.

If xrDiscoverSpacesMETA returns a XR_FAILED result, no discovery operation takes place and no events will be queued for this operation.

If the asynchronous operation is scheduled successfully, the runtime **must** return `XR_SUCCESS` and the asynchronous discovery operation will queue at least 1 event.

If Spatial Entities have been discovered and are ready for retrieval, the runtime **must** queue an XrEventDataSpaceDiscoveryResultsAvailableMETA event. The runtime **may** queue 0, 1, or more XrEventDataSpaceDiscoveryResultsAvailableMETA events depending on the Spatial Entities found.

If and only if the runtime returns `XR_SUCCESS`, the runtime **must** queue a single XrEventDataSpaceDiscoveryCompleteMETA event identified with a

XrEventDataSpaceDiscoveryCompleteMETA::`requestId` matching the `requestId` value output by this function, referred to as the "corresponding completion event." The XrEventDataSpaceDiscoveryCompleteMETA event is queued after all XrEventDataSpaceDiscoveryResultsAvailableMETA events for this operation have been queued.

Completion results are conveyed in the event XrEventDataSpaceDiscoveryCompleteMETA, while availability of output for xrRetrieveSpaceDiscoveryResultsMETA is signaled by either this completion event or the event XrEventDataSpaceDiscoveryResultsAvailableMETA.

If the asynchronous operation is successful, in the corresponding completion event, the runtime **must** set the XrEventDataSpaceDiscoveryCompleteMETA::`result` field to `XR_SUCCESS`.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event, the runtime **must** set the XrEventDataSpaceDiscoveryCompleteMETA::`result` field to an appropriate error code instead of `XR_SUCCESS`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to calling xrDiscoverSpacesMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpaceDiscoveryInfoMETA structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INITIALIZATION_FAILED
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SESSION_NOT_RUNNING
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_RATE_LIMITED_META
- XR_ERROR_VALIDATION_FAILURE

The XrSpaceDiscoveryInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceDiscoveryInfoMETA {
    XrStructureType                                 type;
    const void*                                     next;
    uint32_t                                        filterCount;
    const XrSpaceFilterBaseHeaderMETA* const *      filters;
} XrSpaceDiscoveryInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- filterCount is the number of filters that are passed in the filters parameter.
- filters is a pointer to an array of XrSpaceFilterBaseHeaderMETA pointers.

The XrSpaceDiscoveryInfoMETA structure contains information used to discover space(s).

Valid Usage (Implicit)

- The XR_META_spatial_entity_discovery extension **must** be enabled prior to using XrSpaceDiscoveryInfoMETA
- type **must** be XR_TYPE_SPACE_DISCOVERY_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If filterCount is not 0, filters **must** be a pointer to an array of filterCount valid XrSpaceFilterBaseHeaderMETA-based structures. See also: XrSpaceFilterComponentMETA, XrSpaceFilterUuidMETA

The XrSpaceFilterBaseHeaderMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceFilterBaseHeaderMETA {
    XrStructureType    type;
    const void*        next;
} XrSpaceFilterBaseHeaderMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next **must** be NULL

The XrSpaceFilterBaseHeaderMETA structure is meant to be used as the base header for filter types defined in this extension.

Valid Usage (Implicit)

- The XR_META_spatial_entity_discovery extension **must** be enabled prior to using XrSpaceFilterBaseHeaderMETA
- type **must** be one of the following XrStructureType values: XR_TYPE_SPACE_FILTER_COMPONENT_META, XR_TYPE_SPACE_FILTER_UUID_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

Two such filter types are defined in this extension: XrSpaceFilterUuidMETA and XrSpaceFilterComponentMETA.

The XrSpaceFilterUuidMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceFilterUuidMETA {
    XrStructureType     type;
    const void*         next;
    uint32_t            uuidCount;
    const XrUuidEXT*    uuids;
} XrSpaceFilterUuidMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` **must** be `NULL`
- `uuidCount` is the number of IDs that **should** be in the uuids array.
- `uuids` is the XrUuidEXT array (pointer to first element) to the IDs to be discovered.

The XrSpaceFilterUuidMETA structure contains information used to discover space(s) by ID.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to using XrSpaceFilterUuidMETA
- `type` **must** be `XR_TYPE_SPACE_FILTER_UUID_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

The XrSpaceFilterComponentMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceFilterComponentMETA {
    XrStructureType           type;
    const void*               next;
    XrSpaceComponentTypeFB    componentType;
} XrSpaceFilterComponentMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` **must** be `NULL`
- `componentType` is the XrSpaceComponentTypeFB component that is expected to be enabled for the spaces returned by discovery.

The XrSpaceFilterComponentMETA structure contains information used to discover Spatial Entities by components enabled.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to using XrSpaceFilterComponentMETA
- `type` **must** be `XR_TYPE_SPACE_FILTER_COMPONENT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `componentType` **must** be a valid XrSpaceComponentTypeFB value

The XrEventDataSpaceDiscoveryResultsAvailableMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrEventDataSpaceDiscoveryResultsAvailableMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
} XrEventDataSpaceDiscoveryResultsAvailableMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the `XrAsyncRequestIdFB` of the asynchronous request to discover spaces.

The XrEventDataSpaceDiscoveryResultsAvailableMETA event indicates there are results ready to be retrieved. Any number of these XrEventDataSpaceDiscoveryResultsAvailableMETA events **may** be queued, until the XrEventDataSpaceDiscoveryCompleteMETA event is queued. Once the XrEventDataSpaceDiscoveryCompleteMETA event is queued, there **must** not be any more

XrEventDataSpaceDiscoveryResultsAvailableMETA events queued.

Valid Usage (Implicit)

- The XR_META_spatial_entity_discovery extension **must** be enabled prior to using XrEventDataSpaceDiscoveryResultsAvailableMETA
- type **must** be XR_TYPE_EVENT_DATA_SPACE_DISCOVERY_RESULTS_AVAILABLE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataSpaceDiscoveryCompleteMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrEventDataSpaceDiscoveryCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpaceDiscoveryCompleteMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- requestId is the XrAsyncRequestIdFB of the asynchronous request to discover spaces.
- result the XrResult indicating the success, success with warnings, or failure of the Discovery operation.

The XrEventDataSpaceDiscoveryCompleteMETA event indicates that there **must** be no more XrEventDataSpaceDiscoveryResultsAvailableMETA queued and that Discovery has completed execution.

Potential XrEventDataSpaceDiscoveryCompleteMETA::result values include the following XrResult enumerants:

- XR_SUCCESS
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SPACE_INSUFFICIENT_RESOURCES_META
- XR_ERROR_SPACE_INSUFFICIENT_VIEW_META

- XR_ERROR_SPACE_PERMISSION_INSUFFICIENT_META
- XR_ERROR_SPACE_RATE_LIMITED_META
- XR_ERROR_SPACE_TOO_DARK_META
- XR_ERROR_SPACE_TOO_BRIGHT_META

Valid Usage (Implicit)

- The XR_META_spatial_entity_discovery extension **must** be enabled prior to using XrEventDataSpaceDiscoveryCompleteMETA
- type **must** be XR_TYPE_EVENT_DATA_SPACE_DISCOVERY_COMPLETE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.165.4. Retrieve Discovered Spaces

The xrRetrieveSpaceDiscoveryResultsMETA function is defined as:

```
// Provided by XR_META_spatial_entity_discovery
XrResult xrRetrieveSpaceDiscoveryResultsMETA(
    XrSession                                   session,
    XrAsyncRequestIdFB                          requestId,
    XrSpaceDiscoveryResultsMETA*                results);
```

Parameter Descriptions

- session is a handle to an XrSession.
- requestId is the XrAsyncRequestIdFB returned as part of the XrEventDataSpaceDiscoveryResultsAvailableMETA or XrEventDataSpaceDiscoveryCompleteMETA events.
- results is the XrSpaceDiscoveryResultsMETA structure used to get the number of results then to populate those results.

The xrRetrieveSpaceDiscoveryResultsMETA function is synchronous, and follows the 2-call idiom, where the first call is made to determine the number of results, populated in the XrSpaceDiscoveryResultsMETA::resultCountOutput. The application uses this value to initialize the XrSpaceDiscoveryResultsMETA::resultCapacityInput and XrSpaceDiscoveryResultsMETA::results fields. The second call to xrRetrieveSpaceDiscoveryResultsMETA **must** then populate the results field with whatever results are available. See Buffer Size Parameters for a detailed description of retrieving the required results size.

Note that after any results have been retrieved, those specific results will be unavailable for retrieval again. Application developers **can** choose to retrieve discovered Spatial Entities either after receiving an XrEventDataSpaceDiscoveryResultsAvailableMETA event or after receiving an XrEventDataSpaceDiscoveryCompleteMETA event. If application developers choose to retrieve after XrEventDataSpaceDiscoveryResultsAvailableMETA events (before the XrEventDataSpaceDiscoveryCompleteMETA event), more results **may** be discovered between the first and the second call to xrRetrieveSpaceDiscoveryResultsMETA. If this occurs, and if the application chose the result array capacity to match the XrSpaceDiscoveryResultsMETA::`resultCountOutput`, that capacity is no longer sufficient to receive all available results, so the second call will fail due to insufficient size. This will not lose results, and the application **can** begin the two-call process for xrRetrieveSpaceDiscoveryResultsMETA again.

xrPollEvent and xrRetrieveSpaceDiscoveryResultsMETA **may** be called simultaneously (without external synchronization).

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to calling xrRetrieveSpaceDiscoveryResultsMETA
- `session` **must** be a valid XrSession handle
- `results` **must** be a pointer to an XrSpaceDiscoveryResultsMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpaceDiscoveryResultsMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceDiscoveryResultsMETA {
    XrStructureType                type;
    const void*                    next;
    uint32_t                       resultCapacityInput;
    uint32_t                       resultCountOutput;
    XrSpaceDiscoveryResultMETA*    results;
} XrSpaceDiscoveryResultsMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `resultCapacityInput` is the capacity of the results array, or 0 to indicate a request to retrieve the required capacity.
- `resultCountOutput` is an output parameter containing the count of results for retrieval, or returns the required capacity in the case that resultCapacityInput is insufficient.
- `results` is a pointer to an array of XrSpaceDiscoveryResultMETA structures to populate with the spaces retrieved, but **can** be `NULL` if `resultCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `results` size.

The XrSpaceDiscoveryResultsMETA structure is used to retrieve all results from a Discovery operation.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to using XrSpaceDiscoveryResultsMETA
- `type` **must** be `XR_TYPE_SPACE_DISCOVERY_RESULTS_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `resultCapacityInput` is not `0`, `results` **must** be a pointer to an array of `resultCapacityInput` XrSpaceDiscoveryResultMETA structures

The XrSpaceDiscoveryResultMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_discovery
typedef struct XrSpaceDiscoveryResultMETA {
    XrSpace      space;
    XrUuidEXT    uuid;
} XrSpaceDiscoveryResultMETA;
```

Member Descriptions

- `space` is a space that complies with all the filters provided to Discovery call.
- `uuid` is the XrUuidEXT of the space.

The XrSpaceDiscoveryResultMETA structure contains a single Space result retrieved after Discovery returns results.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_discovery` extension **must** be enabled prior to using XrSpaceDiscoveryResultMETA

12.166.1. Overview

The `XR_META_spatial_entity_group_sharing` extension enables applications to share spatial entities to an application-specified group UUID. An application **can** share spatial entities with one or more group UUIDs, and query for spatial entities previously shared with a group UUID. A Group UUID is any application provided UUID. The Group will be established for the application simply by sharing spatial entities to it.

12.166.2. Check compatibility

The XrSystemSpatialEntityGroupSharingPropertiesMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_group_sharing
typedef struct XrSystemSpatialEntityGroupSharingPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialEntityGroupSharing;
} XrSystemSpatialEntityGroupSharingPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsSpatialEntityGroupSharing` is an `XrBool32` specifying if group sharing is supported.

An application **can** inspect whether the system is capable of group based sharing by extending the

XrSystemProperties with XrSystemSpatialEntityGroupSharingPropertiesMETA structure when calling xrGetSystemProperties.

In order to use XrShareSpacesRecipientGroupsMETA with xrShareSpacesMETA, the system **must** also support XR_META_spatial_entity_sharing. Please see XR_META_spatial_entity_sharing's section for how to check if XR_META_spatial_entity_sharing is supported.

In order to use XrSpaceGroupUuidFilterInfoMETA with xrQuerySpacesFB, the system **must** also support XR_FB_spatial_entity_query. Please see XR_FB_spatial_entity_query's section for how to check if XR_FB_spatial_entity_query is supported.

Valid Usage (Implicit)

- The XR_META_spatial_entity_group_sharing extension **must** be enabled prior to using XrSystemSpatialEntityGroupSharingPropertiesMETA
- type **must** be XR_TYPE_SYSTEM_SPATIAL_ENTITY_GROUP_SHARING_PROPERTIES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.166.3. Sharing Spaces to a Group UUID

An application **can** share spatial entities with any application provided UUID.

Once spatial entities are shared with this group UUID, the application **can** query for spatial entities previously shared with this group UUID.

Applications **can** share multiple spatial entities to the same group UUID.

Spatial entities will remain shared with the Group UUID for 30 days since the last successful share.

Any logged-in user using the same application may query for spatial entities shared with the Group UUID.

The XrShareSpacesRecipientGroupsMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_group_sharing with XR_META_spatial_entity_sharing
typedef struct XrShareSpacesRecipientGroupsMETA {
    XrStructureType    type;
    const void*        next;
    uint32_t           groupCount;
    XrUuid*            groups;
} XrShareSpacesRecipientGroupsMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `groupCount` is the number of elements in the `groups` list. The maximum supported count in a single request is 16.
- `groups` is a list of XrUuid defined by the application, which the spaces will be shared with.

XrShareSpacesRecipientGroupsMETA implements the XrShareSpacesRecipientBaseHeaderMETA base type. Where xrShareSpacesMETA specifies that a valid structure based on XrShareSpacesRecipientBaseHeaderMETA is to be passed, a valid XrShareSpacesRecipientGroupsMETA structure **may** be passed.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_group_sharing` extension **must** be enabled prior to using XrShareSpacesRecipientGroupsMETA
- `type` **must** be `XR_TYPE_SHARE_SPACES_RECIPIENT_GROUPS_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `groups` **must** be a pointer to an array of `groupCount` XrUuid structures
- The `groupCount` parameter **must** be greater than `0`

12.166.4. Query Spaces Shared with a Group UUID

The XrSpaceGroupUuidFilterInfoMETA structure is defined as:

```
// Provided by XR_FB_spatial_entity_query with XR_META_spatial_entity_group_sharing
typedef struct XrSpaceGroupUuidFilterInfoMETA {
    XrStructureType    type;
    const void*        next;
    XrUuid             groupUuid;
} XrSpaceGroupUuidFilterInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `groupUuid` is an XrUuid specifying which group UUID that the application wants to query for spaces shared within.

This structure is a space query filter for use with query functions introduced in the `XR_FB_spatial_entity_query` extension.

To query spaces shared with a group, the application **can** include the XrSpaceGroupUuidFilterInfoMETA filter in the query filters when calling xrQuerySpacesFB.

If XrSpaceGroupUuidFilterInfoMETA is passed into xrQuerySpacesFB and the group UUID is not found by the runtime, the runtime **must** return an `XR_ERROR_SPACE_GROUP_NOT_FOUND_META` as the XrEventDataSpaceQueryCompleteFB::`result`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_group_sharing` extension **must** be enabled prior to using XrSpaceGroupUuidFilterInfoMETA
- `type` **must** be `XR_TYPE_SPACE_GROUP_UUID_FILTER_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.166.5. New Structures

- Extending XrSystemProperties:
  - XrSystemSpatialEntityGroupSharingPropertiesMETA

If `XR_FB_spatial_entity_query` is supported:

- Extending XrSpaceQueryInfoBaseHeaderFB:
  - XrSpaceGroupUuidFilterInfoMETA

If `XR_META_spatial_entity_sharing` is supported:

- XrShareSpacesRecipientGroupsMETA

12.166.6. New Enum Constants

- `XR_META_SPATIAL_ENTITY_GROUP_SHARING_EXTENSION_NAME`

- XR_META_spatial_entity_group_sharing_SPEC_VERSION
- Extending XrResult:
  - XR_ERROR_SPACE_GROUP_NOT_FOUND_META
- Extending XrStructureType:
  - XR_TYPE_SHARE_SPACES_RECIPIENT_GROUPS_META
  - XR_TYPE_SPACE_GROUP_UUID_FILTER_INFO_META
  - XR_TYPE_SYSTEM_SPATIAL_ENTITY_GROUP_SHARING_PROPERTIES_META

12.167.1. Overview

This extension expands on the concept of spatial entities to include a way for a spatial entity to represent a triangle mesh that describes 3D geometry of the spatial entity in a scene. Spatial entities are defined in `XR_FB_spatial_entity` extension using the Entity-Component System. The triangle mesh is a component type that **may** be associated to a spatial entity.

12.167.2. Retrieving a triangle mesh

The xrGetSpaceTriangleMeshMETA function is defined as:

```
// Provided by XR_META_spatial_entity_mesh
XrResult xrGetSpaceTriangleMeshMETA(
    XrSpace                                     space,
    const XrSpaceTriangleMeshGetInfoMETA*       getInfo,
    XrSpaceTriangleMeshMETA*                    triangleMeshOutput);
```

Parameter Descriptions

- `space` is a handle to an XrSpace.
- `getInfo` exists for extensibility purposes. It is `NULL` or a pointer to a valid XrSpaceTriangleMeshGetInfoMETA.
- `triangleMeshOutput` is the output parameter that points to an XrSpaceTriangleMeshMETA.

The xrGetSpaceTriangleMeshMETA function is used by the application to perform the two calls required to obtain a triangle mesh associated to a spatial entity specified by `space`.

The spatial entity `space` **must** have the `XR_SPACE_COMPONENT_TYPE_TRIANGLE_MESH_META` component type enabled, otherwise this function will return `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`.

Valid Usage (Implicit)

- The XR_META_spatial_entity_mesh extension **must** be enabled prior to calling xrGetSpaceTriangleMeshMETA
- space **must** be a valid XrSpace handle
- getInfo **must** be a pointer to a valid XrSpaceTriangleMeshGetInfoMETA structure
- triangleMeshOutput **must** be a pointer to an XrSpaceTriangleMeshMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The XrSpaceTriangleMeshGetInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_mesh
typedef struct XrSpaceTriangleMeshGetInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrSpaceTriangleMeshGetInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_mesh` extension **must** be enabled prior to using XrSpaceTriangleMeshGetInfoMETA
- `type` **must** be `XR_TYPE_SPACE_TRIANGLE_MESH_GET_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSpaceTriangleMeshMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_mesh
typedef struct XrSpaceTriangleMeshMETA {
    XrStructureType    type;
    void*              next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector3f*        vertices;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    uint32_t*          indices;
} XrSpaceTriangleMeshMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCapacityInput` is an input parameter for the application to specify the capacity of the `vertices` array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is an output parameter that will hold the number of vertices written in the output array, or the required capacity in the case that `vertexCapacityInput` is insufficient. The returned value **must** be equal to or larger than 3.
- `vertices` is a pointer to an array of XrVector3f, but **can** be `NULL` if `vertexCapacityInput` is 0. The vertices are defined in the coordinate frame of XrSpace to which this struct is associated.
- `indexCapacityInput` is an input parameter for the application to specify the capacity of the `indices` array, or 0 to indicate a request to retrieve the required capacity.
- `indexCountOutput` is an output parameter that will hold the number of indices written in the output array, or the required capacity in the case that `indexCapacityInput` is insufficient. The returned value **must** be a multiple of 3.
- `indices` is a pointer to an array of `uint32_t`, but **can** be `NULL` if `indexCapacityInput` is 0. Each element refers to a vertex in `vertices`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `vertices` and `indices` array sizes.

The XrSpaceTriangleMeshMETA structure **can** be used by the application to perform the two calls required to obtain a triangle mesh associated to a specified spatial entity.

The output values written in the `indices` array represent indices of vertices: Three consecutive elements represent a triangle with a counter-clockwise winding order.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_mesh` extension **must** be enabled prior to using XrSpaceTriangleMeshMETA
- `type` **must** be `XR_TYPE_SPACE_TRIANGLE_MESH_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.168.1. Overview

XR_META_spatial_entity_persistence enables saving and erasing Spatial Entities, allowing them to be retrieved and tracked across different sessions and over time.

Technical overview

XR_META_spatial_entity_persistence is the next generation of Meta spatial entity storage management, following the previous generation offered through XR_FB_spatial_entity_storage and XR_FB_spatial_entity_storage_batch which are now obsolete.

If the XR_SPACE_COMPONENT_TYPE_STORABLE_FB component is enabled on a space, as defined in XR_FB_spatial_entity, application developers **may** save and erase app-created XrSpace corresponding to Meta spatial entities. XR_META_spatial_entity_persistence is expected to be used alongside XR_META_spatial_entity_discovery for spatial entity discovery/loading and retrieval.

12.168.2. Inspect System Capability

The XrSystemSpacePersistencePropertiesMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_persistence
typedef struct XrSystemSpacePersistencePropertiesMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           supportsSpacePersistence;
} XrSystemSpacePersistencePropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsSpacePersistence` is an `XrBool32`, indicating if current system supports space persistence.

An application **can** inspect whether the system is capable of supporting space persistence by extending the XrSystemProperties with XrSystemSpacePersistencePropertiesMETA structure when calling xrGetSystemProperties.

If and only if a runtime returns `XR_FALSE` for `supportsSpacePersistence`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrSaveSpacesMETA and xrEraseSpacesMETA.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_persistence` extension **must** be enabled prior to using XrSystemSpacePersistencePropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_SPACE_PERSISTENCE_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Save Spaces

The xrSaveSpacesMETA function is defined as:

```
// Provided by XR_META_spatial_entity_persistence
XrResult xrSaveSpacesMETA(
    XrSession                                   session,
    const XrSpacesSaveInfoMETA*                 info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the input struct XrSpacesSaveInfoMETA for the save operation.
- `requestId` is a pointer to an `XrAsyncRequestIdFB` value and is an output parameter. The variable it points to is populated with the ID of this asynchronous request.

The xrSaveSpacesMETA function persists the space(s) provided. The scope of the save operation is same-user, same-device, same-app. This is an asynchronous operation. Completion results are conveyed in the event XrEventDataSpacesSaveResultMETA.

The runtime **must** return XR_ERROR_HANDLE_INVALID from xrSaveSpacesMETA if any of the XrSpacesSaveInfoMETA::spaces are XR_NULL_HANDLE or otherwise invalid (e.g. not a Meta Spatial Entity XrSpace). Note that saving an entity which has already been saved previously is valid and a no-op.

The runtime **must** return XR_ERROR_VALIDATION_FAILURE from xrSaveSpacesMETA if either one of the following is true:

- The XrSpacesSaveInfoMETA::spaces is NULL.
- The XrSpacesSaveInfoMETA::spaceCount is 0.

The length of the array XrSpacesSaveInfoMETA::spaces **must** have a size of at least XrSpacesSaveInfoMETA::spaceCount.

When initiated unsuccessfully (i.e. the immediate return value of the xrSaveSpacesMETA call is an error), the save operation terminates without saving any entities, and no save result event is queued.

When initiated successfully (i.e. the immediate return value of the xrSaveSpacesMETA call is not an error), the full save operation is asynchronous. The runtime **must** queue an XrEventDataSpacesSaveResultMETA event when the save operation completes, either successfully, qualified success (warning), or with an error. See the XrEventDataSpacesSaveResultMETA for which XrResult enumerants **may** be returned in the event.

Note that if the XrEventDataSpacesSaveResultMETA::result is an error, it is possible that any subset of the Spatial Entity Spaces were saved.

Valid Usage (Implicit)

- The XR_META_spatial_entity_persistence extension **must** be enabled prior to calling xrSaveSpacesMETA
- session **must** be a valid XrSession handle
- info **must** be a pointer to a valid XrSpacesSaveInfoMETA structure
- requestId **must** be a pointer to an XrAsyncRequestIdFB value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING
- XR_SESSION_NOT_FOCUSED

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INITIALIZATION_FAILED
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SESSION_NOT_RUNNING
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_SPACE_RATE_LIMITED_META
- XR_ERROR_VALIDATION_FAILURE

The XrSpacesSaveInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_persistence
typedef struct XrSpacesSaveInfoMETA {
    XrStructureType    type;
    const void*        next;
    uint32_t           spaceCount;
    XrSpace*           spaces;
} XrSpacesSaveInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- spaceCount is the number of spaces in the spaces array.
- spaces is the XrSpace array (pointer to first element) of spaces to be saved.

The XrSpacesSaveInfoMETA structure contains information used to save one or more spaces with xrSaveSpacesMETA.

Valid Usage (Implicit)

- The XR_META_spatial_entity_persistence extension **must** be enabled prior to using XrSpacesSaveInfoMETA
- type **must** be XR_TYPE_SPACES_SAVE_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- spaces **must** be a pointer to an array of spaceCount XrSpace handles
- The spaceCount parameter **must** be greater than 0

The XrEventDataSpacesSaveResultMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_persistence
typedef struct XrEventDataSpacesSaveResultMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpacesSaveResultMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- requestId is the XrAsyncRequestIdFB of the asynchronous request to save spaces.
- result is an XrResult that describes whether the request succeeded, had any warnings, or if an error occurred.

This event conveys the results of the asynchronous operation started by xrSaveSpacesMETA.

The XrEventDataSpacesSaveResultMETA event contains the result of the save/write operation, as well as the XrAsyncRequestIdFB of the operation.

Potential XrEventDataSpacesSaveResultMETA::result values include the following XrResult enumerants:

Async Return Codes

XrEventDataSpacesSaveResultMETA::`result` values:

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SPACE_INSUFFICIENT_RESOURCES_META`
- `XR_ERROR_SPACE_STORAGE_AT_CAPACITY_META`
- `XR_ERROR_SPACE_INSUFFICIENT_VIEW_META`
- `XR_ERROR_SPACE_PERMISSION_INSUFFICIENT_META`
- `XR_ERROR_SPACE_RATE_LIMITED_META`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_SPACE_RATE_LIMITED_META`
- `XR_ERROR_VALIDATION_FAILURE`

Valid Usage (Implicit)

- The `XR_META_spatial_entity_persistence` extension **must** be enabled prior to using XrEventDataSpacesSaveResultMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_SPACES_SAVE_RESULT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Erase Spaces

The xrEraseSpacesMETA function is defined as:

```
// Provided by XR_META_spatial_entity_persistence
XrResult xrEraseSpacesMETA(
    XrSession                                   session,
    const XrSpacesEraseInfoMETA*                info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `info` contains the input struct XrSpacesEraseInfoMETA for the erase operation.
- `requestId` is a pointer to an `XrAsyncRequestIdFB` value and is an output parameter. The variable it points to is populated with the ID of this asynchronous request.

The xrEraseSpacesMETA function erases space(s) from storage. The scope of the erase operation is same-user, same-device, same-app. After a successful erase operation, the XrSpace remains valid in the current session until the application destroys the space handle or its parent, the session handle. That is, this does not destroy spaces from tracking, but if erase is successful, the spaces **must** be ephemeral again (undiscoverable across sessions).

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataSpacesEraseResultMETA.

The runtime **must** return `XR_ERROR_HANDLE_INVALID` from xrEraseSpacesMETA if any of the XrSpacesEraseInfoMETA::`spaces` are XR_NULL_HANDLE or otherwise invalid (e.g. not a Meta Spatial Entity XrSpace). Note that it is valid for a Meta Spatial Entity space that has not previously been saved to be included in an erase operation; that portion of the operation is a no-op.

At least one of XrSpacesEraseInfoMETA::`uuids` or XrSpacesEraseInfoMETA::`spaces` **must** be populated. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` from xrEraseSpacesMETA if either of the following are true:

- The XrSpacesEraseInfoMETA::`spaces` are `NULL` and the XrSpacesEraseInfoMETA::`uuids` are `NULL`.
- The XrSpacesEraseInfoMETA::`spaceCount` is 0 and the XrSpacesEraseInfoMETA::`uuidCount` is 0.

The lengths of the arrays **must** equal the corresponding counts (e.g. `spaceCount` **must** equal the length of the `spaces` array).

When initiated unsuccessfully (i.e. the immediate return value of the xrEraseSpacesMETA call is an error), the erase operation terminates without erasing any Spatial Entities, and no erase result event is queued.

When initiated successfully (i.e. the immediate return value of the xrEraseSpacesMETA call is not an error), the full erase operation is asynchronous. The runtime **must** queue an XrEventDataSpacesEraseResultMETA event when the erase operation completes, either successfully, qualified success (warning), or with an error. See the XrEventDataSpacesEraseResultMETA for which XrResult enumerants **may** be returned in the event.

Note that if the XrEventDataSpacesEraseResultMETA::`result` is an error, it is possible that any subset of the Spatial Entity Spaces were erased.

Valid Usage (Implicit)

- The XR_META_spatial_entity_persistence extension **must** be enabled prior to calling xrEraseSpacesMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrSpacesEraseInfoMETA structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING
- XR_SESSION_NOT_FOCUSED

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INITIALIZATION_FAILED
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SESSION_NOT_RUNNING
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_SPACE_RATE_LIMITED_META
- XR_ERROR_VALIDATION_FAILURE

The XrSpacesEraseInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_persistence
typedef struct XrSpacesEraseInfoMETA {
    XrStructureType    type;
    const void*        next;
    uint32_t           spaceCount;
    XrSpace*           spaces;
    uint32_t           uuidCount;
    XrUuidEXT*         uuids;
} XrSpacesEraseInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `spaceCount` is the number of spaces in the `spaces` array.
- `spaces` is the XrSpace array (pointer to first element) of spaces to be erased.
- `uuidCount` is the number of UUIDs in the `uuids` array.
- `uuids` is the XrUuidEXT array (pointer to first element) of spaces to be erased.

The XrSpacesEraseInfoMETA structure contains information used to erase one or more spaces with xrEraseSpacesMETA. Both the `spaces` and `uuids` arrays are optional, but at least one of them must contain at least one element. See xrEraseSpacesMETA for required validation behavior by the runtime.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_persistence` extension **must** be enabled prior to using XrSpacesEraseInfoMETA
- `type` **must** be `XR_TYPE_SPACES_ERASE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `spaceCount` is not `0`, `spaces` **must** be a pointer to an array of `spaceCount` XrSpace handles
- If `uuidCount` is not `0`, `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures

The XrEventDataSpacesEraseResultMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_persistence
typedef struct XrEventDataSpacesEraseResultMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataSpacesEraseResultMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `requestId` is the `XrAsyncRequestIdFB` of the asynchronous request to erase spaces.
- `result` is an XrResult that describes whether the request succeeded, had any warnings, or if an error occurred.

The XrEventDataSpacesEraseResultMETA event contains the result of the erase/write operation, as well as the `XrAsyncRequestIdFB` of the operation.

Potential XrEventDataSpacesEraseResultMETA::`result` values include the following XrResult enumerants:

Async Return Codes

XrEventDataSpacesEraseResultMETA::`result` values:

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_SPACE_INSUFFICIENT_RESOURCES_META`
- `XR_ERROR_SPACE_PERMISSION_INSUFFICIENT_META`
- `XR_ERROR_SPACE_RATE_LIMITED_META`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_SPACE_RATE_LIMITED_META`
- `XR_ERROR_VALIDATION_FAILURE`

Valid Usage (Implicit)

- The XR_META_spatial_entity_persistence extension **must** be enabled prior to using XrEventDataSpacesEraseResultMETA
- type **must** be XR_TYPE_EVENT_DATA_SPACES_ERASE_RESULT_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.169.1. Overview

This extension expands on the concept of spatial entities to include a way for a spatial entity to represent a room mesh. A room mesh provides 3D geometry and semantic information of a room in a scene. Spatial entities are defined in the `XR_FB_spatial_entity` extension using the Entity-Component System. A spatial entity **may** have the room mesh component type associated with it.

12.169.2. Retrieving a room mesh

The xrGetSpaceRoomMeshMETA function is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
XrResult xrGetSpaceRoomMeshMETA(
    XrSpace                                     space,
    const XrSpaceRoomMeshGetInfoMETA*           getInfo,
    XrRoomMeshMETA*                             roomMeshOutput);
```

Parameter Descriptions

- `space` is a handle to an XrSpace.
- `getInfo` is the input parameter that points to a valid XrSpaceRoomMeshGetInfoMETA.
- `roomMeshOutput` is the output parameter that points to a valid XrRoomMeshMETA.

The xrGetSpaceRoomMeshMETA function is used by the application to perform the two calls required to obtain a room mesh associated with a spatial entity specified by `space`.

If the spatial entity `space` does not have the `XR_SPACE_COMPONENT_TYPE_ROOM_MESH_META` component type enabled, this function **must** return `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_room_mesh` extension **must** be enabled prior to calling xrGetSpaceRoomMeshMETA
- `space` **must** be a valid XrSpace handle
- `getInfo` **must** be a pointer to a valid XrSpaceRoomMeshGetInfoMETA structure
- `roomMeshOutput` **must** be a pointer to an XrRoomMeshMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The XrSpaceRoomMeshGetInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
typedef struct XrSpaceRoomMeshGetInfoMETA {
    XrStructureType               type;
    const void*                   next;
    uint32_t                      recognizedSemanticLabelCount;
    const XrSemanticLabelMETA*    recognizedSemanticLabels;
} XrSpaceRoomMeshGetInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `recognizedSemanticLabelCount` is an input parameter for the application to specify the number of elements in the `recognizedSemanticLabels` array.
- `recognizedSemanticLabels` is an input parameter for the application to specify an array of XrSemanticLabelMETA. The runtime **must** return only the semantic labels specified in this list in XrRoomMeshFaceMETA::`semanticLabel`. The runtime **must** return semantic labels that are not specified in this list as `XR_SEMANTIC_LABEL_UNKNOWN_META`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_room_mesh` extension **must** be enabled prior to using XrSpaceRoomMeshGetInfoMETA
- `type` **must** be `XR_TYPE_SPACE_ROOM_MESH_GET_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `recognizedSemanticLabelCount` is not `0`, `recognizedSemanticLabels` **must** be a pointer to an array of `recognizedSemanticLabelCount` valid XrSemanticLabelMETA values

The XrRoomMeshMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
typedef struct XrRoomMeshMETA {
    XrStructureType        type;
    void*                  next;
    uint32_t               vertexCapacityInput;
    uint32_t               vertexCountOutput;
    XrVector3f*            vertices;
    uint32_t               faceCapacityInput;
    uint32_t               faceCountOutput;
    XrRoomMeshFaceMETA*    faces;
} XrRoomMeshMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `vertexCapacityInput` is an input parameter for the application to specify the capacity of the `vertices` array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is an output parameter that will hold the number of vertices written in the output array, or the required capacity in the case that `vertexCapacityInput` is insufficient. The returned value **must** be equal to or larger than 4.
- `vertices` is a pointer to an array of XrVector3f, but **can** be `NULL` if `vertexCapacityInput` is 0. The vertices are defined in the coordinate frame of XrSpace to which this struct is associated.
- `faceCapacityInput` is an input parameter for the application to specify the capacity of the `faces` array, or 0 to indicate a request to retrieve the required capacity.
- `faceCountOutput` is an output parameter that will hold the number of faces written in the output array, or the required capacity in the case that `faceCapacityInput` is insufficient.
- `faces` is a pointer to an array of XrRoomMeshFaceMETA, but **can** be `NULL` if `faceCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `vertices` and `faces` array sizes.

The application uses the XrRoomMeshMETA structure to perform the two calls required to obtain a room mesh associated with a specified spatial entity.

The output values written in the `faces` array represent faces of the room mesh. Each face is represented with an XrRoomMeshFaceMETA structure as well as an XrRoomMeshFaceIndicesMETA structure that **can** be separately obtained by using the xrGetSpaceRoomMeshFaceIndicesMETA function. The faces of the room mesh **must** define a closed 3D volume. The faces **must** not have overlaps with each other.

Valid Usage (Implicit)

- The XR_META_spatial_entity_room_mesh extension **must** be enabled prior to using XrRoomMeshMETA
- type **must** be XR_TYPE_ROOM_MESH_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If vertexCapacityInput is not 0, vertices **must** be a pointer to an array of vertexCapacityInput XrVector3f structures
- If faceCapacityInput is not 0, faces **must** be a pointer to an array of faceCapacityInput XrRoomMeshFaceMETA structures

The XrRoomMeshFaceMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
typedef struct XrRoomMeshFaceMETA {
    XrUuid                 uuid;
    XrUuid                 parentUuid;
    XrSemanticLabelMETA    semanticLabel;
} XrRoomMeshFaceMETA;
```

Member Descriptions

- uuid is a valid XrUuid of this face.
- parentUuid is a valid XrUuid of the parent face of this face if the parent face exists; otherwise, it is an all-zero XrUuid.
- semanticLabel is the semantic label of this face, which **must** be one of the semantic labels specified in XrSpaceRoomMeshGetInfoMETA::recognizedSemanticLabels or XR_SEMANTIC_LABEL_UNKNOWN_META.

Valid Usage (Implicit)

- The XR_META_spatial_entity_room_mesh extension **must** be enabled prior to using XrRoomMeshFaceMETA
- semanticLabel **must** be a valid XrSemanticLabelMETA value

12.169.3. Retrieving indices of a face of a room mesh

The xrGetSpaceRoomMeshFaceIndicesMETA function is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
XrResult xrGetSpaceRoomMeshFaceIndicesMETA(
    XrSpace                                     space,
    const XrUuid*                               faceUuid,
    XrRoomMeshFaceIndicesMETA*                  roomMeshFaceIndicesOutput);
```

Parameter Descriptions

- `space` is a handle to an XrSpace.
- `faceUuid` is the input parameter that points to a valid XrUuid obtained from XrRoomMeshFaceMETA::`uuid`.
- `roomMeshFaceIndicesOutput` is the output parameter that points to a valid XrRoomMeshFaceIndicesMETA.

The xrGetSpaceRoomMeshFaceIndicesMETA function is used by the application to perform the two calls required to obtain indices of a face specified by `faceUuid` of a room mesh associated with a spatial entity specified by `space`.

If the spatial entity `space` does not have the `XR_SPACE_COMPONENT_TYPE_ROOM_MESH_META` component type enabled, this function **must** return `XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_room_mesh` extension **must** be enabled prior to calling xrGetSpaceRoomMeshFaceIndicesMETA
- `space` **must** be a valid XrSpace handle
- `faceUuid` **must** be a pointer to a valid XrUuid structure
- `roomMeshFaceIndicesOutput` **must** be a pointer to an XrRoomMeshFaceIndicesMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SPACE_COMPONENT_NOT_ENABLED_FB
- XR_ERROR_VALIDATION_FAILURE

The XrRoomMeshFaceIndicesMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_room_mesh
typedef struct XrRoomMeshFaceIndicesMETA {
    XrStructureType    type;
    void*              next;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    uint32_t*          indices;
} XrRoomMeshFaceIndicesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `indexCapacityInput` is an input parameter for the application to specify the capacity of the `indices` array, or 0 to indicate a request to retrieve the required capacity.
- `indexCountOutput` is an output parameter that will hold the number of indices written in the output array, or the required capacity in the case that `indexCapacityInput` is insufficient. The returned value **must** be a multiple of 3.
- `indices` is a pointer to an array of `uint32_t`, but **can** be `NULL` if `indexCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `indices` array sizes.

The XrRoomMeshFaceIndicesMETA structure **can** be used by the application to perform the two calls required to obtain indices of a face of a room mesh associated with a specified spatial entity.

The geometry of a face is represented as a set of triangles. The output values written in the `indices` array represent indices of the vertices obtained in XrRoomMeshMETA::`vertices`. Three consecutive elements represent a triangle with a counter-clockwise winding order. Each face of a room mesh **must** be a planar face; i.e. the vertices of a face **must** be coplanar.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_room_mesh` extension **must** be enabled prior to using XrRoomMeshFaceIndicesMETA
- `type` **must** be `XR_TYPE_ROOM_MESH_FACE_INDICES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `indexCapacityInput` is not `0`, `indices` **must** be a pointer to an array of `indexCapacityInput` `uint32_t` values

12.170.1. Overview

This extension defines semantic labels to describe semantic meanings of an associated spatial entity, or parts of an associated spatial entity. Spatial entities are defined in the `XR_FB_spatial_entity` extension using the Entity-Component System.

12.170.2. Label enumeration

The XrSemanticLabelMETA enumeration is defined as:

```
// Provided by XR_META_spatial_entity_semantic_label
typedef enum XrSemanticLabelMETA {
    XR_SEMANTIC_LABEL_UNKNOWN_META = 0,
    XR_SEMANTIC_LABEL_FLOOR_META = 1,
    XR_SEMANTIC_LABEL_CEILING_META = 2,
    XR_SEMANTIC_LABEL_WALL_FACE_META = 3,
    XR_SEMANTIC_LABEL_INNER_WALL_FACE_META = 4,
    XR_SEMANTIC_LABEL_INVISIBLE_WALL_FACE_META = 5,
    XR_SEMANTIC_LABEL_DOOR_FRAME_META = 6,
    XR_SEMANTIC_LABEL_WINDOW_FRAME_META = 7,
    XR_SEMANTIC_LABEL_MAX_ENUM_META = 0x7FFFFFFF
} XrSemanticLabelMETA;
```

Enumerant Descriptions

- `XR_SEMANTIC_LABEL_UNKNOWN_META` — Unknown. This is a valid label that is used when the runtime is not able to classify the entity using another label, or when the application does not recognize the label.
- `XR_SEMANTIC_LABEL_FLOOR_META` — Floor of a room or space.
- `XR_SEMANTIC_LABEL_CEILING_META` — Ceiling of a room or space.
- `XR_SEMANTIC_LABEL_WALL_FACE_META` — Wall face of a room or space. Wall faces, along with invisible wall faces, are used to define the outer boundary of a room.
- `XR_SEMANTIC_LABEL_INNER_WALL_FACE_META` — Inner wall face, which is a wall face that exists inside a room and is not connected to the outer boundary of the room. For example, a pillar that exists at the center of a room **may** be represented by using four inner wall faces.
- `XR_SEMANTIC_LABEL_INVISIBLE_WALL_FACE_META` — Invisible wall face, which is used to conceptually separate a space (e.g., separate a living space from a kitchen space in an open floor plan house even though there is no real wall between the two spaces).
- `XR_SEMANTIC_LABEL_DOOR_FRAME_META` — Door frame, which usually exists on a wall face.
- `XR_SEMANTIC_LABEL_WINDOW_FRAME_META` — Window frame, which usually exists on a wall face.

12.171.1. Overview

The `XR_META_spatial_entity_sharing` extension enables applications to share spatial entities.

This base extension provides a generic space sharing endpoint. This extension depends on other extensions (such as `XR_META_spatial_entity_group_sharing`) to define concrete "recipient info" structures, which are passed into the generic endpoint introduced in this extension.

The scope/lifetime of the sharing action is dependent on the recipient type of the sharing. Therefore, the scope/lifetime of the sharing action is defined in the extensions which provide concrete "recipient info" structures.

`XR_META_spatial_entity_sharing` is a more generic and extendable alternative to `XR_FB_spatial_entity_sharing` (which is tightly coupled with XrSpaceUserFB).

12.171.2. Check compatibility

The XrSystemSpatialEntitySharingPropertiesMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_sharing
typedef struct XrSystemSpatialEntitySharingPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsSpatialEntitySharing;
} XrSystemSpatialEntitySharingPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsSpatialEntitySharing` is an `XrBool32` specifying if the spatial entity sharing is supported.

An application **can** inspect whether the system is capable of Spatial Entity Sharing by extending the XrSystemProperties with XrSystemSpatialEntitySharingPropertiesMETA structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsSpatialEntitySharing`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrShareSpacesMETA.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_sharing` extension **must** be enabled prior to using XrSystemSpatialEntitySharingPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_SPATIAL_ENTITY_SHARING_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.171.3. Sharing Spaces

The xrShareSpacesMETA function is defined as:

```
// Provided by XR_META_spatial_entity_sharing
XrResult xrShareSpacesMETA(
    XrSession                                   session,
    const XrShareSpacesInfoMETA*                info,
    XrAsyncRequestIdFB*                         requestId);
```

Parameter Descriptions

- `session` is an XrSession in which the spatial entity will be active.
- `info` is a pointer to XrShareSpacesInfoMETA structure to specify the spatial entity sharing details.
- `requestId` is a pointer to an `XrAsyncRequestIdFB` variable in which the generated async request ID will be stored. It is used to identify the corresponding XrEventDataShareSpacesCompleteMETA completion event.

The application **may** use the xrShareSpacesMETA function to share spaces (XrSpace) if the `XR_SPACE_COMPONENT_TYPE_SHARABLE_FB` component has been enabled on the space.

This is an asynchronous operation. Completion results are conveyed in the event XrEventDataShareSpacesCompleteMETA.

If the asynchronous operation is scheduled successfully, the runtime **must** return `XR_SUCCESS`.

If and only if the runtime returns `XR_SUCCESS`, the runtime **must** queue a single XrEventDataShareSpacesCompleteMETA event identified with a `requestId` field matching the value output by this function, referred to as the "corresponding completion event."

(If the runtime returns anything other than `XR_SUCCESS`, the runtime **must** not queue any XrEventDataShareSpacesCompleteMETA events with `requestId` field matching the `requestId` populated by this function.)

If the asynchronous operation is successful, the runtime **must** set the XrEventDataShareSpacesCompleteMETA::`result` field to `XR_SUCCESS` in the corresponding completion event.

If the asynchronous operation is scheduled but not successful, in the corresponding completion event, the runtime **must** set the XrEventDataShareSpacesCompleteMETA::`result` field to an appropriate error code instead of `XR_SUCCESS`.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_sharing` extension **must** be enabled prior to calling xrShareSpacesMETA
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrShareSpacesInfoMETA structure
- `requestId` **must** be a pointer to an `XrAsyncRequestIdFB` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrShareSpacesInfoMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_sharing
typedef struct XrShareSpacesInfoMETA {
    XrStructureType                                 type;
    const void*                                     next;
    uint32_t                                        spaceCount;
    XrSpace*                                        spaces;
    const XrShareSpacesRecipientBaseHeaderMETA*     recipientInfo;
} XrShareSpacesInfoMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- spaceCount is the count spaces populated in the spaces field of this request.
- spaces is an array pointer of type XrSpace containing all spaces to be shared
- recipientInfo is a structure based on XrShareSpacesRecipientBaseHeaderMETA, defining the target recipient of the shared spaces.

Valid Usage (Implicit)

- The XR_META_spatial_entity_sharing extension **must** be enabled prior to using XrShareSpacesInfoMETA
- type **must** be XR_TYPE_SHARE_SPACES_INFO_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- spaces **must** be a pointer to an array of spaceCount XrSpace handles
- recipientInfo **must** be a pointer to a valid XrShareSpacesRecipientBaseHeaderMETA-based structure. See also: XrShareSpacesRecipientGroupsMETA
- The spaceCount parameter **must** be greater than 0

The XrShareSpacesRecipientBaseHeaderMETA structure is defined as:

```
// Provided by XR_META_spatial_entity_sharing
typedef struct XrShareSpacesRecipientBaseHeaderMETA {
    XrStructureType    type;
    const void*        next;
} XrShareSpacesRecipientBaseHeaderMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.

XrShareSpacesRecipientBaseHeaderMETA is designed to be an abstract base struct which is to be extended by other structures.

Any valid structure that identifies XrShareSpacesRecipientBaseHeaderMETA as its parent structure **may** be provided anywhere a valid XrShareSpacesRecipientBaseHeaderMETA is specified to be passed.

Valid Usage (Implicit)

- The XR_META_spatial_entity_sharing extension **must** be enabled prior to using XrShareSpacesRecipientBaseHeaderMETA
- type **must** be XR_TYPE_SHARE_SPACES_RECIPIENT_GROUPS_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataShareSpacesCompleteMETA event structure is defined as:

```
// Provided by XR_META_spatial_entity_sharing
typedef struct XrEventDataShareSpacesCompleteMETA {
    XrStructureType       type;
    const void*           next;
    XrAsyncRequestIdFB    requestId;
    XrResult              result;
} XrEventDataShareSpacesCompleteMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `requestId` is an `XrAsyncRequestIdFB` that identifies which request this event is referring to.
- `result` is an XrResult that specifies the request result. The valid `result` values are: `XR_SUCCESS`, `XR_ERROR_RUNTIME_FAILURE`, `XR_ERROR_SPACE_NETWORK_TIMEOUT_FB`, and `XR_ERROR_SPACE_NETWORK_REQUEST_FAILED_FB`.

This event conveys the results of the asynchronous operation started by xrShareSpacesMETA.

Valid Usage (Implicit)

- The `XR_META_spatial_entity_sharing` extension **must** be enabled prior to using XrEventDataShareSpacesCompleteMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_SHARE_SPACES_COMPLETE_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.172.1. Overview

The XR_META_tile_properties extension allows the application to provide a hint to the OpenXR implementation about the tile properties of the application's main render pass.

OpenXR runtimes do not have access to the application's frame buffers and therefore cannot get the tile properties without providing an API for the application to pass those tile properties to the OpenXR runtime.

12.172.2. Passing Tile Properties

Applications **should** use the returned tile properties from functions provided by the VK_QCOM_tile_properties Vulkan extension to get the tile properties of the application's main render pass and copy those properties to an XrTilePropertiesMETA structure to use in a call to xrSetTilePropertiesHintMETA. These tile properties **may** be used for various optimizations in the OpenXR implementation, such as providing tile aligned resolutions for XR_META_recommended_layer_resolution and optimized fragment density maps when foveated rendering is enabled.

```
// Provided by XR_META_tile_properties_hint
XrResult xrSetTilePropertiesHintMETA(
    XrSession                                   session,
    const XrTilePropertiesHintMETA*             properties);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- properties is an XrTilePropertiesHintMETA that provides the tile property data.

xrSetTilePropertiesHintMETA allows the application to provide a hint to the OpenXR runtime about the GPU tiling properties to be used for internal optimizations, such as providing tile aligned resolutions from xrGetRecommendedLayerResolutionMETA and tile aligned fragment density maps for foveated swapchains.

Valid Usage (Implicit)

- The XR_META_tile_properties_hint extension **must** be enabled prior to calling xrSetTilePropertiesHintMETA
- `session` **must** be a valid XrSession handle
- `properties` **must** be a pointer to a valid XrTilePropertiesHintMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrTilePropertiesHintMETA structure is defined as:

```
// Provided by XR_META_tile_properties_hint
typedef struct XrTilePropertiesHintMETA {
    XrStructureType                type;
    void*                          next;
    uint32_t                       propertiesCount;
    const XrTilePropertiesMETA*    properties;
} XrTilePropertiesHintMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `propertiesCount` is the number of properties in the `properties` array.
- `properties` is an array of XrTilePropertiesMETA corresponding to a single render pass.

Each XrTilePropertiesMETA in the XrTilePropertiesHintMETA::properties array **should** correspond to a `VkTilePropertiesQCOM` passed by `vkGetDynamicRenderingTilePropertiesQCOM` or `vkGetFramebufferTilePropertiesQCOM`.

Valid Usage (Implicit)

- The `XR_META_tile_properties_hint` extension **must** be enabled prior to using XrTilePropertiesHintMETA
- `type` **must** be `XR_TYPE_TILE_PROPERTIES_HINT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `properties` **must** be a pointer to an array of `propertiesCount` valid XrTilePropertiesMETA structures
- The `propertiesCount` parameter **must** be greater than `0`

The XrTilePropertiesMETA structure is defined as:

```
// Provided by XR_META_tile_properties_hint
typedef struct XrTilePropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrExtent3DiMETA    tileDimensions;
    XrExtent2Di        apronDimensions;
    XrOffset2Di        origin;
} XrTilePropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `tileDimensions` is the dimension of GPU tiles for the render pass.
- `apronDimensions` is the dimension of the tile apron for the render pass.
- `origin` is the coordinates of the top left corner of the first tile in attachment space.

XrTilePropertiesMETA is used to specify the tile properties for a single render pass provided in the XrTilePropertiesHintMETA structure. These values **should** be provided from the `VK_QCOM_tile_properties` extension from `vkGetDynamicRenderingTilePropertiesQCOM` or `vkGetFramebufferTilePropertiesQCOM`.

Valid Usage (Implicit)

- The `XR_META_tile_properties_hint` extension **must** be enabled prior to using XrTilePropertiesMETA
- `type` **must** be `XR_TYPE_TILE_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrExtent3DiMETA structure is defined as:

```
// Provided by XR_META_tile_properties_hint
typedef struct XrExtent3DiMETA {
    int32_t    width;
    int32_t    height;
    int32_t    depth;
} XrExtent3DiMETA;
```

Member Descriptions

- `width` is the width of the extent.
- `height` is the height of the extent.
- `depth` is the depth of the extent.

Valid Usage (Implicit)

- The `XR_META_tile_properties_hint` extension **must** be enabled prior to using XrExtent3DiMETA

12.172.3. Example code

```
XrInstance instance; // previously initialized
XrSession session; // previously initialized
VkDevice device; // previously initialized
VkFramebuffer framebuffer; // previously initialized
PFN_vkGetFramebufferTilePropertiesQCOM vkGetFrameBufferTilePropertiesQCOM; //
previously initialized

// Get function pointer for xrCreateFaceTrackerFB.
PFN_xrSetTilePropertiesHintMETA pfnSetTilePropertiesHintMETA = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrSetTilePropertiesHintMETA",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnSetTilePropertiesHintMETA)));

// Get tile properties from vulkan
uint32_t propertyCount = 0;
vkGetFrameBufferTilePropertiesQCOM(device, framebuffer, &propertyCount, nullptr);

if (propertyCount == 0) {
  return;
}

std::vector<VkTilePropertiesQCOM> qcomProperties(propertyCount);
vkGetFrameBufferTilePropertiesQCOM(device, framebuffer, &propertyCount,
qcomProperties.data());

// Convert VkTilePropertiesQCOM to XrTilePropertiesMETA
std::vector<XrTilePropertiesMETA> xrProperties(propertyCount, {
    .type = XR_TYPE_TILE_PROPERTIES_META,
});
for (uint32_t i = 0; i < propertyCount; ++i) {
  xrProperties[i].type = XR_TYPE_TILE_PROPERTIES_META;
  xrProperties[i].tileDimensions.width = qcomProperties[i].tileSize.width;
  xrProperties[i].tileDimensions.height = qcomProperties[i].tileSize.height;
  xrProperties[i].tileDimensions.depth = qcomProperties[i].tileSize.depth;
  xrProperties[i].apronDimensions.width = qcomProperties[i].apronSize.width;
  xrProperties[i].apronDimensions.height = qcomProperties[i].apronSize.height;
  xrProperties[i].origin.x = qcomProperties[i].origin.x;
  xrProperties[i].origin.y = qcomProperties[i].origin.y;
}

// Send the hint
XrTilePropertiesHintMETA hint{
    .type = XR_TYPE_TILE_PROPERTIES_HINT_META,
    .propertiesCount = propertyCount,
    .properties = xrProperties.data(),
};
CHK_XR(pfnSetTilePropertiesHintMETA(session, &hint));
```

12.172.4. New Commands

12.173.1. Overview

The virtual keyboard extension provides a system-driven localized keyboard that the application has full control over in terms of positioning and rendering.

This is achieved by giving the application the data required to drive rendering and animation of the keyboard in response to interaction data passed from the application to the runtime.

This approach is an alternative to a potential system keyboard overlay solution and provides a keyboard that can seamlessly blend into the application environment, since it is rendered by the same system, and avoids input focus issues that might come with a system overlay.

The API is also designed to work with custom hand and/or controller models in various games and applications.

Virtual Keyboard Integration Summary

Before explaining the individual API functions, types, and events, here is an overview on how to integrate the virtual keyboard in an application.

Note that this is purely informational and does not serve as binding requirements for the runtime or the application.

App Startup

- Check if your device supports the virtual keyboard with xrGetSystemProperties.
- Create a new keyboard with xrCreateVirtualKeyboardMETA.
- Give it a location with xrCreateVirtualKeyboardSpaceMETA, and keep a reference to the returned XrSpace.
- Load the virtual keyboard glTF model using `XR_FB_render_model`:

- Query the render model key for path */model_meta/keyboard/virtual*.
  - Using xrEnumerateRenderModelPathsFB and xrGetRenderModelPropertiesFB.
  - Make sure to set the support level to `XR_RENDER_MODEL_SUPPORTS_GLTF_2_0_SUBSET_2_BIT_FB`.
- Load the render model glTF data with the given key with xrLoadRenderModelFB.
- Load the glTF data into an extendable glTF renderer (see `Extend glTF render model support`). Note that this render model is hidden by default.

Update Tick

- When the application wants to show the keyboard, call xrSetVirtualKeyboardModelVisibilityMETA to request the runtime to update the model visibility.
  - The application **should** wait for the XrEventDataVirtualKeyboardShownMETA event as confirmation that the runtime is ready to show the keyboard.
- The application **can** move the keyboard by calling xrSuggestVirtualKeyboardLocationMETA to update the saved XrSpace.
- Then for every active input type feed the keyboard input with xrSendVirtualKeyboardInputMETA:
  - For each hand/controller, use:
    - `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_*_RAY_*` for far input
    - `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_*_DIRECT_*` for direct/near input
    - If both near and far input types are sent, the runtime **may** decide which one is the most appropriate to use.
  - Passing in a value for the input devices interactorRoot as well, i.e. the wrist root for hands.
  - The runtime will modify the `interactorRootPose` to poke limit direct interaction.
    - If poke limiting is desired, the application **should** reposition input render models with the modified root pose.
- Then get the runtime keyboard pose and scale:
  - Using xrLocateSpace on the saved keyboardSpace.
  - Using xrGetVirtualKeyboardScaleMETA to get the scale.
- Then check if the virtual keyboard glTF model has any textures that need to be updated with xrGetVirtualKeyboardDirtyTexturesMETA.
  - For every dirty texture, call xrGetVirtualKeyboardTextureDataMETA to get the RGBA texture data.
  - And then updating the texture in the glTF model that matches the given texture id.
- Then apply any glTF model animations using xrGetVirtualKeyboardModelAnimationStatesMETA to get updated animation indices and fraction values for each animation.

On Events

- XrEventDataVirtualKeyboardCommitTextMETA / XrEventDataVirtualKeyboardBackspaceMETA / XrEventDataVirtualKeyboardEnterMETA
  - Applications **can** pipe these events to a focused input field, or whatever they are expecting to handle the virtual keyboard's input.
- XrEventDataVirtualKeyboardShownMETA & XrEventDataVirtualKeyboardHiddenMETA
  - Signaled when the virtual keyboard render model animation system is hiding or showing the keyboard.

App Shutdown

- Destroy the keyboard with xrDestroyVirtualKeyboardMETA.

12.173.2. Extend glTF render model support

The virtual keyboard glTF model uses a custom texture URI for textures that the application needs to update dynamically. The application **should** implement a custom URI handler when loading the glTF model to check for these URIs and create writable textures identified by the corresponding texture ids.

The runtime **must** refer to these textures in the returned glTF model by URIs in the following format: `metaVirtualKeyboard://texture/{textureID}?w={width}&h={height}&fmt=RGBA32`

The application **should** retrieve new pixel data from the runtime with xrGetVirtualKeyboardDirtyTexturesMETA and xrGetVirtualKeyboardTextureDataMETA and apply them to the corresponding textures that are used to render the glTF model.

Furthermore, the runtime **may** use additive morph target animations to control vertex coordinates and modify UVs. The application **should** check the "extras" property when loading a glTF animation channel for an integer field named "additiveWeightIndex". If present, this value indicates the morph target index that the animation weight should be applied to, or apply all weights if the value is -1.

The application **should** check for any glTF animations to apply to the model each frame with xrGetVirtualKeyboardModelAnimationStatesMETA.

12.173.3. Collision Handling

Even though the runtime will handle any user interaction with the keyboard based on the input sent by the application, the application is responsible for managing how the keyboard should collide with other objects in the scene. To do this, the application **can** look for a node named "collision" in the loaded glTF model and use its mesh geometry and bound to define colliders that can be used by the application's choice of physics system.

12.173.4. Check device compatibility

When the `XR_META_virtual_keyboard` extension is enabled, an application **can** pass in an XrSystemVirtualKeyboardPropertiesMETA structure in the XrSystemProperties::`next` chain when calling xrGetSystemProperties to acquire information about the virtual keyboard's availability.

The XrSystemVirtualKeyboardPropertiesMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrSystemVirtualKeyboardPropertiesMETA {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsVirtualKeyboard;
} XrSystemVirtualKeyboardPropertiesMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsVirtualKeyboard` is an `XrBool32` indicating if virtual keyboard is supported.

The struct is used for checking virtual keyboard support.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrSystemVirtualKeyboardPropertiesMETA
- `type` **must** be `XR_TYPE_SYSTEM_VIRTUAL_KEYBOARD_PROPERTIES_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.173.5. Create a virtual keyboard

An application **can** create a virtual keyboard by calling xrCreateVirtualKeyboardMETA.

The xrCreateVirtualKeyboardMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrCreateVirtualKeyboardMETA(
    XrSession                                   session,
    const XrVirtualKeyboardCreateInfoMETA*      createInfo,
    XrVirtualKeyboardMETA*                      keyboard);
```

Parameter Descriptions

- `session` is the XrSession.
- `createInfo` is the XrVirtualKeyboardCreateInfoMETA.
- `keyboard` is the returned XrVirtualKeyboardMETA.

xrCreateVirtualKeyboardMETA creates an XrVirtualKeyboardMETA handle and establishes a keyboard within the runtime XrSession. The returned virtual keyboard handle **may** be subsequently used in API calls.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrCreateVirtualKeyboardMETA
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrVirtualKeyboardCreateInfoMETA structure
- `keyboard` **must** be a pointer to an XrVirtualKeyboardMETA handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrVirtualKeyboardCreateInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardCreateInfoMETA {
    XrStructureType    type;
    const void*        next;
} XrVirtualKeyboardCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The struct is used for keyboard creation. Empty with the intention of future extension.

The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if XrSystemVirtualKeyboardPropertiesMETA ::`supportsVirtualKeyboard` is `XR_FALSE` when checking the device compatibility.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardCreateInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.173.6. Destroy the virtual keyboard

An application **can** destroy a virtual keyboard by calling xrDestroyVirtualKeyboardMETA.

The xrDestroyVirtualKeyboardMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrDestroyVirtualKeyboardMETA(
    XrVirtualKeyboardMETA                       keyboard);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle to the keyboard to destroy.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to calling xrDestroyVirtualKeyboardMETA
- keyboard **must** be a valid XrVirtualKeyboardMETA handle

Thread Safety

- Access to keyboard, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.173.7. Place the virtual keyboard

To place the keyboard, an application **can** create a virtual keyboard space by calling xrCreateVirtualKeyboardSpaceMETA.

The xrCreateVirtualKeyboardSpaceMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrCreateVirtualKeyboardSpaceMETA(
    XrSession                                   session,
    XrVirtualKeyboardMETA                       keyboard,
    const XrVirtualKeyboardSpaceCreateInfoMETA* createInfo,
    XrSpace*                                    keyboardSpace);
```

Parameter Descriptions

- `session` is the XrSession.
- `keyboard` is the XrVirtualKeyboardMETA handle.
- `createInfo` is the XrVirtualKeyboardSpaceCreateInfoMETA.
- `keyboardSpace` is the returned space handle.

Creates an XrSpace handle and places the keyboard in this space. The returned space handle **may** be subsequently used in API calls.

Once placed, the application **should** query the keyboard's location each frame using xrLocateSpace. It is important to do this every frame as the runtime is in control of the keyboard's movement.

The runtime **must** return `XR_ERROR_HANDLE_INVALID` if `session` is different than what is used to create `keyboard`.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrCreateVirtualKeyboardSpaceMETA
- `session` **must** be a valid XrSession handle
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `createInfo` **must** be a pointer to a valid XrVirtualKeyboardSpaceCreateInfoMETA structure
- `keyboardSpace` **must** be a pointer to an XrSpace handle
- `keyboard` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrVirtualKeyboardSpaceCreateInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardSpaceCreateInfoMETA {
    XrStructureType                     type;
    const void*                         next;
    XrVirtualKeyboardLocationTypeMETA   locationType;
    XrSpace                             space;
    XrPosef                             poseInSpace;
} XrVirtualKeyboardSpaceCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `locationType` is an XrVirtualKeyboardLocationTypeMETA enum providing the location type.
- `space` is an XrSpace previously created by a function such as xrCreateReferenceSpace.
- `poseInSpace` is the desired pose if `locationType` is `XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META`.

If `locationType` is set to `XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META`, the runtime **must** use the value `poseInSpace` set by the application. Otherwise, the runtime **must** provide a default pose and ignore `poseInSpace`. In all cases, the runtime **must** default the scale to 1.0.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardSpaceCreateInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_SPACE_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `locationType` **must** be a valid XrVirtualKeyboardLocationTypeMETA value
- `space` **must** be a valid XrSpace handle

12.173.8. Move and scale the virtual keyboard

After creating a keyboard and a space, an application **can** request to move its location or change its scale. The application **can** suggest a new location or scale by calling xrSuggestVirtualKeyboardLocationMETA.

The xrSuggestVirtualKeyboardLocationMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrSuggestVirtualKeyboardLocationMETA(
    XrVirtualKeyboardMETA                       keyboard,
    const XrVirtualKeyboardLocationInfoMETA*    locationInfo);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle.
- `locationInfo` is the desired XrVirtualKeyboardLocationInfoMETA.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrSuggestVirtualKeyboardLocationMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `locationInfo` **must** be a pointer to a valid XrVirtualKeyboardLocationInfoMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrVirtualKeyboardLocationInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardLocationInfoMETA {
    XrStructureType                       type;
    const void*                           next;
    XrVirtualKeyboardLocationTypeMETA     locationType;
    XrSpace                               space;
    XrPosef                               poseInSpace;
    float                                 scale;
} XrVirtualKeyboardLocationInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `locationType` is an XrVirtualKeyboardLocationTypeMETA enum providing the location type.
- `space` is an XrSpace previously created by a function such as xrCreateReferenceSpace.
- `poseInSpace` is the desired pose if `locationType` is `XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META`.
- `scale` is a `float` value of the desired multiplicative scale between 0.0 and 1.0 if `locationType` is `XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META`.

If `locationType` is set to `XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META`, the runtime **must** use the values `poseInSpace` and `scale` set by the application. Otherwise, the runtime **must** provide a default pose and scale and ignore `poseInSpace` and `scale`.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardLocationInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_LOCATION_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `locationType` **must** be a valid XrVirtualKeyboardLocationTypeMETA value
- `space` **must** be a valid XrSpace handle

12.173.9. Get the virtual keyboard scale

Since xrLocateSpace only handles the pose, the application **should** also get the scale every frame by

calling xrGetVirtualKeyboardScaleMETA.

The xrGetVirtualKeyboardScaleMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrGetVirtualKeyboardScaleMETA(
    XrVirtualKeyboardMETA                       keyboard,
    float*                                      scale);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle.
- `scale` is a float value of the current scale of the keyboard.

With both the pose and scale, the application has all the information to draw the virtual keyboard render model.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrGetVirtualKeyboardScaleMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `scale` **must** be a pointer to a `float` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.173.10. Show and hide the virtual keyboard

The runtime is in control of the keyboard's visibility to decide when to process input and reset the keyboard states. By default the keyboard render model is hidden. An application **can** update the render model visibility by calling xrSetVirtualKeyboardModelVisibilityMETA.

The xrSetVirtualKeyboardModelVisibilityMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrSetVirtualKeyboardModelVisibilityMETA(
    XrVirtualKeyboardMETA                       keyboard,
    const XrVirtualKeyboardModelVisibilitySetInfoMETA* modelVisibility);
```

Parameter Descriptions

- keyboard is the XrVirtualKeyboardMETA handle.
- modelVisibility is the XrVirtualKeyboardModelVisibilitySetInfoMETA.

Note that the runtime has final control of the model visibility. The runtime **may** also change the visible state in certain situations. To get the actual visibility state of the render model, the application **should** wait for the XrEventDataVirtualKeyboardShownMETA and XrEventDataVirtualKeyboardHiddenMETA events.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to calling xrSetVirtualKeyboardModelVisibilityMETA
- keyboard **must** be a valid XrVirtualKeyboardMETA handle
- modelVisibility **must** be a pointer to a valid XrVirtualKeyboardModelVisibilitySetInfoMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrVirtualKeyboardModelVisibilitySetInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardModelVisibilitySetInfoMETA {
    XrStructureType    type;
    const void*        next;
    XrBool32           visible;
} XrVirtualKeyboardModelVisibilitySetInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `visible` an `XrBool32` that controls whether to show or hide the keyboard.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardModelVisibilitySetInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_MODEL_VISIBILITY_SET_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.173.11. Update render model textures

Each frame update the application **should** check for any textures that are updated by the runtime (e.g. when new swipe suggestion words are available). The application **should** first get the texture IDs that have updated contents (are "dirty") by calling xrGetVirtualKeyboardDirtyTexturesMETA. Then for each texture ID received, the application **should** create a XrVirtualKeyboardTextureDataMETA structure and call xrGetVirtualKeyboardTextureDataMETA to get the pixel data to update the corresponding texture created by the render system using the id reference.

The xrGetVirtualKeyboardDirtyTexturesMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrGetVirtualKeyboardDirtyTexturesMETA(
    XrVirtualKeyboardMETA                       keyboard,
    uint32_t                                    textureIdCapacityInput,
    uint32_t*                                   textureIdCountOutput,
    uint64_t*                                   textureIds);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle.
- `textureIdCapacityInput` is the capacity of the `textureIds` array, or 0 to indicate a request to retrieve the required capacity.
- `textureIdCountOutput` is filled in by the runtime with the count of texture IDs written or the required capacity in the case that `textureIdCapacityInput` is insufficient.
- `textureIds` is the array of texture IDs that need to be updated.

This function follows the two-call idiom for filling the `textureIds` array. Note that new texture data may be added after the runtime processes inputs from xrSendVirtualKeyboardInputMETA. Therefore, after sending new keyboard inputs the application **should** query the buffer size again before getting any texture data.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrGetVirtualKeyboardDirtyTexturesMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `textureIdCountOutput` **must** be a pointer to a `uint32_t` value
- If `textureIdCapacityInput` is not `0`, `textureIds` **must** be a pointer to an array of `textureIdCapacityInput` `uint64_t` values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The xrGetVirtualKeyboardTextureDataMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrGetVirtualKeyboardTextureDataMETA(
    XrVirtualKeyboardMETA                       keyboard,
    uint64_t                                    textureId,
    XrVirtualKeyboardTextureDataMETA*           textureData);
```

Parameter Descriptions

- keyboard is the XrVirtualKeyboardMETA handle.
- textureId is the ID of the texture that the application is querying data for.
- textureData is the returned XrVirtualKeyboardTextureDataMETA.

This function follows the two-call idiom for filling the textureData array in the XrVirtualKeyboardTextureDataMETA structure. Note that new texture data may be added after the runtime processes inputs from xrSendVirtualKeyboardInputMETA. Therefore, after sending new keyboard inputs the application **should** query the buffer size again before getting any texture data.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to calling xrGetVirtualKeyboardTextureDataMETA
- keyboard **must** be a valid XrVirtualKeyboardMETA handle
- textureData **must** be a pointer to an XrVirtualKeyboardTextureDataMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The XrVirtualKeyboardTextureDataMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardTextureDataMETA {
    XrStructureType    type;
    void*              next;
    uint32_t           textureWidth;
    uint32_t           textureHeight;
    uint32_t           bufferCapacityInput;
    uint32_t           bufferCountOutput;
    uint8_t*           buffer;
} XrVirtualKeyboardTextureDataMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `textureWidth` is the pixel width of the texture to be updated.
- `textureHeight` is the pixel height of the texture to be updated.
- `bufferCapacityInput` is the capacity of `buffer`, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` is filled in by the runtime with the byte count written or the required capacity in the case that `bufferCapacityInput` is insufficient.
- `buffer` is the pixel data in linear color space, RGBA 8-bit unsigned normalized integer format (i.e. GL_RGBA8 in OpenGL, VK_FORMAT_R8G8B8A8_UNORM in Vulkan).

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardTextureDataMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_TEXTURE_DATA_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` `uint8_t` values

12.173.12. Update render model animations

Besides checking for texture updates, each frame the application **should** also check for any animations to be applied to the render model. The runtime **may** use these animations to control the visibility of different keys, layout changes, and even modify key sizes and texture coordinates via morph targets. The application **can** get the animation states to be applied by calling xrGetVirtualKeyboardModelAnimationStatesMETA. This will return an array of XrVirtualKeyboardAnimationStateMETA which the application **should** apply to the render model, indexed by the GLTF animation array index order.

The xrGetVirtualKeyboardModelAnimationStatesMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrGetVirtualKeyboardModelAnimationStatesMETA(
    XrVirtualKeyboardMETA                       keyboard,
    XrVirtualKeyboardModelAnimationStatesMETA*  animationStates);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle.
- `animationStates` is the XrVirtualKeyboardModelAnimationStatesMETA.

This function follows the two-call idiom for filling the `animationStates` array in the XrVirtualKeyboardModelAnimationStatesMETA structure. Note that new animations may be added after the runtime processes inputs from xrSendVirtualKeyboardInputMETA. Therefore, after sending new keyboard inputs the application **should** query the buffer size again before getting any animation data.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrGetVirtualKeyboardModelAnimationStatesMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `animationStates` **must** be a pointer to an XrVirtualKeyboardModelAnimationStatesMETA structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The XrVirtualKeyboardAnimationStateMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardAnimationStateMETA {
    XrStructureType    type;
    void*              next;
    int32_t            animationIndex;
    float              fraction;
} XrVirtualKeyboardAnimationStateMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- animationIndex is the index of the animation to use for the render model.
- fraction is the normalized value between the start and end time of the animation.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to using XrVirtualKeyboardAnimationStateMETA
- type **must** be XR_TYPE_VIRTUAL_KEYBOARD_ANIMATION_STATE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrVirtualKeyboardModelAnimationStatesMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardModelAnimationStatesMETA {
    XrStructureType                           type;
    void*                                     next;
    uint32_t                                  stateCapacityInput;
    uint32_t                                  stateCountOutput;
    XrVirtualKeyboardAnimationStateMETA*      states;
} XrVirtualKeyboardModelAnimationStatesMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- stateCapacityInput is the capacity of the states array, or 0 to indicate a request to retrieve the required capacity.
- stateCountOutput is filled in by the runtime with the count of XrVirtualKeyboardAnimationStateMETA written or the required capacity in the case that stateCapacityInput is insufficient.
- states is the array of XrVirtualKeyboardAnimationStateMETA to apply to the model.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to using XrVirtualKeyboardModelAnimationStatesMETA
- type **must** be XR_TYPE_VIRTUAL_KEYBOARD_MODEL_ANIMATION_STATES_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If stateCapacityInput is not 0, states **must** be a pointer to an array of stateCapacityInput XrVirtualKeyboardAnimationStateMETA structures

12.173.13. Send user input and text context

Since the application has control over how collision should be handled between the keyboard and other objects in the scene, it is up to the application to decide when to send input to the virtual keyboard. Per frame, for every input source the application wants to be applied to the keyboard, the application **should** create a XrVirtualKeyboardInputInfoMETA and call xrSendVirtualKeyboardInputMETA while also supplying the root pose of the interaction source.

The runtime **may** modify with an offset the given interactorRootPose if the given input is puncturing the keyboard. This is to give the effect that the virtual object cannot push through the keyboard and improves keyboard input perception. This is sometimes referred to as poke limiting.

To aid features like auto complete or whole word deletion, before sending input applications **should** populate a XrVirtualKeyboardTextContextChangeInfoMETA structure and call xrChangeVirtualKeyboardTextContextMETA to supply the runtime with the application's text context prior to the input cursor.

The xrSendVirtualKeyboardInputMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrSendVirtualKeyboardInputMETA(
    XrVirtualKeyboardMETA                       keyboard,
    const XrVirtualKeyboardInputInfoMETA*       info,
    XrPosef*                                    interactorRootPose);
```

Parameter Descriptions

- keyboard is the XrVirtualKeyboardMETA handle.
- info is the XrVirtualKeyboardInputInfoMETA detailing the input being sent to the runtime.
- interactorRootPose is an XrPosef defining the root pose of the input source. The runtime **may** modify this value to aid keyboard input perception.

The application **can** use values like a pointer pose as the `interactorRootPose` for `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_RAY_*` or `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_RAY_*` input sources, a point on a controller model for `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_DIRECT_*` input sources and the hand index tip pose for `XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_DIRECT_INDEX_TIP_*`. Different input poses can be used to accommodate application specific controller or hand models.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrSendVirtualKeyboardInputMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `info` **must** be a pointer to a valid XrVirtualKeyboardInputInfoMETA structure
- `interactorRootPose` **must** be a pointer to an XrPosef structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrVirtualKeyboardInputInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardInputInfoMETA {
    XrStructureType                           type;
    const void*                               next;
    XrVirtualKeyboardInputSourceMETA          inputSource;
    XrSpace                                   inputSpace;
    XrPosef                                   inputPoseInSpace;
    XrVirtualKeyboardInputStateFlagsMETA      inputState;
} XrVirtualKeyboardInputInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `inputSource` is an enum of XrVirtualKeyboardInputSourceMETA describing the source device and input mode type.
- `inputSpace` is an XrSpace previously created by a function such as xrCreateReferenceSpace.
- `inputPoseInSpace` is an XrPosef defining the position and orientation of the input's source pose within the natural reference frame of the input space.
- `inputState` is a bitmask of XrVirtualKeyboardInputStateFlagsMETA describing the button or pinch state of the `inputSource`.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardInputInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_INPUT_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `inputSource` **must** be a valid XrVirtualKeyboardInputSourceMETA value
- If `inputSpace` is not XR_NULL_HANDLE, `inputSpace` **must** be a valid XrSpace handle
- `inputState` **must** be `0` or a valid combination of XrVirtualKeyboardInputStateFlagBitsMETA values

The xrChangeVirtualKeyboardTextContextMETA function is defined as:

```
// Provided by XR_META_virtual_keyboard
XrResult xrChangeVirtualKeyboardTextContextMETA(
    XrVirtualKeyboardMETA                       keyboard,
    const XrVirtualKeyboardTextContextChangeInfoMETA* changeInfo);
```

Parameter Descriptions

- `keyboard` is the XrVirtualKeyboardMETA handle.
- `changeInfo` is the XrVirtualKeyboardTextContextChangeInfoMETA detailing prior input text context to the runtime.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to calling xrChangeVirtualKeyboardTextContextMETA
- `keyboard` **must** be a valid XrVirtualKeyboardMETA handle
- `changeInfo` **must** be a pointer to a valid XrVirtualKeyboardTextContextChangeInfoMETA structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrVirtualKeyboardTextContextChangeInfoMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrVirtualKeyboardTextContextChangeInfoMETA {
    XrStructureType    type;
    const void*        next;
    const char*        textContext;
} XrVirtualKeyboardTextContextChangeInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `textContext` is a pointer to a `char` buffer, should contain prior input text context terminated with a null character.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrVirtualKeyboardTextContextChangeInfoMETA
- `type` **must** be `XR_TYPE_VIRTUAL_KEYBOARD_TEXT_CONTEXT_CHANGE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `textContext` **must** be a null-terminated UTF-8 string

12.173.14. Handling events

Each frame the application **should** listen for the following events sent by the runtime that reflects the state of the keyboard.

The XrEventDataVirtualKeyboardCommitTextMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrEventDataVirtualKeyboardCommitTextMETA {
    XrStructureType          type;
    const void*              next;
    XrVirtualKeyboardMETA    keyboard;
    char                     text[XR_MAX_VIRTUAL_KEYBOARD_COMMIT_TEXT_SIZE_META];
} XrEventDataVirtualKeyboardCommitTextMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `keyboard` is the XrVirtualKeyboardMETA this event belongs to.
- `text` is the text string input by the keyboard.

The XrEventDataVirtualKeyboardCommitTextMETA event **must** be sent by the runtime when a character or string is input by the keyboard. The application **should** append to the text field that the keyboard is editing.

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrEventDataVirtualKeyboardCommitTextMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_COMMIT_TEXT_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataVirtualKeyboardBackspaceMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrEventDataVirtualKeyboardBackspaceMETA {
    XrStructureType          type;
    const void*              next;
    XrVirtualKeyboardMETA    keyboard;
} XrEventDataVirtualKeyboardBackspaceMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `keyboard` is the XrVirtualKeyboardMETA this event belongs to.

The XrEventDataVirtualKeyboardBackspaceMETA event **must** be sent by the runtime when the [Backspace] key is pressed. The application **should** update the text field that the keyboard is editing.

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to using XrEventDataVirtualKeyboardBackspaceMETA
- type **must** be XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_BACKSPACE_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataVirtualKeyboardEnterMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrEventDataVirtualKeyboardEnterMETA {
    XrStructureType          type;
    const void*              next;
    XrVirtualKeyboardMETA    keyboard;
} XrEventDataVirtualKeyboardEnterMETA;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- keyboard is the XrVirtualKeyboardMETA this event belongs to.

The XrEventDataVirtualKeyboardEnterMETA event **must** be sent by the runtime when the [Enter] key is pressed. The application **should** respond accordingly (e.g. newline, accept, etc).

Valid Usage (Implicit)

- The XR_META_virtual_keyboard extension **must** be enabled prior to using XrEventDataVirtualKeyboardEnterMETA
- type **must** be XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_ENTER_META
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataVirtualKeyboardShownMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrEventDataVirtualKeyboardShownMETA {
    XrStructureType          type;
    const void*              next;
    XrVirtualKeyboardMETA    keyboard;
} XrEventDataVirtualKeyboardShownMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `keyboard` is the XrVirtualKeyboardMETA this event belongs to.

The XrEventDataVirtualKeyboardShownMETA event **must** be sent when the runtime has shown the keyboard render model (via animation). The application **should** update its state accordingly (e.g. update UI, pause simulation, etc).

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrEventDataVirtualKeyboardShownMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_SHOWN_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrEventDataVirtualKeyboardHiddenMETA structure is defined as:

```
// Provided by XR_META_virtual_keyboard
typedef struct XrEventDataVirtualKeyboardHiddenMETA {
    XrStructureType          type;
    const void*              next;
    XrVirtualKeyboardMETA    keyboard;
} XrEventDataVirtualKeyboardHiddenMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `keyboard` is the XrVirtualKeyboardMETA this event belongs to.

The XrEventDataVirtualKeyboardHiddenMETA event **must** be sent when the keyboard render model is hidden by the runtime (via animation). The application **should** update its state accordingly (e.g. update UI, resume simulation, etc).

Valid Usage (Implicit)

- The `XR_META_virtual_keyboard` extension **must** be enabled prior to using XrEventDataVirtualKeyboardHiddenMETA
- `type` **must** be `XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_HIDDEN_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.173.15. Example code for using virtual keyboard

The following example code demonstrates how to create and use the virtual keyboard.

```
XrInstance instance;  // previously initialized
XrSystemId system;    // previously initialized
XrSession session;    // previously initialized
XrSpace localSpace;   // previously initialized
XrPosef poseIdentity; // previously initialized

// XR_FB_render_model API previously initialized with xrGetInstanceProcAddr
PFN_xrEnumerateRenderModelPathsFB xrEnumerateRenderModelPathsFB = nullptr;
PFN_xrGetRenderModelPropertiesFB xrGetRenderModelPropertiesFB = nullptr;
PFN_xrLoadRenderModelFB xrLoadRenderModelFB = nullptr;

// XR_META_virtual_keyboard API previously initialized with xrGetInstanceProcAddr
PFN_xrCreateVirtualKeyboardMETA xrCreateVirtualKeyboardMETA = nullptr;
PFN_xrDestroyVirtualKeyboardMETA xrDestroyVirtualKeyboardMETA = nullptr;
PFN_xrCreateVirtualKeyboardSpaceMETA xrCreateVirtualKeyboardSpaceMETA = nullptr;
PFN_xrSuggestVirtualKeyboardLocationMETA xrSuggestVirtualKeyboardLocationMETA = nullptr;
PFN_xrGetVirtualKeyboardScaleMETA xrGetVirtualKeyboardScaleMETA = nullptr;
PFN_xrSetVirtualKeyboardModelVisibilityMETA xrSetVirtualKeyboardModelVisibilityMETA =
nullptr;
PFN_xrGetVirtualKeyboardModelAnimationStatesMETA
```

```
xrGetVirtualKeyboardModelAnimationStatesMETA = nullptr;
PFN_xrGetVirtualKeyboardDirtyTexturesMETA xrGetVirtualKeyboardDirtyTexturesMETA =

```

New Object Types

```
// Provided by XR_META_virtual_keyboard
XR_DEFINE_HANDLE(XrVirtualKeyboardMETA)
```

XrVirtualKeyboardMETA represents a virtual keyboard instance.

New Flag Types

```
// Provided by XR_META_virtual_keyboard
typedef XrFlags64 XrVirtualKeyboardInputStateFlagsMETA;
```

```
// Provided by XR_META_virtual_keyboard
// Flag bits for XrVirtualKeyboardInputStateFlagsMETA
static const XrVirtualKeyboardInputStateFlagsMETA
XR_VIRTUAL_KEYBOARD_INPUT_STATE_PRESSED_BIT_META = 0x00000001;
```

Flag Descriptions

- XR_VIRTUAL_KEYBOARD_INPUT_STATE_PRESSED_BIT_META — If the input source is considered 'pressed' at all. Pinch for hands, Primary button for controllers.

New Enum Constants

- XR_MAX_VIRTUAL_KEYBOARD_COMMIT_TEXT_SIZE_META

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_VIRTUAL_KEYBOARD_PROPERTIES_META
- XR_TYPE_VIRTUAL_KEYBOARD_CREATE_INFO_META
- XR_TYPE_VIRTUAL_KEYBOARD_SPACE_CREATE_INFO_META
- XR_TYPE_VIRTUAL_KEYBOARD_LOCATION_INFO_META
- XR_TYPE_VIRTUAL_KEYBOARD_MODEL_VISIBILITY_SET_INFO_META
- XR_TYPE_VIRTUAL_KEYBOARD_ANIMATION_STATE_META
- XR_TYPE_VIRTUAL_KEYBOARD_MODEL_ANIMATION_STATES_META
- XR_TYPE_VIRTUAL_KEYBOARD_TEXTURE_DATA_META
- XR_TYPE_VIRTUAL_KEYBOARD_INPUT_INFO_META
- XR_TYPE_VIRTUAL_KEYBOARD_TEXT_CONTEXT_CHANGE_INFO_META
- XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_COMMIT_TEXT_META
- XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_BACKSPACE_META
- XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_ENTER_META
- XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_SHOWN_META
- XR_TYPE_EVENT_DATA_VIRTUAL_KEYBOARD_HIDDEN_META

New Defines

New Enums

The possible location types are specified by the XrVirtualKeyboardLocationTypeMETA enumeration:

```
// Provided by XR_META_virtual_keyboard
typedef enum XrVirtualKeyboardLocationTypeMETA {
    XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META = 0,
    XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_FAR_META = 1,
    XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_DIRECT_META = 2,
    XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_MAX_ENUM_META = 0x7FFFFFFF
} XrVirtualKeyboardLocationTypeMETA;
```

Enumerant Descriptions

- XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_CUSTOM_META
  Indicates that the application will provide the position and scale of the keyboard.
- XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_FAR_META
  Indicates that the runtime will set the position and scale for far field keyboard.
- XR_VIRTUAL_KEYBOARD_LOCATION_TYPE_DIRECT_META
  Indicates that the runtime will set the position and scale for direct interaction keyboard.

The possible input sources are specified by the XrVirtualKeyboardInputSourceMETA enumeration:

```
// Provided by XR_META_virtual_keyboard
typedef enum XrVirtualKeyboardInputSourceMETA {
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_RAY_LEFT_META = 1,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_RAY_RIGHT_META = 2,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_RAY_LEFT_META = 3,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_RAY_RIGHT_META = 4,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_DIRECT_LEFT_META = 5,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_DIRECT_RIGHT_META = 6,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_DIRECT_INDEX_TIP_LEFT_META = 7,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_DIRECT_INDEX_TIP_RIGHT_META = 8,
    XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_MAX_ENUM_META = 0x7FFFFFFF
} XrVirtualKeyboardInputSourceMETA;
```

Enum	Description
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_RAY_LEFT_META	Left controller ray.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_RAY_RIGHT_META	Right controller ray.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_RAY_LEFT_META	Left hand ray.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_RAY_RIGHT_META	Right hand ray.

Enum	Description
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_DIRECT_LEFT_META	Left controller direct touch.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_CONTROLLER_DIRECT_RIGHT_META	Right controller direct touch.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_DIRECT_INDEX_TIP_LEFT_META	Left hand direct touch.
XR_VIRTUAL_KEYBOARD_INPUT_SOURCE_HAND_DIRECT_INDEX_TIP_RIGHT_META	Right hand direct touch.

Overview

Using this extension, a Vulkan-based application **can** pass through additional VkImageCreateFlags or VkImageUsageFlags by chaining an XrVulkanSwapchainCreateInfoMETA structure to the XrSwapchainCreateInfo when calling xrCreateSwapchain.

The application is still encouraged to use the common bits like XR_SWAPCHAIN_USAGE_TRANSFER_SRC_BIT defined in XrSwapchainUsageFlags. However, the application **may** present both XR_SWAPCHAIN_USAGE_TRANSFER_SRC_BIT in XrSwapchainUsageFlags and VK_IMAGE_USAGE_TRANSFER_SRC_BIT in VkImageUsageFlags at the same time.

The application **must** enable the corresponding Vulkan extensions before requesting additional Vulkan flags. For example, VK_EXT_fragment_density_map device extension **must** be enabled if an application requests VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT bit. Otherwise, it **may** cause undefined behavior, including an application crash.

Runtimes that implement this extension **must** support the XR_KHR_vulkan_enable or the XR_KHR_vulkan_enable2 extension.

New Object Types

New Flag Types

New Enum Constants

New Enums

New Structures

```
// Provided by XR_META_vulkan_swapchain_create_info
typedef struct XrVulkanSwapchainCreateInfoMETA {
    XrStructureType       type;
    const void*           next;
    VkImageCreateFlags    additionalCreateFlags;
    VkImageUsageFlags     additionalUsageFlags;
} XrVulkanSwapchainCreateInfoMETA;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `additionalCreateFlags` is a bitmask of `VkImageCreateFlags` describing additional parameters of an image.
- `additionalUsageFlags` is a bitmask of `VkImageUsageFlags` describing additional parameters of an image.

The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if any bit of either `additionalCreateFlags` or `additionalUsageFlags` is not supported.

Valid Usage (Implicit)

- The `XR_META_vulkan_swapchain_create_info` extension **must** be enabled prior to using XrVulkanSwapchainCreateInfoMETA
- `type` **must** be `XR_TYPE_VULKAN_SWAPCHAIN_CREATE_INFO_META`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `additionalCreateFlags` **must** be a valid `VkImageCreateFlags` value
- `additionalUsageFlags` **must** be a valid `VkImageUsageFlags` value

Overview

This extension provides functionality to facilitate transitioning from Magic Leap SDK to OpenXR SDK, most notably interoperability between Coordinate Frame UUIDs and XrSpace.

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_COORDINATE_SPACE_CREATE_INFO_ML`

New Structures

The XrCoordinateSpaceCreateInfoML structure is defined as:

```
// Provided by XR_ML_compat
typedef struct XrCoordinateSpaceCreateInfoML {
    XrStructureType         type;
    const void*             next;
    MLCoordinateFrameUID    cfuid;
    XrPosef                 poseInCoordinateSpace;
} XrCoordinateSpaceCreateInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `cfuid` is the `MLCoordinateFrameUID` as generated by the non-OpenXR API in the Magic Leap SDK.
- `poseInCoordinateSpace` is an XrPosef defining the position and orientation of the new space's origin within the natural reference frame of the `cfuid`.

XrCoordinateSpaceCreateInfoML is provided as input when calling xrCreateSpaceFromCoordinateFrameUIDML to convert a Magic Leap SDK generated `MLCoordinateFrameUID` to an XrSpace. The conversion only needs to be done once even if the underlying `MLCoordinateFrameUID` changes its pose.

Valid Usage (Implicit)

- The `XR_ML_compat` extension **must** be enabled prior to using XrCoordinateSpaceCreateInfoML
- `type` **must** be `XR_TYPE_COORDINATE_SPACE_CREATE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `cfuid` **must** be a valid `MLCoordinateFrameUID` value

New Functions

The xrCreateSpaceFromCoordinateFrameUIDML function is defined as:

```
// Provided by XR_ML_compat
XrResult xrCreateSpaceFromCoordinateFrameUIDML(
    XrSession                                   session,
    const XrCoordinateSpaceCreateInfoML *       createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `createInfo` is the XrCoordinateSpaceCreateInfoML used to specify the space.
- `space` is the returned space handle.

The service that created the underlying XrCoordinateSpaceCreateInfoML::`cfuid` **must** remain active for

the lifetime of the XrSpace. If xrLocateSpace is called on a space created from an XrCoordinateSpaceCreateInfoML::cfuid from a no-longer-active service, the runtime **may** set XrSpaceLocation::locationFlags to 0.

XrSpace handles are destroyed using xrDestroySpace.

Valid Usage (Implicit)

- The XR_ML_compat extension **must** be enabled prior to calling xrCreateSpaceFromCoordinateFrameUIDML
- session **must** be a valid XrSession handle
- createInfo **must** be a pointer to a valid XrCoordinateSpaceCreateInfoML structure
- space **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

Johannes Fung, Magic Leap

12.176.1. Overview

This extension provides the weights of facial blend shapes usable for a variety of purposes, such as mood monitoring or interpolating the expression of an avatar's face.

Permissions

Android applications **must** have the com.magicleap.permission.FACIAL_EXPRESSION permission listed in their manifest and granted to use this extension, otherwise xrCreateFacialExpressionClientML will return a `XR_ERROR_FACIAL_EXPRESSION_PERMISSION_DENIED_ML` error. (protection level: dangerous)

12.176.2. Inspect system capability

The XrSystemFacialExpressionPropertiesML structure is defined as:

```
// Provided by XR_ML_facial_expression
typedef struct XrSystemFacialExpressionPropertiesML {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsFacialExpression;
} XrSystemFacialExpressionPropertiesML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsFacialExpression` is an `XrBool32`, indicating if current system is capable of parsing facial expressions enumerated in XrFacialBlendShapeML

An application **can** inspect whether the system is capable of parsing facial blend shapes by extending the XrSystemProperties with XrSystemFacialExpressionPropertiesML structure when calling xrGetSystemProperties.

If a runtime returns `XR_FALSE` for `supportsFacialExpression`, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFacialExpressionClientML.

Valid Usage (Implicit)

- The `XR_ML_facial_expression` extension **must** be enabled prior to using XrSystemFacialExpressionPropertiesML
- `type` **must** be `XR_TYPE_SYSTEM_FACIAL_EXPRESSION_PROPERTIES_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.176.3. Create a facial expression client handle

The XrFacialExpressionClientML handle represents the resources for parsing facial expressions.

```
// Provided by XR_ML_facial_expression
XR_DEFINE_HANDLE(XrFacialExpressionClientML)
```

This handle is used to obtain blend shapes using the xrGetFacialExpressionBlendShapePropertiesML function.

The xrCreateFacialExpressionClientML function is defined as:

```
// Provided by XR_ML_facial_expression
XrResult xrCreateFacialExpressionClientML(
    XrSession                                   session,
    const XrFacialExpressionClientCreateInfoML* createInfo,
    XrFacialExpressionClientML*                 facialExpressionClient);
```

Parameter Descriptions

- `session` is an XrSession in which the facial expression client will be active.
- `createInfo` is a pointer to the XrFacialExpressionClientCreateInfoML used to specify the facial expression client.
- `facialExpressionClient` is a pointer to the returned XrFacialExpressionClientML handle.

An application **can** create an XrFacialExpressionClientML handle using xrCreateFacialExpressionClientML function.

If the system does not support parsing facial expressions, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateFacialExpressionClientML. In this case, the runtime **must** also return `XR_FALSE` for XrSystemFacialExpressionPropertiesML::`supportsFacialExpression` when the function xrGetSystemProperties is called.

Valid Usage (Implicit)

- The `XR_ML_facial_expression` extension **must** be enabled prior to calling xrCreateFacialExpressionClientML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrFacialExpressionClientCreateInfoML structure
- `facialExpressionClient` **must** be a pointer to an XrFacialExpressionClientML handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FACIAL_EXPRESSION_PERMISSION_DENIED_ML
- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrFacialExpressionClientCreateInfoML structure is defined as follows:

```
// Provided by XR_ML_facial_expression
typedef struct XrFacialExpressionClientCreateInfoML {
    XrStructureType                type;
    const void*                    next;
    uint32_t                       requestedCount;
    const XrFacialBlendShapeML*    requestedFacialBlendShapes;
} XrFacialExpressionClientCreateInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- requestedCount is the size of the requestedFacialBlendShapes array
- requestedFacialBlendShapes is a pointer to an application defined array containing the blend shapes for the runtime to target.

Note that although the naming convention for `requestedCount` does not align with `requestedFacialBlendShapes`, they are coupled together.

The XrFacialExpressionClientCreateInfoML structure describes the information to create an XrFacialExpressionClientML handle.

An application specifies the blend shapes they want to query by creating an array of type XrFacialBlendShapeML and passing it to `requestedFacialBlendShapes` along with the corresponding `requestedCount`.

The application **can** also pass in `NULL` into `requestedFacialBlendShapes` to capture the entirety of XrFacialBlendShapeML. However, for performance reasons, it **may** be better to be explicit about what blend shapes to query for performance reasons since some blend shapes **may** be queried by the runtime at a greater frequency than other blend shapes.

Valid Usage (Implicit)

- The `XR_ML_facial_expression` extension **must** be enabled prior to using XrFacialExpressionClientCreateInfoML
- `type` **must** be `XR_TYPE_FACIAL_EXPRESSION_CLIENT_CREATE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `requestedCount` is not `0`, `requestedFacialBlendShapes` **must** be a pointer to an array of `requestedCount` valid XrFacialBlendShapeML values

12.176.4. Destroy a facial expression client handle

The xrDestroyFacialExpressionClientML function is defined as:

```
// Provided by XR_ML_facial_expression
XrResult xrDestroyFacialExpressionClientML(
    XrFacialExpressionClientML                  facialExpressionClient);
```

Parameter Descriptions

- `facialExpressionClient` is an XrFacialExpressionClientML previously created by xrCreateFacialExpressionClientML.

The xrDestroyFacialExpressionClientML function releases the `facialExpressionClient` and the underlying resources.

Valid Usage (Implicit)

- The XR_ML_facial_expression extension **must** be enabled prior to calling xrDestroyFacialExpressionClientML
- facialExpressionClient **must** be a valid XrFacialExpressionClientML handle

Thread Safety

- Access to facialExpressionClient, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.176.5. Obtain facial expression blend shapes

The xrGetFacialExpressionBlendShapePropertiesML function is defined as:

```
// Provided by XR_ML_facial_expression
XrResult xrGetFacialExpressionBlendShapePropertiesML(
    XrFacialExpressionClientML                  facialExpressionClient,
    const XrFacialExpressionBlendShapeGetInfoML* blendShapeGetInfo,
    uint32_t                                    blendShapeCount,
    XrFacialExpressionBlendShapePropertiesML*   blendShapes);
```

Parameter Descriptions

- `facialExpressionClient` is an XrFacialExpressionClientML previously created by xrCreateFacialExpressionClientML.
- `blendShapeGetInfo` is a pointer to XrFacialExpressionBlendShapeGetInfoML describing information to obtain facial expression.
- `blendShapeCount` is a `uint32_t` specifying the size of the `blendShapes` array.
- `blendShapes` is an application allocated array of XrFacialExpressionBlendShapePropertiesML that contains the blend shapes information. This array acts as both input and output for this function. The array **may** be a subset of blend shapes.

XrFacialExpressionBlendShapePropertiesML is better thought of as a mutable state rather than an immutable property. In general, OpenXR convention tries to keep property data types to be immutable.

The xrGetFacialExpressionBlendShapePropertiesML function returns the XrFacialExpressionBlendShapePropertiesML of each blend shape requested in XrFacialExpressionClientCreateInfoML

Each XrFacialExpressionBlendShapePropertiesML in `blendShapes` **must** have its `requestedFacialBlendShape` member variable initialized before being passed into xrGetFacialExpressionBlendShapePropertiesML.

If a blend shape in `blendShapes` is not enabled in xrCreateFacialExpressionClientML, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

For unsupported blend shapes, the runtime **must** clear XrFacialExpressionBlendShapePropertiesML ::`flags` and the runtime **must** also return `XR_SUCCESS`.

Valid Usage (Implicit)

- The `XR_ML_facial_expression` extension **must** be enabled prior to calling xrGetFacialExpressionBlendShapePropertiesML
- `facialExpressionClient` **must** be a valid XrFacialExpressionClientML handle
- `blendShapeGetInfo` **must** be a pointer to a valid XrFacialExpressionBlendShapeGetInfoML structure
- `blendShapes` **must** be a pointer to an array of `blendShapeCount` XrFacialExpressionBlendShapePropertiesML structures
- The `blendShapeCount` parameter **must** be greater than `0`

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrFacialExpressionBlendShapeGetInfoML structure is defined as:

```
// Provided by XR_ML_facial_expression
typedef struct XrFacialExpressionBlendShapeGetInfoML {
    XrStructureType    type;
    const void*        next;
} XrFacialExpressionBlendShapeGetInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrFacialExpressionBlendShapeGetInfoML structure specifies properties about blend shapes desired by an application. It **must** be passed into xrGetFacialExpressionBlendShapePropertiesML and is currently empty for future extensibility.

Valid Usage (Implicit)

- The XR_ML_facial_expression extension **must** be enabled prior to using XrFacialExpressionBlendShapeGetInfoML
- type **must** be XR_TYPE_FACIAL_EXPRESSION_BLEND_SHAPE_GET_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrFacialExpressionBlendShapePropertiesML structure is defined as:

```
// Provided by XR_ML_facial_expression
typedef struct XrFacialExpressionBlendShapePropertiesML {
    XrStructureType                                 type;
    void*                                           next;
    XrFacialBlendShapeML                            requestedFacialBlendShape;
    float                                           weight;
    XrFacialExpressionBlendShapePropertiesFlagsML   flags;
    XrTime                                          time;
} XrFacialExpressionBlendShapePropertiesML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- requestedFacialBlendShape is the type of XrFacialBlendShapeML to query the runtime for.
- weight is a float describing the weight of a facial expression's blend shape.
- flags is an XrFacialExpressionBlendShapePropertiesFlagsML whose bits are specified in XrFacialExpressionBlendShapePropertiesFlagBitsML
- time is the XrTime that corresponds to the moment at which the requestedFacialBlendShape is captured.

XrFacialExpressionBlendShapePropertiesML structure holds the facial expression.

If requestedFacialBlendShape does not correspond to any XrFacialBlendShapeML passed into xrCreateFacialExpressionClientML then the XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_VALID_BIT_ML and XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_TRACKED_BIT_ML of flags **must** be unset. If the requestedFacialBlendShape is not available at sample time time then XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_TRACKED_BIT_ML **must** be set to false.

The runtime **must** populate weight with the weight of the queried blend shape.

Valid Usage (Implicit)

- The XR_ML_facial_expression extension **must** be enabled prior to using XrFacialExpressionBlendShapePropertiesML
- type **must** be XR_TYPE_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- requestedFacialBlendShape **must** be a valid XrFacialBlendShapeML value

12.176.6. Conventions of blend shapes

This extension defines the following blend shapes for tracking facial expressions.

```
// Provided by XR_ML_facial_expression
typedef enum XrFacialBlendShapeML {
    XR_FACIAL_BLEND_SHAPE_BROW_LOWERER_L_ML = 0,
    XR_FACIAL_BLEND_SHAPE_BROW_LOWERER_R_ML = 1,
    XR_FACIAL_BLEND_SHAPE_CHEEK_RAISER_L_ML = 2,
    XR_FACIAL_BLEND_SHAPE_CHEEK_RAISER_R_ML = 3,
    XR_FACIAL_BLEND_SHAPE_CHIN_RAISER_ML = 4,
    XR_FACIAL_BLEND_SHAPE_DIMPLER_L_ML = 5,
    XR_FACIAL_BLEND_SHAPE_DIMPLER_R_ML = 6,
    XR_FACIAL_BLEND_SHAPE_EYES_CLOSED_L_ML = 7,
    XR_FACIAL_BLEND_SHAPE_EYES_CLOSED_R_ML = 8,
    XR_FACIAL_BLEND_SHAPE_INNER_BROW_RAISER_L_ML = 9,
    XR_FACIAL_BLEND_SHAPE_INNER_BROW_RAISER_R_ML = 10,
    XR_FACIAL_BLEND_SHAPE_JAW_DROP_ML = 11,
    XR_FACIAL_BLEND_SHAPE_LID_TIGHTENER_L_ML = 12,
    XR_FACIAL_BLEND_SHAPE_LID_TIGHTENER_R_ML = 13,
    XR_FACIAL_BLEND_SHAPE_LIP_CORNER_DEPRESSOR_L_ML = 14,
    XR_FACIAL_BLEND_SHAPE_LIP_CORNER_DEPRESSOR_R_ML = 15,
    XR_FACIAL_BLEND_SHAPE_LIP_CORNER_PULLER_L_ML = 16,
    XR_FACIAL_BLEND_SHAPE_LIP_CORNER_PULLER_R_ML = 17,
    XR_FACIAL_BLEND_SHAPE_LIP_FUNNELER_LB_ML = 18,
    XR_FACIAL_BLEND_SHAPE_LIP_FUNNELER_LT_ML = 19,
    XR_FACIAL_BLEND_SHAPE_LIP_FUNNELER_RB_ML = 20,
    XR_FACIAL_BLEND_SHAPE_LIP_FUNNELER_RT_ML = 21,
    XR_FACIAL_BLEND_SHAPE_LIP_PRESSOR_L_ML = 22,
    XR_FACIAL_BLEND_SHAPE_LIP_PRESSOR_R_ML = 23,
    XR_FACIAL_BLEND_SHAPE_LIP_PUCKER_L_ML = 24,
    XR_FACIAL_BLEND_SHAPE_LIP_PUCKER_R_ML = 25,
    XR_FACIAL_BLEND_SHAPE_LIP_STRETCHER_L_ML = 26,
    XR_FACIAL_BLEND_SHAPE_LIP_STRETCHER_R_ML = 27,
    XR_FACIAL_BLEND_SHAPE_LIP_SUCK_LB_ML = 28,
    XR_FACIAL_BLEND_SHAPE_LIP_SUCK_LT_ML = 29,
```

```
    XR_FACIAL_BLEND_SHAPE_LIP_SUCK_RB_ML = 30,
    XR_FACIAL_BLEND_SHAPE_LIP_SUCK_RT_ML = 31,
    XR_FACIAL_BLEND_SHAPE_LIP_TIGHTENER_L_ML = 32,
    XR_FACIAL_BLEND_SHAPE_LIP_TIGHTENER_R_ML = 33,
    XR_FACIAL_BLEND_SHAPE_LIPS_TOWARD_ML = 34,
    XR_FACIAL_BLEND_SHAPE_LOWER_LIP_DEPRESSOR_L_ML = 35,
    XR_FACIAL_BLEND_SHAPE_LOWER_LIP_DEPRESSOR_R_ML = 36,
    XR_FACIAL_BLEND_SHAPE_NOSE_WRINKLER_L_ML = 37,
    XR_FACIAL_BLEND_SHAPE_NOSE_WRINKLER_R_ML = 38,
    XR_FACIAL_BLEND_SHAPE_OUTER_BROW_RAISER_L_ML = 39,
    XR_FACIAL_BLEND_SHAPE_OUTER_BROW_RAISER_R_ML = 40,
    XR_FACIAL_BLEND_SHAPE_UPPER_LID_RAISER_L_ML = 41,
    XR_FACIAL_BLEND_SHAPE_UPPER_LID_RAISER_R_ML = 42,
    XR_FACIAL_BLEND_SHAPE_UPPER_LIP_RAISER_L_ML = 43,
    XR_FACIAL_BLEND_SHAPE_UPPER_LIP_RAISER_R_ML = 44,
    XR_FACIAL_BLEND_SHAPE_TONGUE_OUT_ML = 45,
    XR_FACIAL_BLEND_SHAPE_MAX_ENUM_ML = 0x7FFFFFFF
} XrFacialBlendShapeML;
```

The XrFacialExpressionBlendShapePropertiesML::`flags` member is of the following type, and contains a bitwise-OR of zero or more bits defined in XrFacialExpressionBlendShapePropertiesFlagBitsML.

```
// Provided by XR_ML_facial_expression
typedef XrFlags64 XrFacialExpressionBlendShapePropertiesFlagsML;
```

Valid bits for XrFacialExpressionBlendShapePropertiesFlagsML are defined by XrFacialExpressionBlendShapePropertiesFlagBitsML and are specified as:

```
// Provided by XR_ML_facial_expression
// Flag bits for XrFacialExpressionBlendShapePropertiesFlagsML
static const XrFacialExpressionBlendShapePropertiesFlagsML
XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_VALID_BIT_ML = 0x00000001;
static const XrFacialExpressionBlendShapePropertiesFlagsML
XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_TRACKED_BIT_ML = 0x00000002;
```

The flag bits' meaning are described as below:

Flag Descriptions

- XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_VALID_BIT_ML — Indicates whether the blend shape is valid.
- XR_FACIAL_EXPRESSION_BLEND_SHAPE_PROPERTIES_TRACKED_BIT_ML — Indicates whether the blend shape is being tracked by the runtime.

12.176.7. Example code for obtaining facial expression information

The following example code demonstrates how to obtain weights for facial expression blend shapes.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// Confirm face tracking system support.
XrSystemFacialExpressionPropertiesML systemFacialExpressionClientProperties {
    .type = XR_TYPE_SYSTEM_FACIAL_EXPRESSION_PROPERTIES_ML,
};
XrSystemProperties systemProperties {
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &systemFacialExpressionClientProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!systemFacialExpressionClientProperties.supportsFacialExpression) {
    // The system does not support face tracking
    return;
}

// Get function pointer for xrCreateFacialExpressionClientML.
PFN_xrCreateFacialExpressionClientML pfnCreateFacialExpressionClientML = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateFacialExpressionClientML",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateFacialExpressionClientML)));

// Create a client that queries for default set of facial expressions.
XrFacialExpressionClientML facialExpressionClient = {};
  XrFacialExpressionClientCreateInfoML createInfo {
      .type = XR_TYPE_FACIAL_EXPRESSION_CLIENT_CREATE_INFO_ML,
  };
  CHK_XR(pfnCreateFacialExpressionClientML(session, &createInfo, &
facialExpressionClient));

// Allocate buffers to receive facial expression data before frame
// loop starts.
```

```
const uint32_t num_blend_shapes = 2;
XrFacialExpressionBlendShapePropertiesML blendShapes[num_blend_shapes];
// User must explicitly request what facial expression blend shape to query
blendShapes[0].requestedFacialBlendShape = XR_FACIAL_BLEND_SHAPE_BROW_LOWERER_L_ML;
blendShapes[1].requestedFacialBlendShape = XR_FACIAL_BLEND_SHAPE_BROW_LOWERER_R_ML;

// Get function pointer for xrGetFacialExpressionBlendShapePropertiesML.
PFN_xrGetFacialExpressionBlendShapePropertiesML pfnGetFacialExpressionBlendShapesML =
nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrGetFacialExpressionBlendShapePropertiesML",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnGetFacialExpressionBlendShapesML)));
while (1) {
    // ...
    // For every frame in the frame loop
    // ...
    XrFrameState frameState; // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrFacialExpressionBlendShapeGetInfoML expressionInfo {
        .type = XR_TYPE_FACIAL_EXPRESSION_BLEND_SHAPE_GET_INFO_ML,
    };

    CHK_XR(pfnGetFacialExpressionBlendShapesML(facialExpressionClient, &expressionInfo,
num_blend_shapes, blendShapes));

    for (uint32_t i = 0; i < num_blend_shapes; ++i) {
        // blendShapes[i] contains the properties of specific blend shape
    }
}
```

12.176.8. New Object Types

- XrFacialExpressionClientML

12.176.9. New Commands

- xrCreateFacialExpressionClientML

Overview

This extension provides access to Magic Leap specific extensions to frame settings like focus distance, vignette, and protection.

New Flag Types

The XrFrameEndInfoML::`flags` member is of the following type, and contains a bitwise-OR of zero or more of the bits defined in XrFrameEndInfoFlagBitsML.

```
// Provided by XR_ML_frame_end_info
typedef XrFlags64 XrFrameEndInfoFlagsML;
```

Valid bits for XrFrameEndInfoFlagsML are defined by XrFrameEndInfoFlagBitsML, which is specified as:

```
// Provided by XR_ML_frame_end_info
// Flag bits for XrFrameEndInfoFlagsML
static const XrFrameEndInfoFlagsML XR_FRAME_END_INFO_PROTECTED_BIT_ML = 0x00000001;
static const XrFrameEndInfoFlagsML XR_FRAME_END_INFO_VIGNETTE_BIT_ML = 0x00000002;
```

The flag bits have the following meanings:

Flag Descriptions

- `XR_FRAME_END_INFO_PROTECTED_BIT_ML` — Indicates that the content for this frame is protected and should not be recorded or captured outside the graphics system.
- `XR_FRAME_END_INFO_VIGNETTE_BIT_ML` — Indicates that a soft fade to transparent should be added to the frame in the compositor to blend any hard edges at the FOV limits.

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_FRAME_END_INFO_ML`

New Structures

The XrFrameEndInfoML structure is defined as:

```
// Provided by XR_ML_frame_end_info
typedef struct XrFrameEndInfoML {
    XrStructureType          type;
    const void*              next;
    float                    focusDistance;
    XrFrameEndInfoFlagsML    flags;
} XrFrameEndInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `focusDistance` is the distance, in meters, to defined focus point for the client content. The focus distance is interpreted as the positive distance to the client-determined object of interest (relative to the forward vector of the Lightwear).
- `flags` is a bitmask of XrFrameEndInfoFlagsML

Valid Usage (Implicit)

- The `XR_ML_frame_end_info` extension **must** be enabled prior to using XrFrameEndInfoML
- `type` **must** be `XR_TYPE_FRAME_END_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrFrameEndInfoFlagBitsML values

Overview

This extension provides control over the global dimmer panel of the Magic Leap 2. The Global

Dimming™ feature dims the entire display without dimming digital content to make text and images more solid and precise.

Note that when using the XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND mode the alpha channel of the color swapchain image is combined with the global dimmer value. The global dimmer however is able to address the whole panel whereas the alpha channel covers the video addressable portion.

New Flag Types

The XrGlobalDimmerFrameEndInfoML::flags member is of the following type, and contains a bitwise-OR of zero or more of the bits defined in XrFrameEndInfoFlagBitsML.

```
// Provided by XR_ML_global_dimmer
typedef XrFlags64 XrGlobalDimmerFrameEndInfoFlagsML;
```

Valid bits for XrGlobalDimmerFrameEndInfoFlagsML are defined by XrGlobalDimmerFrameEndInfoFlagBitsML, which is specified as:

```
// Provided by XR_ML_global_dimmer
// Flag bits for XrGlobalDimmerFrameEndInfoFlagsML
static const XrGlobalDimmerFrameEndInfoFlagsML
XR_GLOBAL_DIMMER_FRAME_END_INFO_ENABLED_BIT_ML = 0x00000001;
```

The flag bits have the following meanings:

Flag Descriptions

- XR_GLOBAL_DIMMER_FRAME_END_INFO_ENABLED_BIT_ML — Indicates that the global dimmer **should** be enabled and controlled by XrGlobalDimmerFrameEndInfoML::dimmerValue.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_GLOBAL_DIMMER_FRAME_END_INFO_ML

New Structures

The XrGlobalDimmerFrameEndInfoML structure is defined as:

```
// Provided by XR_ML_global_dimmer
typedef struct XrGlobalDimmerFrameEndInfoML {
    XrStructureType                       type;
    const void*                           next;
    float                                 dimmerValue;
    XrGlobalDimmerFrameEndInfoFlagsML     flags;
} XrGlobalDimmerFrameEndInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `dimmerValue` is a value between 0.0 (transparent) and 1.0 (opaque). The runtime **may** adjust the dimmerValue used during composition at the runtime's discretion. This **may** be done for user safety, display performance, or other reasons. Values outside of the range are silently clamped.
- `flags` is a bitmask of XrGlobalDimmerFrameEndInfoFlagsML

Valid Usage (Implicit)

- The `XR_ML_global_dimmer` extension **must** be enabled prior to using XrGlobalDimmerFrameEndInfoML
- `type` **must** be `XR_TYPE_GLOBAL_DIMMER_FRAME_END_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrGlobalDimmerFrameEndInfoFlagBitsML values

12.179.1. Overview

A Magic Leap localization map is a container that holds metadata about the scanned environment. It is a digital copy of a physical place. A localization map holds spatial anchors, dense mesh, planes, feature points, and positional data.

- Spatial anchors - Used for persistent placement of content.
- Dense mesh - 3D triangulated geometry representing Magic Leap device understanding of the real-world geometry of an area.
- Planes - Large, flat surfaces derived from dense mesh data.

Localization maps **can** be created on device or in the Magic Leap AR Cloud. There are two types - "On Device" and "Cloud".

- "On Device" for OpenXR (local space for MagicLeap) - are for a single device and **can** be shared via the export/import mechanism.
- "Cloud" for OpenXR (shared space for MagicLeap) - **can** be shared across multiple MagicLeap devices in the AR Cloud.

Note

Localization Maps are called Spaces in the Magic Leap C-API.

Permissions

Android applications **must** have the com.magicleap.permission.SPACE_MANAGER permission listed in their manifest to use these functions:

- xrQueryLocalizationMapsML
- xrRequestMapLocalizationML

(protection level: normal)

Android applications **must** have the com.magicleap.permission.SPACE_IMPORT_EXPORT permission listed in their manifest and granted to use these functions:

- xrImportLocalizationMapML
- xrCreateExportedLocalizationMapML

(protection level: dangerous)

12.179.2. Current Localization Map Information

Applications **can** receive notifications when the current localization map changes by calling xrPollEvent and handling the XrEventDataLocalizationChangedML type. To enable these events call xrEnableLocalizationEventsML.

The XrEventDataLocalizationChangedML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrEventDataLocalizationChangedML {
     XrStructureType                 type;
    const void*                      next;
    XrSession                        session;
    XrLocalizationMapStateML         state;
    XrLocalizationMapML              map;
    XrLocalizationMapConfidenceML    confidence;
    XrLocalizationMapErrorFlagsML    errorFlags;
} XrEventDataLocalizationChangedML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `session` is the session to which this change event applies.
- `state` is the current XrLocalizationMapStateML of the map.
- `map` is the XrLocalizationMapML of the current map.
- `confidence` is the XrLocalizationMapConfidenceML of the current map.
- `errorFlags` is a a bitwise-OR of zero or more of the bits defined in XrLocalizationMapErrorFlagBitsML in the case that the localization map has low confidence.

By default the runtime does not send these events but calling xrEnableLocalizationEventsML function enables the events. When this function is called the XrEventDataLocalizationChangedML event will always be posted to the event queue, regardless of whether the map localization state has changed. This allows the application to synchronize with the current state.

Note

The arrival of the event is asynchronous to this call.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to using XrEventDataLocalizationChangedML
- `type` **must** be `XR_TYPE_EVENT_DATA_LOCALIZATION_CHANGED_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The bitmask type XrLocalizationMapErrorFlagsML is defined as:

```
// Provided by XR_ML_localization_map
typedef XrFlags64 XrLocalizationMapErrorFlagsML;
```

As used in XrEventDataLocalizationChangedML::`errorFlags` field, XrLocalizationMapErrorFlagsML contains a bitwise-OR of zero or more of the bits defined in XrLocalizationMapErrorFlagBitsML.

```
// Provided by XR_ML_localization_map
// Flag bits for XrLocalizationMapErrorFlagsML
static const XrLocalizationMapErrorFlagsML XR_LOCALIZATION_MAP_ERROR_UNKNOWN_BIT_ML =
0x00000001;
static const XrLocalizationMapErrorFlagsML
XR_LOCALIZATION_MAP_ERROR_OUT_OF_MAPPED_AREA_BIT_ML = 0x00000002;
static const XrLocalizationMapErrorFlagsML
XR_LOCALIZATION_MAP_ERROR_LOW_FEATURE_COUNT_BIT_ML = 0x00000004;
static const XrLocalizationMapErrorFlagsML
XR_LOCALIZATION_MAP_ERROR_EXCESSIVE_MOTION_BIT_ML = 0x00000008;
static const XrLocalizationMapErrorFlagsML XR_LOCALIZATION_MAP_ERROR_LOW_LIGHT_BIT_ML =
0x00000010;
static const XrLocalizationMapErrorFlagsML XR_LOCALIZATION_MAP_ERROR_HEADPOSE_BIT_ML =
0x00000020;
```

The flag bits have the following meanings:

Flag Descriptions

- XR_LOCALIZATION_MAP_ERROR_UNKNOWN_BIT_ML — Localization failed for an unknown reason.
- XR_LOCALIZATION_MAP_ERROR_OUT_OF_MAPPED_AREA_BIT_ML — Localization failed because the user is outside of the mapped area.
- XR_LOCALIZATION_MAP_ERROR_LOW_FEATURE_COUNT_BIT_ML — There are not enough features in the environment to successfully localize.
- XR_LOCALIZATION_MAP_ERROR_EXCESSIVE_MOTION_BIT_ML — Localization failed due to excessive motion.
- XR_LOCALIZATION_MAP_ERROR_LOW_LIGHT_BIT_ML — Localization failed because the lighting levels are too low in the environment.
- XR_LOCALIZATION_MAP_ERROR_HEADPOSE_BIT_ML — A headpose failure caused localization to be unsuccessful.

The xrEnableLocalizationEventsML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrEnableLocalizationEventsML(
    XrSession                                   session,
    const XrLocalizationEnableEventsInfoML *    info);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `info` is a pointer to an XrLocalizationEnableEventsInfoML structure.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to calling xrEnableLocalizationEventsML
- `session` **must** be a valid XrSession handle
- `info` **must** be a pointer to a valid XrLocalizationEnableEventsInfoML structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LOCALIZATION_MAP_PERMISSION_DENIED_ML`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrLocalizationEnableEventsInfoML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrLocalizationEnableEventsInfoML {
    XrStructureType    type;
    const void*        next;
    XrBool32           enabled;
} XrLocalizationEnableEventsInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `enabled` is the flag to enable/disable localization status events.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to using XrLocalizationEnableEventsInfoML
- `type` **must** be `XR_TYPE_LOCALIZATION_ENABLE_EVENTS_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrLocalizationMapML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrLocalizationMapML {
    XrStructureType            type;
    void*                      next;
    char                       name[XR_MAX_LOCALIZATION_MAP_NAME_LENGTH_ML];
    XrUuidEXT                  mapUuid;
    XrLocalizationMapTypeML    mapType;
} XrLocalizationMapML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `name` is a human readable name of the localization map, as a null terminated UTF-8 string. This name is set outside of this extension.
- `mapUuid` is the XrUuidEXT of the localization map.
- `mapType` is the XrLocalizationMapTypeML of the map.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to using XrLocalizationMapML
- type **must** be XR_TYPE_LOCALIZATION_MAP_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- name **must** be a null-terminated UTF-8 string whose length is less than or equal to XR_MAX_LOCALIZATION_MAP_NAME_LENGTH_ML
- If mapType is not 0, mapType **must** be a valid XrLocalizationMapTypeML value

12.179.3. Listing Localization Maps

Localization maps available to the application **can** be queried using xrQueryLocalizationMapsML.

The xrQueryLocalizationMapsML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrQueryLocalizationMapsML(
    XrSession                                   session,
    const XrLocalizationMapQueryInfoBaseHeaderML* queryInfo,
    uint32_t                                    mapCapacityInput,
    uint32_t *                                  mapCountOutput,
    XrLocalizationMapML*                        maps);
```

Parameter Descriptions

- session is a handle to an XrSession previously created with xrCreateSession.
- queryInfo is an **optional** enumeration filter based on XrLocalizationMapQueryInfoBaseHeaderML to use.
- mapCapacityInput is the capacity of the maps array, or 0 to indicate a request to retrieve the required capacity.
- mapCountOutput is filled in by the runtime with the count of maps written or the required capacity in the case that mapCapacityInput is insufficient.
- maps is an array of XrLocalizationMapML filled in by the runtime, but **can** be NULL if mapCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required maps size.

The list of localization maps returned will depend on the current device mapping mode. Only the localization maps associated with the current mapping mode will be returned by this call. Device

mapping mode (e.g. XR_LOCALIZATION_MAP_TYPE_ON_DEVICE_ML or XR_LOCALIZATION_MAP_TYPE_CLOUD_ML) **can** only be changed via the system application(s).

The list of maps known to the runtime **may** change between the two calls to xrQueryLocalizationMapsML. This is however a rare occurrence and the application **may** retry the call again if it receives XR_ERROR_SIZE_INSUFFICIENT.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to calling xrQueryLocalizationMapsML
- session **must** be a valid XrSession handle
- If queryInfo is not NULL, queryInfo **must** be a pointer to a valid XrLocalizationMapQueryInfoBaseHeaderML-based structure
- mapCountOutput **must** be a pointer to a uint32_t value
- If mapCapacityInput is not 0, maps **must** be a pointer to an array of mapCapacityInput XrLocalizationMapML structures

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LOCALIZATION_MAP_PERMISSION_DENIED_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrLocalizationMapQueryInfoBaseHeaderML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrLocalizationMapQueryInfoBaseHeaderML {
    XrStructureType    type;
    const void*        next;
} XrLocalizationMapQueryInfoBaseHeaderML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

Currently no filters are available.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to using XrLocalizationMapQueryInfoBaseHeaderML
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.179.4. Request Localization Map

Applications **can** change the current map by calling xrRequestMapLocalizationML.

The xrRequestMapLocalizationML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrRequestMapLocalizationML(
    XrSession                                   session,
    const XrMapLocalizationRequestInfoML*       requestInfo);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `requestInfo` contains XrMapLocalizationRequestInfoML on the localization map to request.

This is an asynchronous request. Listen for XrEventDataLocalizationChangedML events to get the results of the localization. A new request for localization will override all the past requests for localization that are yet to be completed.

The runtime **must** return XR_ERROR_LOCALIZATION_MAP_UNAVAILABLE_ML if the requested is not a map known to the runtime.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to calling xrRequestMapLocalizationML
- session **must** be a valid XrSession handle
- requestInfo **must** be a pointer to a valid XrMapLocalizationRequestInfoML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LOCALIZATION_MAP_FAIL_ML
- XR_ERROR_LOCALIZATION_MAP_PERMISSION_DENIED_ML
- XR_ERROR_LOCALIZATION_MAP_UNAVAILABLE_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrMapLocalizationRequestInfoML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrMapLocalizationRequestInfoML {
    XrStructureType    type;
    const void*        next;
    XrUuidEXT          mapUuid;
} XrMapLocalizationRequestInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `mapUuid` is the XrUuidEXT of the localization map to request. This mapUuid **can** be obtained via xrQueryLocalizationMapsML.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to using XrMapLocalizationRequestInfoML
- `type` **must** be `XR_TYPE_MAP_LOCALIZATION_REQUEST_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.179.5. Import and Exporting

This API supports exporting and importing of device localization maps. The runtime **must** not export AR Cloud maps and **must** return `XR_ERROR_LOCALIZATION_MAP_CANNOT_EXPORT_CLOUD_MAP_ML` if the application attempts to do so.

The format of the exported localization map data **can** change with OS version updates.

- Backwards compatibility: exports using OS version n **should** work on OS versions up to and including OS version n-4.
- Forwards compatibility: exports using OS version n is not guaranteed to work on OS versions > n.

Developers are strongly encouraged to encrypt the exported localization maps.

The xrImportLocalizationMapML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrImportLocalizationMapML(
    XrSession                                   session,
    const XrLocalizationMapImportInfoML*        importInfo,
    XrUuidEXT*                                  mapUuid);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `importInfo` contains XrLocalizationMapImportInfoML on the localization map to import.
- `mapUuid` is the XrUuidEXT of the newly imported localization map filled in by the runtime.

The runtime **must** return `XR_ERROR_LOCALIZATION_MAP_ALREADY_EXISTS_ML` if the map that is being imported already exists. The runtime **must** return `XR_ERROR_LOCALIZATION_MAP_INCOMPATIBLE_ML` if the map being imported is not compatible.

xrImportLocalizationMapML **may** take a long time to complete; as such applications **should** not call this from the frame loop.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to calling xrImportLocalizationMapML
- `session` **must** be a valid XrSession handle
- `importInfo` **must** be a pointer to a valid XrLocalizationMapImportInfoML structure
- If `mapUuid` is not `NULL`, `mapUuid` **must** be a pointer to an XrUuidEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LOCALIZATION_MAP_ALREADY_EXISTS_ML
- XR_ERROR_LOCALIZATION_MAP_IMPORT_EXPORT_PERMISSION_DENIED_ML
- XR_ERROR_LOCALIZATION_MAP_INCOMPATIBLE_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrLocalizationMapImportInfoML structure is defined as:

```
// Provided by XR_ML_localization_map
typedef struct XrLocalizationMapImportInfoML {
    XrStructureType    type;
    const void*        next;
    uint32_t           size;
    char*              data;
} XrLocalizationMapImportInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- size is the size in bytes of the data member.
- data is the byte data of the previously exported localization map.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to using XrLocalizationMapImportInfoML
- type **must** be XR_TYPE_LOCALIZATION_MAP_IMPORT_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- data **must** be a pointer to an array of size char values
- The size parameter **must** be greater than 0

Exporting

The xrCreateExportedLocalizationMapML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrCreateExportedLocalizationMapML(
    XrSession                                   session,
    const XrUuidEXT*                            mapUuid,
    XrExportedLocalizationMapML*                map);
```

Parameter Descriptions

- session is a handle to an XrSession previously created with xrCreateSession.
- mapUuid is a pointer to the uuid of the map to export.
- map is a pointer to a map handle filled in by the runtime.

xrCreateExportedLocalizationMapML creates a frozen copy of the mapUuid localization map that **can** be exported using xrGetExportedLocalizationMapDataML. Applications **should** call xrDestroyExportedLocalizationMapML once they are done with the data.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to calling xrCreateExportedLocalizationMapML
- session **must** be a valid XrSession handle
- mapUuid **must** be a pointer to a valid XrUuidEXT structure
- map **must** be a pointer to an XrExportedLocalizationMapML handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_LOCALIZATION_MAP_CANNOT_EXPORT_CLOUD_MAP_ML
- XR_ERROR_LOCALIZATION_MAP_IMPORT_EXPORT_PERMISSION_DENIED_ML
- XR_ERROR_LOCALIZATION_MAP_UNAVAILABLE_ML
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrDestroyExportedLocalizationMapML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrDestroyExportedLocalizationMapML(
    XrExportedLocalizationMapML                 map);
```

Parameter Descriptions

- map is the map to destroy.

Valid Usage (Implicit)

- The XR_ML_localization_map extension **must** be enabled prior to calling xrDestroyExportedLocalizationMapML
- map **must** be a valid XrExportedLocalizationMapML handle

Thread Safety

- Access to `map`, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

The xrGetExportedLocalizationMapDataML function is defined as:

```
// Provided by XR_ML_localization_map
XrResult xrGetExportedLocalizationMapDataML(
    XrExportedLocalizationMapML                 map,
    uint32_t                                    bufferCapacityInput,
    uint32_t*                                   bufferCountOutput,
    char*                                       buffer);
```

Parameter Descriptions

- `map` is the map to export.
- `bufferCapacityInput` is the capacity of the buffer array, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` is filled in by the runtime with the count of bytes written or the required capacity in the case that bufferCapacityInput is insufficient.
- `buffer` is an array of bytes filled in by the runtime.

xrGetExportedLocalizationMapDataML **may** take a long time to complete; as such applications **should** not call this from the frame loop.

Valid Usage (Implicit)

- The `XR_ML_localization_map` extension **must** be enabled prior to calling xrGetExportedLocalizationMapDataML
- `map` **must** be a valid XrExportedLocalizationMapML handle
- `bufferCountOutput` **must** be a pointer to a `uint32_t` value
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` char values

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

12.179.6. Reference Space

Applications localized into the same localization map **can** use this reference space to place virtual content in the same physical location.

`XR_REFERENCE_SPACE_TYPE_LOCALIZATION_MAP_ML` is the reference space of the current localization map. Creating a space is done via xrCreateReferenceSpace.

The runtime **must** emit the XrEventDataReferenceSpaceChangePending event if the reference space is changing due to a localization map change.

The runtime **may** move the physical location of the origin of this space as it updates its understanding of the physical space to maintain consistency without sending the XrEventDataReferenceSpaceChangePending event.

For a given XrUuidEXT the runtime **must** keep the position and orientation of this space identical across more than one XrInstance, including for different users and different hardware.

The runtime **must** create this reference space as gravity-aligned to exclude pitch and roll, with +Y up.

12.179.7. Example code

The following code shows how to list the currently available localization maps.

```
uint32_t mapCount = 0;
CHK_XR(xrQueryLocalizationMapsML(session, nullptr, 0, &mapCount, nullptr));

std::vector<XrLocalizationMapML> maps(mapCount, {
    .type = XR_TYPE_LOCALIZATION_MAP_ML,
});

CHK_XR(xrQueryLocalizationMapsML(session, nullptr, static_cast<uint32_t>(maps.size()),
&mapCount, maps.data()));
```

This code shows how to poll for localization events.

```
XrEventDataBuffer event {
    .type = XR_TYPE_EVENT_DATA_BUFFER,
};
XrResult result = xrPollEvent(instance, &event);
if (result == XR_SUCCESS) {
    switch (event.type) {
        case XR_TYPE_EVENT_DATA_LOCALIZATION_CHANGED_ML: {
            const auto& localization_event =
              *reinterpret_cast<XrEventDataLocalizationChangedML*>(&event);
            // Use the data in localization_event.
            break;
        }
        // Handle other events as well as usual.
    }
}
```

12.179.8. Constants

New Object Types

```
// Provided by XR_ML_localization_map
XR_DEFINE_HANDLE(XrExportedLocalizationMapML)
```

XrExportedLocalizationMapML represents a frozen exported localization map.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_LOCALIZATION_MAP_ML
- XR_TYPE_EVENT_DATA_LOCALIZATION_CHANGED_ML
- XR_TYPE_MAP_LOCALIZATION_REQUEST_INFO_ML
- XR_TYPE_LOCALIZATION_MAP_IMPORT_INFO_ML
- XR_TYPE_LOCALIZATION_ENABLE_EVENTS_INFO_ML

XrResult enumeration is extended with:

- XR_ERROR_LOCALIZATION_MAP_INCOMPATIBLE_ML
- XR_ERROR_LOCALIZATION_MAP_UNAVAILABLE_ML
- XR_ERROR_LOCALIZATION_MAP_IMPORT_EXPORT_PERMISSION_DENIED_ML
- XR_ERROR_LOCALIZATION_MAP_PERMISSION_DENIED_ML
- XR_ERROR_LOCALIZATION_MAP_ALREADY_EXISTS_ML
- XR_ERROR_LOCALIZATION_MAP_CANNOT_EXPORT_CLOUD_MAP_ML
- XR_ERROR_LOCALIZATION_MAP_FAIL_ML

New Enums

```
// Provided by XR_ML_localization_map
typedef enum XrLocalizationMapStateML {
    XR_LOCALIZATION_MAP_STATE_NOT_LOCALIZED_ML = 0,
    XR_LOCALIZATION_MAP_STATE_LOCALIZED_ML = 1,
    XR_LOCALIZATION_MAP_STATE_LOCALIZATION_PENDING_ML = 2,
    XR_LOCALIZATION_MAP_STATE_LOCALIZATION_SLEEPING_BEFORE_RETRY_ML = 3,
    XR_LOCALIZATION_MAP_STATE_MAX_ENUM_ML = 0x7FFFFFFF
} XrLocalizationMapStateML;
```

Enum	Description
XR_LOCALIZATION_MAP_STATE_NOT_LOCALIZED_ML	The system is not localized into a map. Features like Spatial Anchors relying on localization will not work.
XR_LOCALIZATION_MAP_STATE_LOCALIZED_ML	The system is localized into a map.
XR_LOCALIZATION_MAP_STATE_LOCALIZATION_PENDING_ML	The system is localizing into a map.
XR_LOCALIZATION_MAP_STATE_LOCALIZATION_SLEEPING_BEFORE_RETRY_ML	Initial localization failed, the system will retry localization.

```
// Provided by XR_ML_localization_map
typedef enum XrLocalizationMapConfidenceML {
    XR_LOCALIZATION_MAP_CONFIDENCE_POOR_ML = 0,
    XR_LOCALIZATION_MAP_CONFIDENCE_FAIR_ML = 1,
    XR_LOCALIZATION_MAP_CONFIDENCE_GOOD_ML = 2,
    XR_LOCALIZATION_MAP_CONFIDENCE_EXCELLENT_ML = 3,
    XR_LOCALIZATION_MAP_CONFIDENCE_MAX_ENUM_ML = 0x7FFFFFFF
} XrLocalizationMapConfidenceML;
```

Enum	Description
XR_LOCALIZATION_MAP_CONFIDENCE_POOR_ML	The localization map has poor confidence, systems relying on the localization map are likely to have poor performance.
XR_LOCALIZATION_MAP_CONFIDENCE_FAIR_ML	The confidence is fair, current environmental conditions may adversely affect localization.
XR_LOCALIZATION_MAP_CONFIDENCE_GOOD_ML	The confidence is high, persistent content should be stable.
XR_LOCALIZATION_MAP_CONFIDENCE_EXCELLENT_ML	This is a very high-confidence localization, persistent content will be very stable.

```
// Provided by XR_ML_localization_map
typedef enum XrLocalizationMapTypeML {
    XR_LOCALIZATION_MAP_TYPE_ON_DEVICE_ML = 0,
    XR_LOCALIZATION_MAP_TYPE_CLOUD_ML = 1,
    XR_LOCALIZATION_MAP_TYPE_MAX_ENUM_ML = 0x7FFFFFFF
} XrLocalizationMapTypeML;
```

Enum	Description
XR_LOCALIZATION_MAP_TYPE_ON_DEVICE_ML	The system is localized into an On-Device map, published anchors are not shared between different devices.
XR_LOCALIZATION_MAP_TYPE_CLOUD_ML	The system is localized into a Cloud Map, anchors are shared per cloud account settings.

New Enum Constants

XrReferenceSpaceType enumeration is extended with:

- XR_REFERENCE_SPACE_TYPE_LOCALIZATION_MAP_ML

New Defines

Karthik Kadappan, Magic Leap

12.180.1. Overview

This extension **can** be used to track and query fiducial markers like QR codes, AprilTag markers, and ArUco markers, and detect, but not locate, 1D barcodes like Code 128, UPC-A.

Permissions

Android applications **must** have the `com.magicleap.permission.MARKER_TRACKING` permission listed in their manifest to use this extension. (protection level: normal)

12.180.2. Creating a Marker Detector

```
// Provided by XR_ML_marker_understanding
XR_DEFINE_HANDLE(XrMarkerDetectorML)
```

The XrMarkerDetectorML handle represents the resources for detecting one or more markers.

A marker detector handle detects a single type of marker, specified by a value of XrMarkerTypeML. To detect more than one marker type, a runtime **may** support creating multiple marker detector handles.

This handle **can** be used to detect markers using other functions in this extension.

The xrCreateMarkerDetectorML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrCreateMarkerDetectorML(
    XrSession                                   session,
    const XrMarkerDetectorCreateInfoML*         createInfo,
    XrMarkerDetectorML*                         markerDetector);
```

Parameter Descriptions

- `session` is an XrSession in which the marker detection will be active.
- `createInfo` is the XrMarkerDetectorCreateInfoML used to specify the marker detection.
- `markerDetector` is the returned XrMarkerDetectorML handle.

An application creates an XrMarkerDetectorML handle using the xrCreateMarkerDetectorML function. If `createInfo` contains mutually exclusive contents, the runtime **must** return `XR_ERROR_MARKER_DETECTOR_INVALID_CREATE_INFO_ML`.

If a runtime is unable to create a marker detector due to some internal limit, the runtime **must** return `XR_ERROR_LIMIT_REACHED`.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrCreateMarkerDetectorML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrMarkerDetectorCreateInfoML structure
- `markerDetector` **must** be a pointer to an XrMarkerDetectorML handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MARKER_DETECTOR_INVALID_CREATE_INFO_ML
- XR_ERROR_MARKER_DETECTOR_PERMISSION_DENIED_ML
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrMarkerDetectorCreateInfoML structure is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorCreateInfoML {
    XrStructureType              type;
    const void*                  next;
    XrMarkerDetectorProfileML    profile;
    XrMarkerTypeML               markerType;
} XrMarkerDetectorCreateInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- profile is the marker tracker profile to be used.
- markerType is the detector type that this tracker enables.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to using XrMarkerDetectorCreateInfoML
- type **must** be XR_TYPE_MARKER_DETECTOR_CREATE_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrMarkerDetectorAprilTagInfoML, XrMarkerDetectorArucoInfoML, XrMarkerDetectorCustomProfileInfoML, XrMarkerDetectorSizeInfoML
- profile **must** be a valid XrMarkerDetectorProfileML value
- markerType **must** be a valid XrMarkerTypeML value

The possible premade profiles for an XrMarkerDetectorML are specified by the XrMarkerDetectorProfileML enumeration:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorProfileML {
    XR_MARKER_DETECTOR_PROFILE_DEFAULT_ML = 0,
    XR_MARKER_DETECTOR_PROFILE_SPEED_ML = 1,
    XR_MARKER_DETECTOR_PROFILE_ACCURACY_ML = 2,
    XR_MARKER_DETECTOR_PROFILE_SMALL_TARGETS_ML = 3,
    XR_MARKER_DETECTOR_PROFILE_LARGE_FOV_ML = 4,
    XR_MARKER_DETECTOR_PROFILE_CUSTOM_ML = 5,
    XR_MARKER_DETECTOR_PROFILE_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorProfileML;
```

Enumerant Descriptions

- XR_MARKER_DETECTOR_PROFILE_DEFAULT_ML — Tracker profile that covers standard use cases. If this does not suite the needs of the application try the other profiles listed below.
- XR_MARKER_DETECTOR_PROFILE_SPEED_ML — Optimized for speed. Use this profile to reduce the compute load and increase detection/tracker speed. This can result in low accuracy poses.
- XR_MARKER_DETECTOR_PROFILE_ACCURACY_ML — Optimized for accuracy. Use this profile to optimize for accurate marker poses. This can cause increased load on the compute.
- XR_MARKER_DETECTOR_PROFILE_SMALL_TARGETS_ML — Optimized for small targets. Use this profile to optimize for markers that are small or for larger markers that need to be detected from afar.
- XR_MARKER_DETECTOR_PROFILE_LARGE_FOV_ML — Optimized for FoV. Use this profile to be able to detect markers across a larger FoV. The marker tracker system will attempt to use multiple cameras to detect the markers.
- XR_MARKER_DETECTOR_PROFILE_CUSTOM_ML — Custom Tracker Profile. The application can define a custom tracker profile. See XrMarkerDetectorCustomProfileInfoML for more details.

The type of marker to be tracked is specified via XrMarkerDetectorML:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerTypeML {
    XR_MARKER_TYPE_ARUCO_ML = 0,
    XR_MARKER_TYPE_APRIL_TAG_ML = 1,
    XR_MARKER_TYPE_QR_ML = 2,
    XR_MARKER_TYPE_EAN_13_ML = 3,
    XR_MARKER_TYPE_UPC_A_ML = 4,
    XR_MARKER_TYPE_CODE_128_ML = 5,
    XR_MARKER_TYPE_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerTypeML;
```

Enumerant Descriptions

- `XR_MARKER_TYPE_ARUCO_ML` — Aruco Marker detection and localization. The marker id of the Aruco marker is available via xrGetMarkerNumberML.
- `XR_MARKER_TYPE_APRIL_TAG_ML` — AprilTag detection and localization. The marker id of the AprilTags is available via xrGetMarkerNumberML.
- `XR_MARKER_TYPE_QR_ML` — QR code detection and localization. The contents of the QR code is available via xrGetMarkerStringML.
- `XR_MARKER_TYPE_EAN_13_ML` — EAN-13, detection only, not locatable. The contents of the barcode is available via xrGetMarkerStringML.
- `XR_MARKER_TYPE_UPC_A_ML` — UPC-A, detection only, not locatable. The contents of the barcode is available via xrGetMarkerStringML.
- `XR_MARKER_TYPE_CODE_128_ML` — Code 128, detection only, not locatable. The contents of the barcode is available via xrGetMarkerStringML.

An application specifies details of the type of marker to be tracked by chaining an `XrMarkerDetector*InfoML` structure to XrMarkerDetectorCreateInfoML. Some of these structure types **must** be included to enable detection or locating, depending on the marker type.

The following structures are used by the ArUco, AprilTag, and QR code detectors:

Marker Type	Structures
ArUco	XrMarkerDetectorArucoInfoML XrMarkerDetectorSizeInfoML
AprilTag	XrMarkerDetectorAprilTagInfoML XrMarkerDetectorSizeInfoML
QR Code	XrMarkerDetectorSizeInfoML

The XrMarkerDetectorSizeInfoML **may** be optional depending on runtime support for estimating marker size. A higher localization accuracy **may** be obtained by specifying the marker size. If the runtime does not support estimating marker size it **must** return `XR_ERROR_VALIDATION_FAILURE` if XrMarkerDetectorSizeInfoML is omitted.

The XrMarkerDetectorArucoInfoML structure extends XrMarkerDetectorCreateInfoML and is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorArucoInfoML {
    XrStructureType        type;
    const void*            next;
    XrMarkerArucoDictML    arucoDict;
} XrMarkerDetectorArucoInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `arucoDict` is the ArUco dictionary name from which markers will be detected.

This structure is required by the `XR_MARKER_TYPE_ARUCO_ML` detector.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to using XrMarkerDetectorArucoInfoML
- `type` **must** be `XR_TYPE_MARKER_DETECTOR_ARUCO_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `arucoDict` **must** be a valid XrMarkerArucoDictML value

The XrMarkerArucoDictML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerArucoDictML {
    XR_MARKER_ARUCO_DICT_4X4_50_ML = 0,
    XR_MARKER_ARUCO_DICT_4X4_100_ML = 1,
    XR_MARKER_ARUCO_DICT_4X4_250_ML = 2,
    XR_MARKER_ARUCO_DICT_4X4_1000_ML = 3,
    XR_MARKER_ARUCO_DICT_5X5_50_ML = 4,
    XR_MARKER_ARUCO_DICT_5X5_100_ML = 5,
    XR_MARKER_ARUCO_DICT_5X5_250_ML = 6,
    XR_MARKER_ARUCO_DICT_5X5_1000_ML = 7,
    XR_MARKER_ARUCO_DICT_6X6_50_ML = 8,
    XR_MARKER_ARUCO_DICT_6X6_100_ML = 9,
    XR_MARKER_ARUCO_DICT_6X6_250_ML = 10,
    XR_MARKER_ARUCO_DICT_6X6_1000_ML = 11,
    XR_MARKER_ARUCO_DICT_7X7_50_ML = 12,
    XR_MARKER_ARUCO_DICT_7X7_100_ML = 13,
    XR_MARKER_ARUCO_DICT_7X7_250_ML = 14,
    XR_MARKER_ARUCO_DICT_7X7_1000_ML = 15,
    XR_MARKER_ARUCO_DICT_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerArucoDictML;
```

Supported predefined ArUco dictionary:

Enumerant Descriptions

- XR_MARKER_ARUCO_DICT_4X4_50_ML — 4 by 4 pixel Aruco marker dictionary with 50 IDs.
- XR_MARKER_ARUCO_DICT_4X4_100_ML — 4 by 4 pixel Aruco marker dictionary with 100 IDs.
- XR_MARKER_ARUCO_DICT_4X4_250_ML — 4 by 4 pixel Aruco marker dictionary with 250 IDs.
- XR_MARKER_ARUCO_DICT_4X4_1000_ML — 4 by 4 pixel Aruco marker dictionary with 1000 IDs.
- XR_MARKER_ARUCO_DICT_5X5_50_ML — 5 by 5 pixel Aruco marker dictionary with 50 IDs.
- XR_MARKER_ARUCO_DICT_5X5_100_ML — 5 by 5 pixel Aruco marker dictionary with 100 IDs.
- XR_MARKER_ARUCO_DICT_5X5_250_ML — 5 by 5 pixel Aruco marker dictionary with 250 IDs.
- XR_MARKER_ARUCO_DICT_5X5_1000_ML — 5 by 5 pixel Aruco marker dictionary with 1000 IDs.
- XR_MARKER_ARUCO_DICT_6X6_50_ML — 6 by 6 pixel Aruco marker dictionary with 50 IDs.
- XR_MARKER_ARUCO_DICT_6X6_100_ML — 6 by 6 pixel Aruco marker dictionary with 100 IDs.
- XR_MARKER_ARUCO_DICT_6X6_250_ML — 6 by 6 pixel Aruco marker dictionary with 250 IDs.
- XR_MARKER_ARUCO_DICT_6X6_1000_ML — 6 by 6 pixel Aruco marker dictionary with 1000 IDs.
- XR_MARKER_ARUCO_DICT_7X7_50_ML — 7 by 7 pixel Aruco marker dictionary with 50 IDs.
- XR_MARKER_ARUCO_DICT_7X7_100_ML — 7 by 7 pixel Aruco marker dictionary with 100 IDs.
- XR_MARKER_ARUCO_DICT_7X7_250_ML — 7 by 7 pixel Aruco marker dictionary with 250 IDs.
- XR_MARKER_ARUCO_DICT_7X7_1000_ML — 7 by 7 pixel Aruco marker dictionary with 1000 IDs.

The XrMarkerDetectorAprilTagInfoML structure extends XrMarkerDetectorCreateInfoML and is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorAprilTagInfoML {
    XrStructureType           type;
    const void*               next;
    XrMarkerAprilTagDictML    aprilTagDict;
} XrMarkerDetectorAprilTagInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- aprilTagDict AprilTag Dictionary name from which markers will be detected.

This structure is required by the XR_MARKER_TYPE_APRIL_TAG_ML detector.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to using XrMarkerDetectorAprilTagInfoML
- type **must** be XR_TYPE_MARKER_DETECTOR_APRIL_TAG_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- aprilTagDict **must** be a valid XrMarkerAprilTagDictML value

The XrMarkerAprilTagDictML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerAprilTagDictML {
    XR_MARKER_APRIL_TAG_DICT_16H5_ML = 0,
    XR_MARKER_APRIL_TAG_DICT_25H9_ML = 1,
    XR_MARKER_APRIL_TAG_DICT_36H10_ML = 2,
    XR_MARKER_APRIL_TAG_DICT_36H11_ML = 3,
    XR_MARKER_APRIL_TAG_DICT_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerAprilTagDictML;
```

Supported predefined AprilTag dictionary:

Enumerant Descriptions

- XR_MARKER_APRIL_TAG_DICT_16H5_ML — 4 by 4 bits, minimum Hamming distance between any two codes = 5, 30 codes.
- XR_MARKER_APRIL_TAG_DICT_25H9_ML — 5 by 5 bits, minimum Hamming distance between any two codes = 9, 35 codes.
- XR_MARKER_APRIL_TAG_DICT_36H10_ML — 6 by 6 bits, minimum Hamming distance between any two codes = 10, 2320 codes.
- XR_MARKER_APRIL_TAG_DICT_36H11_ML — 6 by 6 bits, minimum Hamming distance between any two codes = 11, 587 codes.

The XrMarkerDetectorSizeInfoML structure extends XrMarkerDetectorCreateInfoML and is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorSizeInfoML {
    XrStructureType    type;
    const void*        next;
    float              markerLength;
} XrMarkerDetectorSizeInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `markerLength` is the physical length of one side of a marker.

Pose estimation accuracy depends on the accuracy of the specified `markerLength`.

This structure is used by `XR_MARKER_TYPE_ARUCO_ML`, `XR_MARKER_TYPE_APRIL_TAG_ML`, and `XR_MARKER_TYPE_QR_ML` detectors.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to using XrMarkerDetectorSizeInfoML
- `type` **must** be `XR_TYPE_MARKER_DETECTOR_SIZE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrDestroyMarkerDetectorML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrDestroyMarkerDetectorML(
    XrMarkerDetectorML                          markerDetector);
```

Parameter Descriptions

- `markerDetector` object to destroy.

Destroy a marker detection handle.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to calling xrDestroyMarkerDetectorML
- markerDetector **must** be a valid XrMarkerDetectorML handle

Thread Safety

- Access to markerDetector, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Using a custom profile

The XrMarkerDetectorCustomProfileInfoML structure extends XrMarkerDetectorCreateInfoML and is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorCustomProfileInfoML {
    XrStructureType                          type;
    const void*                              next;
    XrMarkerDetectorFpsML                    fpsHint;
    XrMarkerDetectorResolutionML             resolutionHint;
    XrMarkerDetectorCameraML                 cameraHint;
    XrMarkerDetectorCornerRefineMethodML     cornerRefineMethod;
    XrBool32                                 useEdgeRefinement;
    XrMarkerDetectorFullAnalysisIntervalML   fullAnalysisIntervalHint;
} XrMarkerDetectorCustomProfileInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `fpsHint` is a suggestion of the category of frame rate for the detector to use.
- `resolutionHint` is a suggestion of the category of camera resolution for the detector to use.
- `cameraHint` is a suggestion of the camera set for the detector to use
- `cornerRefineMethod` selects a method for corner refinement for ArUco/AprilTag detectors. This member is ignored for detectors of other marker types.
- `useEdgeRefinement` specifies whether to run a refinement step that uses marker edges to generate even more accurate corners, but slow down tracking rate overall by consuming more compute. It affects ArUco/AprilTag markers only: this member is ignored for detectors of other marker types.
- `fullAnalysisIntervalHint` is the suggested interval between fully analyzed frames that introduce new detected markers, in addition to updating the state of already detected markers.

All marker detectors share some underlying hardware and resources, and thus not all combinations of profiles between multiple detectors are possible. If a profile (preset or custom) specified during marker detector creation is different from those used by existing marker detectors the runtime will attempt to honor the highest frame rate and fps requested.

CPU load due to marker tracking is a function of the chosen XrMarkerTypeML, XrMarkerDetectorFpsML, and XrMarkerDetectorResolutionML.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to using XrMarkerDetectorCustomProfileInfoML
- `type` **must** be `XR_TYPE_MARKER_DETECTOR_CUSTOM_PROFILE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `fpsHint` **must** be a valid XrMarkerDetectorFpsML value
- `resolutionHint` **must** be a valid XrMarkerDetectorResolutionML value
- `cameraHint` **must** be a valid XrMarkerDetectorCameraML value
- `cornerRefineMethod` **must** be a valid XrMarkerDetectorCornerRefineMethodML value
- `fullAnalysisIntervalHint` **must** be a valid XrMarkerDetectorFullAnalysisIntervalML value

The XrMarkerDetectorFpsML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorFpsML {
    XR_MARKER_DETECTOR_FPS_LOW_ML = 0,
    XR_MARKER_DETECTOR_FPS_MEDIUM_ML = 1,
    XR_MARKER_DETECTOR_FPS_HIGH_ML = 2,
    XR_MARKER_DETECTOR_FPS_MAX_ML = 3,
    XR_MARKER_DETECTOR_FPS_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorFpsML;
```

Used to hint to the back-end the max frames per second that **should** be analyzed.

Enumerant Descriptions

- XR_MARKER_DETECTOR_FPS_LOW_ML — Low FPS.
- XR_MARKER_DETECTOR_FPS_MEDIUM_ML — Medium FPS.
- XR_MARKER_DETECTOR_FPS_HIGH_ML — High FPS.
- XR_MARKER_DETECTOR_FPS_MAX_ML — Max possible FPS.

The XrMarkerDetectorResolutionML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorResolutionML {
    XR_MARKER_DETECTOR_RESOLUTION_LOW_ML = 0,
    XR_MARKER_DETECTOR_RESOLUTION_MEDIUM_ML = 1,
    XR_MARKER_DETECTOR_RESOLUTION_HIGH_ML = 2,
    XR_MARKER_DETECTOR_RESOLUTION_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorResolutionML;
```

Used to hint to the back-end the resolution that **should** be used. CPU load is a combination of chosen XrMarkerTypeML, XrMarkerDetectorFpsML, and XrMarkerDetectorResolutionML.

Enumerant Descriptions

- XR_MARKER_DETECTOR_RESOLUTION_LOW_ML — Low Resolution.
- XR_MARKER_DETECTOR_RESOLUTION_MEDIUM_ML — Medium Resolution.
- XR_MARKER_DETECTOR_RESOLUTION_HIGH_ML — High Resolution.

The XrMarkerDetectorCameraML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorCameraML {
    XR_MARKER_DETECTOR_CAMERA_RGB_CAMERA_ML = 0,
    XR_MARKER_DETECTOR_CAMERA_WORLD_CAMERAS_ML = 1,
    XR_MARKER_DETECTOR_CAMERA_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorCameraML;
```

The XrMarkerDetectorCameraML enum values are used to hint to the camera that **should** be used. This is set in the XrMarkerDetectorCustomProfileInfoML.

The RGB camera has a higher resolution than world cameras and is better suited for use cases where the target to be tracked is small or needs to be detected from far away.

XR_MARKER_DETECTOR_CAMERA_WORLD_CAMERAS_ML make use of multiple cameras to improve accuracy and increase the FoV for detection.

Enumerant Descriptions

- XR_MARKER_DETECTOR_CAMERA_RGB_CAMERA_ML — Single RGB camera.
- XR_MARKER_DETECTOR_CAMERA_WORLD_CAMERAS_ML — One or more world cameras.

The XrMarkerDetectorCornerRefineMethodML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorCornerRefineMethodML {
    XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_NONE_ML = 0,
    XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_SUBPIX_ML = 1,
    XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_CONTOUR_ML = 2,
    XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_APRIL_TAG_ML = 3,
    XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorCornerRefineMethodML;
```

The ArUco/AprilTag detector comes with several corner refinement methods. Choosing the right corner refinement method has an impact on the accuracy and speed trade-off that comes with each detection pipeline.

Enumerant Descriptions

- XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_NONE_ML — No refinement. Inaccurate corners.
- XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_SUBPIX_ML — Subpixel refinement. Corners have subpixel coordinates. High detection rate, very fast, reasonable accuracy.
- XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_CONTOUR_ML — Contour refinement. High detection rate, fast, reasonable accuracy.
- XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_APRIL_TAG_ML — AprilTag refinement. Reasonable detection rate, slowest, but very accurate. Only valid with AprilTags.

The XrMarkerDetectorFullAnalysisIntervalML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorFullAnalysisIntervalML {
    XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_MAX_ML = 0,
    XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_FAST_ML = 1,
    XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_MEDIUM_ML = 2,
    XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_SLOW_ML = 3,
    XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorFullAnalysisIntervalML;
```

In order to improve performance, the detectors do not always run on the full frame. Full frame analysis is however necessary to detect new markers that were not detected before. Use this option to control how often the detector **should** detect new markers and its impact on tracking performance.

Enumerant Descriptions

- XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_MAX_ML — Detector analyzes every frame fully.
- XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_FAST_ML — Detector analyzes frame fully very often.
- XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_MEDIUM_ML — Detector analyzes frame fully a few times per second.
- XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_SLOW_ML — Detector analyzes frame fully about every second.

12.180.3. Scanning for markers

The xrSnapshotMarkerDetectorML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrSnapshotMarkerDetectorML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerDetectorSnapshotInfoML*             snapshotInfo);
```

Parameter Descriptions

- `markerDetector` object to issue a snapshot request to.
- `snapshotInfo` is a pointer to XrMarkerDetectorSnapshotInfoML containing marker snapshot parameters.

Collects the latest marker detector state and makes it ready for inspection. This function only snapshots the non-pose state of markers. Once called, and if a new snapshot is not yet available a runtime **must** set the state of the marker detector to `XR_MARKER_DETECTOR_STATUS_PENDING_ML`. If a new state is available the runtime **must** set the state to `XR_MARKER_DETECTOR_STATUS_READY_ML`. If an error occurred the runtime **must** set the state to `XR_MARKER_DETECTOR_STATUS_ERROR_ML`. The application **may** attempt the snapshot again.

Once the application has inspected the state it is interested in it **can** call this function again and the state is set to `XR_MARKER_DETECTOR_STATUS_PENDING_ML` until a new state has been snapshotted. After each snapshot, only the currently detected markers are available for inspection, though the same marker **may** repeatedly be detected across snapshots.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrSnapshotMarkerDetectorML
- `markerDetector` **must** be a valid XrMarkerDetectorML handle
- `snapshotInfo` **must** be a pointer to an XrMarkerDetectorSnapshotInfoML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrMarkerDetectorSnapshotInfoML structure is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorSnapshotInfoML {
    XrStructureType    type;
    const void*        next;
} XrMarkerDetectorSnapshotInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to using XrMarkerDetectorSnapshotInfoML
- type **must** be XR_TYPE_MARKER_DETECTOR_SNAPSHOT_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrGetMarkerDetectorStateML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkerDetectorStateML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerDetectorStateML*                    state);
```

Parameter Descriptions

- `markerDetector` object to retrieve state information from.
- `state` points to an XrMarkerDetectorStateML in which the current state of the marker detector is returned.

xrGetMarkerDetectorStateML is used after calling xrSnapshotMarkerDetectorML to check the current status of the snapshot in progress. When XrMarkerDetectorStateML::`state` == `XR_MARKER_DETECTOR_STATUS_READY_ML`, the detector is ready to be queried, while `XR_MARKER_DETECTOR_STATUS_PENDING_ML` indicates the snapshot is still in progress. `XR_MARKER_DETECTOR_STATUS_ERROR_ML` indicates that the runtime has encountered an error getting a snapshot for the requested detector, which **may** require user intervention to solve.

If xrSnapshotMarkerDetectorML has not yet been called for the `markerDetector`, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrGetMarkerDetectorStateML
- `markerDetector` **must** be a valid XrMarkerDetectorML handle
- `state` **must** be a pointer to an XrMarkerDetectorStateML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrMarkerDetectorStateML structure is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerDetectorStateML {
    XrStructureType             type;
    void*                       next;
    XrMarkerDetectorStatusML    state;
} XrMarkerDetectorStateML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- state is the current state of the marker detector.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to using XrMarkerDetectorStateML
- type **must** be XR_TYPE_MARKER_DETECTOR_STATE_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrMarkerDetectorStatusML enumeration is defined as:

```
// Provided by XR_ML_marker_understanding
typedef enum XrMarkerDetectorStatusML {
    XR_MARKER_DETECTOR_STATUS_PENDING_ML = 0,
    XR_MARKER_DETECTOR_STATUS_READY_ML = 1,
    XR_MARKER_DETECTOR_STATUS_ERROR_ML = 2,
    XR_MARKER_DETECTOR_STATUS_MAX_ENUM_ML = 0x7FFFFFFF
} XrMarkerDetectorStatusML;
```

The XrMarkerDetectorStatusML enumeration describes the current state of the marker detector. It is queried via xrGetMarkerDetectorStateML to determine if the marker tracker is currently available for inspection.

Enumerant Descriptions

- XR_MARKER_DETECTOR_STATUS_PENDING_ML — The marker detector is working on a new snapshot.
- XR_MARKER_DETECTOR_STATUS_READY_ML — The marker detector is ready to be inspected.
- XR_MARKER_DETECTOR_STATUS_ERROR_ML — The marker detector has encountered a fatal error.

12.180.4. Getting Marker Results

The xrGetMarkersML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkersML(
    XrMarkerDetectorML                          markerDetector,
    uint32_t                                    markerCapacityInput,
    uint32_t*                                   markerCountOutput,
    XrMarkerML*                                 markers);
```

Parameter Descriptions

- `markerDetector` is the detector object to retrieve marker information from.
- `markerCapacityInput` is the capacity of the `markers` array or `0` to indicate a request to retrieve the required capacity.
- `markerCountOutput` is filled in by the runtime with the count of marker atoms written or the required capacity in the case that `markerCapacityInput` is insufficient.
- `markers` is a pointer to an array of `XrMarkerML` atoms, but **can** be `NULL` if propertyCapacityInput is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `markers` size.

Get the list of current snapshotted marker atoms, **must** only be called when the state of the detector is `XR_MARKER_DETECTOR_STATUS_READY_ML`.

If xrGetMarkerDetectorStateML has not been called and returned `XR_MARKER_DETECTOR_STATUS_READY_ML` since the last invocation of xrSnapshotMarkerDetectorML, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

The returned atoms are only valid while in the `XR_MARKER_DETECTOR_STATUS_READY_ML` state. The runtime **must** return the same atom value for the same uniquely identifiable marker across successive snapshots. It is unspecified what happens if the detector is observing two markers with the same identification patterns.

Assuming the same set of markers are in view across several snapshots, the runtime **should** return the same set of atoms. An application **can** use the list of atoms as a simple test for if a particular marker has gone in or out of view.

Note that `XrMarkerML` atoms are only usable with the XrMarkerDetectorML that returned them.

This function follows the two-call idiom for filling the `markers`.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrGetMarkersML
- `markerDetector` **must** be a valid XrMarkerDetectorML handle
- `markerCountOutput` **must** be a pointer to a `uint32_t` value
- If `markerCapacityInput` is not `0`, `markers` **must** be a pointer to an array of `markerCapacityInput` `XrMarkerML` values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_ML_marker_understanding
XR_DEFINE_ATOM(XrMarkerML)
```

The unique marker key used to retrieve the data about detected markers. For an XrMarkerDetectorML a runtime **must** use the same value of XrMarkerML each time a marker is detected in a snapshot, but an application **cannot** use a cached atom if it was not present in the most recent snapshot.

The xrGetMarkerNumberML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkerNumberML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerML                                  marker,
    uint64_t*                                   number);
```

Parameter Descriptions

- markerDetector is the detector object to retrieve marker information from.
- marker is the marker atom to be examined.
- number points to a float in which the numerical value associated with the marker is returned.

Get the numerical value of a marker, such as the ArUco ID. xrGetMarkerNumberML **must** only be

called when the state of the detector is XR_MARKER_DETECTOR_STATUS_READY_ML. If the marker does not have an associated numerical value, the runtime **must** return XR_ERROR_MARKER_DETECTOR_INVALID_DATA_QUERY_ML.

If xrGetMarkerDetectorStateML has not been called and returned XR_MARKER_DETECTOR_STATUS_READY_ML since the last invocation of xrSnapshotMarkerDetectorML, the runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

The runtime **must** return XR_ERROR_MARKER_INVALID_ML if the marker atom is invalid.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to calling xrGetMarkerNumberML
- markerDetector **must** be a valid XrMarkerDetectorML handle
- number **must** be a pointer to a uint64_t value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_DETECTOR_INVALID_DATA_QUERY_ML
- XR_ERROR_MARKER_INVALID_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetMarkerStringML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkerStringML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerML                                  marker,
    uint32_t                                    bufferCapacityInput,
    uint32_t*                                   bufferCountOutput,
    char*                                       buffer);
```

Parameter Descriptions

- `markerDetector` is the detector object to retrieve marker information from.
- `marker` is the marker atom to be examined.
- `bufferCapacityInput` is the capacity of the buffer, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` is a pointer to the count of characters written to buffer (including the terminating '\0'), or a pointer to the required capacity in the case that bufferCapacityInput is insufficient.
- `buffer` is a pointer to an application-allocated buffer that **should** be filled with the QR code's contents. It **can** be NULL if bufferCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

Get the string value of a marker, such as the QR encoded string. xrCreateMarkerSpaceML **must** only be called when the state of the detector is `XR_MARKER_DETECTOR_STATUS_READY_ML`.

If the marker does not have an associated string value, the runtime **must** return `XR_ERROR_MARKER_DETECTOR_INVALID_DATA_QUERY_ML`.

If xrGetMarkerDetectorStateML has not been called and returned `XR_MARKER_DETECTOR_STATUS_READY_ML` since the last invocation of xrSnapshotMarkerDetectorML, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

This function follows the two-call idiom for filling the `buffer`.

The runtime **must** return `XR_ERROR_MARKER_INVALID_ML` if the marker atom is invalid.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to calling xrGetMarkerStringML
- markerDetector **must** be a valid XrMarkerDetectorML handle
- bufferCountOutput **must** be a pointer to a uint32_t value
- If bufferCapacityInput is not 0, buffer **must** be a pointer to an array of bufferCapacityInput char values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_DETECTOR_INVALID_DATA_QUERY_ML
- XR_ERROR_MARKER_INVALID_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetMarkerReprojectionErrorML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkerReprojectionErrorML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerML                                  marker,
    float*                                      reprojectionErrorMeters);
```

Parameter Descriptions

- `markerDetector` is the detector object to retrieve marker information from.
- `marker` is the marker atom to be examined.
- `reprojectionErrorMeters` points to a `float` in which the estimated reprojection error in meters is returned.

Get the reprojection error of a marker, only available for certain types of markers. **must** only be called when the state of the detector is `XR_MARKER_DETECTOR_STATUS_READY_ML`.

If xrGetMarkerDetectorStateML has not been called and returned `XR_MARKER_DETECTOR_STATUS_READY_ML` since the last invocation of xrSnapshotMarkerDetectorML, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

A high reprojection error means that the estimated pose of the marker does not match well with the 2D detection on the processed video frame and thus the pose **may** be inaccurate. The error is given in meters, representing the displacement between real marker and its estimated pose. This means this is a normalized number, independent of marker distance or length.

The runtime **must** return `XR_ERROR_MARKER_INVALID_ML` if the marker atom is invalid.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrGetMarkerReprojectionErrorML
- `markerDetector` **must** be a valid XrMarkerDetectorML handle
- `reprojectionErrorMeters` **must** be a pointer to a `float` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_INVALID_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetMarkerLengthML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrGetMarkerLengthML(
    XrMarkerDetectorML                          markerDetector,
    XrMarkerML                                  marker,
    float*                                      meters);
```

Parameter Descriptions

- markerDetector is the detector object to retrieve marker information from.
- marker is the marker atom to be examined.
- meters points to a float in which the size per side of the queried marker is returned.

Get the size of the marker, defined as the length in meters per side. If the application created the detector while passing in a XrMarkerDetectorSizeInfoML, this query **may** be redundant. xrGetMarkerLengthML is primarily intended to query for a runtime estimated size when an application did not indicate the expected size via XrMarkerDetectorSizeInfoML.

xrGetMarkerLengthML **must** only be called when the state of the detector is XR_MARKER_DETECTOR_STATUS_READY_ML. If xrGetMarkerDetectorStateML has not been called and returned XR_MARKER_DETECTOR_STATUS_READY_ML since the last invocation of xrSnapshotMarkerDetectorML, the

runtime **must** return XR_ERROR_CALL_ORDER_INVALID.

The runtime **must** return XR_ERROR_MARKER_INVALID_ML if the marker atom is invalid.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to calling xrGetMarkerLengthML
- markerDetector **must** be a valid XrMarkerDetectorML handle
- meters **must** be a pointer to a float value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_INVALID_ML
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.180.5. Getting an XrSpace from Marker Results

The xrCreateMarkerSpaceML function is defined as:

```
// Provided by XR_ML_marker_understanding
XrResult xrCreateMarkerSpaceML(
    XrSession                                   session,
    const XrMarkerSpaceCreateInfoML*            createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- `session` is the session that will own the created space.
- `createInfo` is a pointer to the XrMarkerSpaceCreateInfoML used to specify the space creation parameters.
- `space` points to an XrSpace handle in which the resulting space is returned.

Creates an XrSpace from a currently snapshotted marker. The space **may** still be used even if the marker is later not in the FOV, or even if the marker detector has been destroyed. In such a scenario, the `XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT` and `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` **must** be false, but `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_SPACE_LOCATION_ORIENTATION_VALID_BIT` **may** be set as appropriate to the last known location.

Once an application has created a space, it **may** stop calling xrSnapshotMarkerDetectorML, and the position of the marker **must** still be updated by the runtime whenever it is aware of a more up to date location.

If a runtime is unable to spatially locate a snapshotted marker, it **may** return `XR_ERROR_MARKER_DETECTOR_LOCATE_FAILED_ML`. This is most likely to happen if significant time has passed since the snapshot of markers was acquired, and the marker in question is no longer in the user's FOV. Thus, an application **should** call xrCreateMarkerSpaceML immediately after examining a snapshot, but **should** also be prepared to try again if needed.

must only be called when the state of the detector is `XR_MARKER_DETECTOR_STATUS_READY_ML`.

If xrGetMarkerDetectorStateML has not been called and returned `XR_MARKER_DETECTOR_STATUS_READY_ML` since the last invocation of xrSnapshotMarkerDetectorML, the runtime **must** return `XR_ERROR_CALL_ORDER_INVALID`.

`session` must be the same session that created the XrMarkerSpaceCreateInfoML::`markerDetector`, else the runtime **must** return `XR_ERROR_HANDLE_INVALID`.

The runtime **must** return `XR_ERROR_MARKER_INVALID_ML` if the marker atom is invalid.

The XrSpace origin **must** be located at the marker's center. The X-Y plane of the XrSpace **must** be aligned with the plane of the marker with the positive Z axis coming out of the marker face.

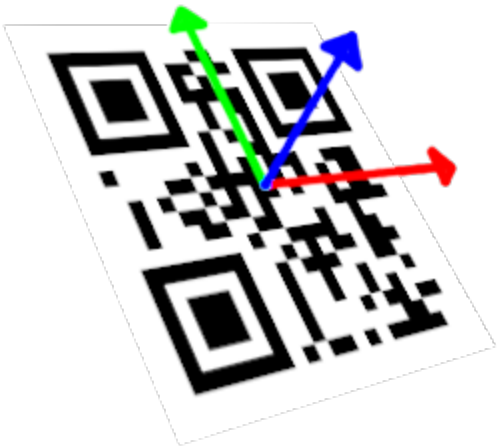

Figure 36. QR code marker with axis

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to calling xrCreateMarkerSpaceML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrMarkerSpaceCreateInfoML structure
- `space` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MARKER_DETECTOR_LOCATE_FAILED_ML
- XR_ERROR_MARKER_INVALID_ML
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrMarkerSpaceCreateInfoML structure is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrMarkerSpaceCreateInfoML {
    XrStructureType       type;
    const void*           next;
    XrMarkerDetectorML    markerDetector;
    XrMarkerML            marker;
    XrPosef               poseInMarkerSpace;
} XrMarkerSpaceCreateInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `markerDetector` is the detector object to retrieve marker information from.
- `marker` is the marker atom to be examined.
- `poseInMarkerSpace` is the offset from the marker's origin of the new XrSpace. The origin of each marker is located at its center.

Valid Usage (Implicit)

- The `XR_ML_marker_understanding` extension **must** be enabled prior to using XrMarkerSpaceCreateInfoML
- `type` **must** be `XR_TYPE_MARKER_SPACE_CREATE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `markerDetector` **must** be a valid XrMarkerDetectorML handle

12.180.6. Example code for locating a marker

The following example code demonstrates how to detect a marker relative to a local space, and query the contents.

```
XrInstance instance;  // previously initialized
XrSystemId systemId;  // previously initialized
XrSession session;    // previously initialized
XrSpace localSpace;   // previously initialized, e.g. from
                      // XR_REFERENCE_SPACE_TYPE_LOCAL
XrSpace viewSpace;    // previously initialized, e.g. from
                      // XR_REFERENCE_SPACE_TYPE_VIEW

// The function pointers are previously initialized using
// xrGetInstanceProcAddr.
PFN_xrCreateMarkerDetectorML xrCreateMarkerDetectorML; // previously initialized
PFN_xrDestroyMarkerDetectorML xrDestroyMarkerDetectorML; // previously initialized
PFN_xrSnapshotMarkerDetectorML xrSnapshotMarkerDetectorML; // previously initialized
PFN_xrGetMarkerDetectorStateML xrGetMarkerDetectorStateML; // previously initialized
PFN_xrGetMarkersML xrGetMarkersML; // previously initialized
PFN_xrGetMarkerReprojectionErrorML xrGetMarkerReprojectionErrorML; // previously
initialized
```

```
PFN_xrGetMarkerLengthML xrGetMarkerLengthML; // previously initialized
PFN_xrGetMarkerNumberML xrGetMarkerNumberML; // previously initialized
PFN_xrGetMarkerStringML xrGetMarkerStringML; // previously initialized
PFN_xrCreateMarkerSpaceML xrCreateMarkerSpaceML; // previously initialized

// Initialize marker detector handle
XrMarkerDetectorML markerDetector = XR_NULL_HANDLE;

XrMarkerDetectorCreateInfoML createInfo{ XR_TYPE_MARKER_DETECTOR_CREATE_INFO_ML };
createInfo.profile = XR_MARKER_DETECTOR_PROFILE_CUSTOM_ML;
createInfo.markerType = XR_MARKER_TYPE_ARUCO_ML;

// Passing a non-custom profile allows you to leave next == nullptr
XrMarkerDetectorCustomProfileInfoML customProfile{
XR_TYPE_MARKER_DETECTOR_CUSTOM_PROFILE_INFO_ML };
customProfile.fpsHint = XR_MARKER_DETECTOR_FPS_LOW_ML;
customProfile.resolutionHint = XR_MARKER_DETECTOR_RESOLUTION_HIGH_ML;
customProfile.cameraHint = XR_MARKER_DETECTOR_CAMERA_RGB_CAMERA_ML;
customProfile.cornerRefineMethod = XR_MARKER_DETECTOR_CORNER_REFINE_METHOD_CONTOUR_ML;
customProfile.useEdgeRefinement = true;
customProfile.fullAnalysisIntervalHint =
XR_MARKER_DETECTOR_FULL_ANALYSIS_INTERVAL_SLOW_ML;

createInfo.next = &customProfile;

// Elect to use ArUco marker tracking, providing required dictionary
XrMarkerDetectorArucoInfoML arucoCreateInfo{ XR_TYPE_MARKER_DETECTOR_ARUCO_INFO_ML };
arucoCreateInfo.arucoDict = XR_MARKER_ARUCO_DICT_6X6_100_ML;

customProfile.next = &arucoCreateInfo;

// Specify the size of the marker to improve tracking quality
XrMarkerDetectorSizeInfoML sizeCreateInfo{ XR_TYPE_MARKER_DETECTOR_SIZE_INFO_ML };
sizeCreateInfo.markerLength = 0.2f;

arucoCreateInfo.next = &sizeCreateInfo;

CHK_XR(xrCreateMarkerDetectorML(session, &createInfo, &markerDetector));

bool queryRunning = false;

std::unordered_map <uint64_t, XrSpace> markerSpaceMap;

auto processMarkers = [&]() {
    // 2 call idiom to get the markers from runtime
    uint32_t markerCount;
    CHK_XR(xrGetMarkersML(markerDetector, 0, &markerCount, nullptr));
```

```
    std::vector<XrMarkerML> markers(markerCount);
    CHK_XR(xrGetMarkersML(markerDetector, markerCount, &markerCount, markers.data()));

    for(uint32_t i = 0; i < markerCount; ++i)
    {
        uint64_t number;
        CHK_XR(xrGetMarkerNumberML(markerDetector, markers[i], &number));
        // Track every marker we find.
        if(markerSpaceMap.find(number) == markerSpaceMap.end())
        {
            // New entry
            XrSpace space;
            XrMarkerSpaceCreateInfoML spaceCreateInfo{
XR_TYPE_MARKER_SPACE_CREATE_INFO_ML };
            spaceCreateInfo.markerDetector = markerDetector;
            spaceCreateInfo.marker = markers[i];
            spaceCreateInfo.poseInMarkerSpace = { {0, 0, 0, 1}, {0, 0, 0} };

            CHK_XR(xrCreateMarkerSpaceML(session, &spaceCreateInfo, &space));
            markerSpaceMap[number] = space;
        }

        // This will not work in this example with ArUco markers, but had we configured
        // a marker with string content such as QR or Code 128, this is how to use it.
        // uint32_t stringSize;
        // CHK_XR(xrGetMarkerStringML(markerDetector, markers[i], 0, &stringSize,
nullptr));
        // std::string markerString(stringSize, ' ');
        // CHK_XR(xrGetMarkerStringML(markerDetector, markers[i], stringSize,
&stringSize, markerString.data()));
    }
};

// Must be initialized to true, otherwise in the loop below, there will
// be an XR_ERROR_CALL_ORDER_INVALID due to xrSnapshotMarkerDetectorML
// not being called first
bool isReadyForSnapshot = true;

while (1) {
    // ...
    // For every frame in frame loop
    // ...

    // We have this if/else block set up so that xrSnapshotMarkerDetectorML
    // is not captured per frame since the marker detector snapshot
    // might still be in the midst of being processed by the runtime
    if (isReadyForSnapshot) {
      // Call the first snapshot
```

```
      XrMarkerDetectorSnapshotInfoML detectorInfo{
XR_TYPE_MARKER_DETECTOR_SNAPSHOT_INFO_ML };
      CHK_XR(xrSnapshotMarkerDetectorML(markerDetector, &detectorInfo));
      isReadyForSnapshot = false;
    } else {
      XrMarkerDetectorStateML state{ XR_TYPE_MARKER_DETECTOR_STATE_ML };
      CHK_XR(xrGetMarkerDetectorStateML(markerDetector, &state));
      // For simplicity, this example will assume that the marker detector will not
      // be in an erroneous state
      if (state.state == XR_MARKER_DETECTOR_STATUS_READY_ML) {
        processMarkers();
        isReadyForSnapshot = true;
      }
    }

    // Draw the markers as needed from markerSpaceMap.
    // drawMarkers(markerSpaceMap);

    // ...
    // ...
}
// Cleanup
CHK_XR(xrDestroyMarkerDetectorML(markerDetector));
```

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_MARKER_UNDERSTANDING_PROPERTIES_ML
- XR_TYPE_MARKER_DETECTOR_CREATE_INFO_ML
- XR_TYPE_MARKER_DETECTOR_ARUCO_INFO_ML
- XR_TYPE_MARKER_DETECTOR_APRIL_TAG_INFO_ML
- XR_TYPE_MARKER_DETECTOR_CUSTOM_PROFILE_INFO_ML
- XR_TYPE_MARKER_DETECTOR_SNAPSHOT_INFO_ML
- XR_TYPE_MARKER_DETECTOR_STATE_ML
- XR_TYPE_MARKER_SPACE_CREATE_INFO_ML

the XrResult enumeration is extended with:

- XR_ERROR_MARKER_DETECTOR_PERMISSION_DENIED_ML
- XR_ERROR_MARKER_DETECTOR_LOCATE_FAILED_ML
- XR_ERROR_MARKER_DETECTOR_INVALID_DATA_QUERY_ML

- XR_ERROR_MARKER_DETECTOR_INVALID_CREATE_INFO_ML
- XR_ERROR_MARKER_INVALID_ML

New Structures

The XrSystemMarkerUnderstandingPropertiesML structure is defined as:

```
// Provided by XR_ML_marker_understanding
typedef struct XrSystemMarkerUnderstandingPropertiesML {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsMarkerUnderstanding;
} XrSystemMarkerUnderstandingPropertiesML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- supportsMarkerUnderstanding indicates whether marker detection and tracking is supported by this system.

Valid Usage (Implicit)

- The XR_ML_marker_understanding extension **must** be enabled prior to using XrSystemMarkerUnderstandingPropertiesML
- type **must** be XR_TYPE_SYSTEM_MARKER_UNDERSTANDING_PROPERTIES_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.181.1. Overview

Spatial anchors are XrSpace entities tied to a physical location. This allows the developer to place virtual content in real world locations.

The runtime **should** then adjust the XrSpace over time as needed, independently of all other spaces and anchors, to ensure that it maintains its original mapping to the real world.

Caution

If head pose is lost and regained, spatial anchors **may** also be lost. It is therefore strongly recommended that once an anchor is created, it is also persisted using the `XR_ML_spatial_anchors_storage` extension.

Permissions

Android applications **must** have the com.magicleap.permission.SPATIAL_ANCHOR permission listed in their manifest to use this extension. (protection level: normal)

12.181.2. Begin spatial anchor creation

xrCreateSpatialAnchorsAsyncML is used to create spatial anchors. It **can** create anchors in different ways depending on the parameter passed in. This extension defines one way to create single anchors using the XrSpatialAnchorsCreateInfoFromPoseML structure. `XR_ML_spatial_anchors_storage` extends

this to also create spatial anchors from a persistent storage using their XrUuidEXT.

The xrCreateSpatialAnchorsAsyncML function is defined as:

```
// Provided by XR_ML_spatial_anchors
XrResult xrCreateSpatialAnchorsAsyncML(
    XrSession                                       session,
    const XrSpatialAnchorsCreateInfoBaseHeaderML* createInfo,
    XrFutureEXT*                                    future);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `createInfo` is a pointer to an XrSpatialAnchorsCreateInfoBaseHeaderML derived structure.
- `future` is a pointer to an `XrFutureEXT`.

This function starts an asynchronous spatial anchor creation. Call one of the xrPollFutureEXT functions to check the ready state on the future. Once the future is in ready state, call xrCreateSpatialAnchorsCompleteML to retrieve the results.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors` extension **must** be enabled prior to calling xrCreateSpatialAnchorsAsyncML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialAnchorsCreateInfoBaseHeaderML-based structure. See also: XrSpatialAnchorsCreateInfoFromPoseML, XrSpatialAnchorsCreateInfoFromUuidsML
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_ANCHORS_PERMISSION_DENIED_ML
- XR_ERROR_SPATIAL_ANCHORS_SPACE_NOT_LOCATABLE_ML
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorsCreateInfoFromPoseML structure **can** be used to create an spatial anchor from a pose in an XrSpace.

```
// Provided by XR_ML_spatial_anchors
typedef struct XrSpatialAnchorsCreateInfoFromPoseML {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrPosef            poseInBaseSpace;
    XrTime             time;
} XrSpatialAnchorsCreateInfoFromPoseML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `baseSpace` XrSpace used to calculate the position of the anchor.
- `poseInBaseSpace` XrPosef of the anchor to create.
- `time` `XrTime` to resolve the pose in the base space.

Note that xrCreateSpatialAnchorsCompleteML **must** be called with XrCreateSpatialAnchorsCompletionML::`spaceCount` set to 1 when using XrSpatialAnchorsCreateInfoFromPoseML to create a spatial anchor.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors` extension **must** be enabled prior to using XrSpatialAnchorsCreateInfoFromPoseML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_POSE_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The base structure for XrSpatialAnchorsCreateInfoFromPoseML is XrSpatialAnchorsCreateInfoBaseHeaderML.

The XrSpatialAnchorsCreateInfoBaseHeaderML structure is defined as:

```
// Provided by XR_ML_spatial_anchors
typedef struct XrSpatialAnchorsCreateInfoBaseHeaderML {
    XrStructureType    type;
    const void*        next;
} XrSpatialAnchorsCreateInfoBaseHeaderML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

This structure is not directly used in the API, please see XrSpatialAnchorsCreateInfoFromPoseML for an example of a child structure.

Valid Usage (Implicit)

- The XR_ML_spatial_anchors extension **must** be enabled prior to using XrSpatialAnchorsCreateInfoBaseHeaderML
- type **must** be one of the following XrStructureType values: XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_POSE_ML, XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_UUIDS_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.181.3. Complete spatial anchor operation

xrCreateSpatialAnchorsCompleteML completes the asynchronous operation started by xrCreateSpatialAnchorsAsyncML. The XrFutureEXT **must** be in ready state before calling the completion function.

The xrCreateSpatialAnchorsCompleteML function is defined as:

```
// Provided by XR_ML_spatial_anchors
XrResult xrCreateSpatialAnchorsCompleteML(
    XrSession                                   session,
    XrFutureEXT                                 future,
    XrCreateSpatialAnchorsCompletionML*         completion);
```

Parameter Descriptions

- session is a handle to an XrSession previously created with xrCreateSession.
- future is the XrFutureEXT to complete.
- completion is a pointer to an XrCreateSpatialAnchorsCompletionML filled in by the runtime.

Valid Usage (Implicit)

- The XR_ML_spatial_anchors extension **must** be enabled prior to calling xrCreateSpatialAnchorsCompleteML
- session **must** be a valid XrSession handle
- completion **must** be a pointer to an XrCreateSpatialAnchorsCompletionML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The completion structure is XrCreateSpatialAnchorsCompletionML.

The XrCreateSpatialAnchorsCompletionML structure is defined as:

```
// Provided by XR_ML_spatial_anchors
typedef struct XrCreateSpatialAnchorsCompletionML {
    XrStructureType    type;
    void*              next;
    XrResult           futureResult;
    uint32_t           spaceCount;
    XrSpace*           spaces;
} XrCreateSpatialAnchorsCompletionML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `futureResult` is the XrResult of the create spatial anchor operation.
- `spaceCount` is the number of elements in the `spaces` array. This **must** match the number of spaces requested to be created.
- `spaces` is an array of XrSpace values to populate with the results of the anchor creation. If creation failed, the XrSpace values **must** be set to XR_NULL_HANDLE.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_SPATIAL_ANCHORS_SPACE_NOT_LOCATABLE_ML`
- `XR_ERROR_SPATIAL_ANCHORS_OUT_OF_MAP_BOUNDS_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors` extension **must** be enabled prior to using XrCreateSpatialAnchorsCompletionML
- `type` **must** be `XR_TYPE_CREATE_SPATIAL_ANCHORS_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `futureResult` is not `0`, `futureResult` **must** be a valid XrResult value
- If `spaceCount` is not `0`, `spaces` **must** be a pointer to an array of `spaceCount` XrSpace handles

12.181.4. Retrieve spatial anchor state

Spatial anchor state **can** be queried using xrGetSpatialAnchorStateML.

The xrGetSpatialAnchorStateML function is defined as:

```
// Provided by XR_ML_spatial_anchors
XrResult xrGetSpatialAnchorStateML(
    XrSpace                                     anchor,
    XrSpatialAnchorStateML*                     state);
```

Parameter Descriptions

- `anchor` is a handle to an XrSpace corresponding to a spatial anchor.
- `state` is a pointer to an XrSpatialAnchorStateML structure to populate with the spatial anchor state.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the XrSpace is not an spatial anchor.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors` extension **must** be enabled prior to calling xrGetSpatialAnchorStateML
- `anchor` **must** be a valid XrSpace handle
- `state` **must** be a pointer to an XrSpatialAnchorStateML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorStateML structure is defined as:

```
// Provided by XR_ML_spatial_anchors
typedef struct XrSpatialAnchorStateML {
    XrStructureType                type;
    void*                          next;
    XrSpatialAnchorConfidenceML    confidence;
} XrSpatialAnchorStateML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- confidence is the XrSpatialAnchorConfidenceML of the anchor.

Valid Usage (Implicit)

- The XR_ML_spatial_anchors extension **must** be enabled prior to using XrSpatialAnchorStateML
- type **must** be XR_TYPE_SPATIAL_ANCHOR_STATE_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If confidence is not 0, confidence **must** be a valid XrSpatialAnchorConfidenceML value

```
// Provided by XR_ML_spatial_anchors
typedef enum XrSpatialAnchorConfidenceML {
    XR_SPATIAL_ANCHOR_CONFIDENCE_LOW_ML = 0,
    XR_SPATIAL_ANCHOR_CONFIDENCE_MEDIUM_ML = 1,
    XR_SPATIAL_ANCHOR_CONFIDENCE_HIGH_ML = 2,
    XR_SPATIAL_ANCHOR_CONFIDENCE_MAX_ENUM_ML = 0x7FFFFFFF
} XrSpatialAnchorConfidenceML;
```

Enum	Description
XR_SPATIAL_ANCHOR_CONFIDENCE_LOW_ML	Low quality, this anchor can be expected to move significantly.
XR_SPATIAL_ANCHOR_CONFIDENCE_MEDIUM_ML	Medium quality, this anchor may move slightly.
XR_SPATIAL_ANCHOR_CONFIDENCE_HIGH_ML	High quality, this anchor is stable and suitable for digital content attachment.

12.181.5. Example code

This code shows how to create a spatial anchor in a synchronous manner. This **can** be changed to be completely asynchronous by changing the waitInfo.duration to 0 and checking it during the frame loop until the function returns ready.

```
XrInstance instance;                // previously initialized
XrSession session;                  // previously initialized

// these are setup to match the location and time
// of the position in the world you wish to set the
// spatial anchor for.
XrSpace baseSpace;                  // previously initialized
XrTime time;                        // previously initialized
XrPosef pose;                       // previously initialized

// Get function pointer for xrCreateSpatialAnchorsAsyncML
```

```
PFN_xrCreateSpatialAnchorsAsyncML xrCreateSpatialAnchorsAsyncML = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateSpatialAnchorsAsyncML",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrCreateSpatialAnchorsAsyncML)))

// Get function pointer for xrCreateSpatialAnchorsCompleteML
PFN_xrCreateSpatialAnchorsCompleteML xrCreateSpatialAnchorsCompleteML = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateSpatialAnchorsCompleteML",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrCreateSpatialAnchorsCompleteML)));

// Get function pointer for xrPollFutureEXT
PFN_xrPollFutureEXT xrPollFutureEXT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrPollFutureEXT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrPollFutureEXT)));

XrFutureEXT future {XR_NULL_FUTURE_EXT};
XrSpatialAnchorsCreateInfoFromPoseML createInfo {
    .type = XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_POSE_ML,
    .baseSpace = baseSpace,
    .poseInBaseSpace = pose,
    .time = time,
};

CHK_XR(xrCreateSpatialAnchorsAsyncML(session, reinterpret_cast<const
XrSpatialAnchorsCreateInfoBaseHeaderML*>(&createInfo), &future));

XrFuturePollInfoEXT pollInfo {
    .type = XR_TYPE_FUTURE_POLL_INFO_EXT,
    .future = future,
};
XrFuturePollResultEXT pollResult {
    .type = XR_TYPE_FUTURE_POLL_RESULT_EXT,
    .state = XR_FUTURE_STATE_PENDING_EXT,
};

while(pollResult.state==XR_FUTURE_STATE_PENDING_EXT) {
  // Ideally this check is done in your game loop
  // instead of busy waiting, this is just an
  // example.
  // If you do choose busy wait sleep to avoid
  // CPU overloading.
  CHK_XR(xrPollFutureEXT(instance, &pollInfo, &pollResult));
}

XrSpace anchor;
```

```
XrCreateSpatialAnchorsCompletionML completion {
    .type = XR_TYPE_CREATE_SPATIAL_ANCHORS_COMPLETION_ML,
    .spaceCount = 1,
    .spaces = &anchor,
};

CHK_XR(xrCreateSpatialAnchorsCompleteML(session, future, &completion));
// Check the future completion result as well!
CHK_XR(completion.futureResult);

// Now the anchor is usable!
```

12.181.6. New Commands

- xrCreateSpatialAnchorsAsyncML
- xrCreateSpatialAnchorsCompleteML
- xrGetSpatialAnchorStateML

12.181.7. New Structures

- XrCreateSpatialAnchorsCompletionML
- XrSpatialAnchorStateML
- XrSpatialAnchorsCreateInfoBaseHeaderML
- XrSpatialAnchorsCreateInfoFromPoseML

12.181.8. New Enums

- XrSpatialAnchorConfidenceML

12.181.9. New Enum Constants

- XR_ML_SPATIAL_ANCHORS_EXTENSION_NAME
- XR_ML_spatial_anchors_SPEC_VERSION
- Extending XrResult:
  - XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML
  - XR_ERROR_SPATIAL_ANCHORS_OUT_OF_MAP_BOUNDS_ML
  - XR_ERROR_SPATIAL_ANCHORS_PERMISSION_DENIED_ML
  - XR_ERROR_SPATIAL_ANCHORS_SPACE_NOT_LOCATABLE_ML
- Extending XrStructureType:
  - XR_TYPE_CREATE_SPATIAL_ANCHORS_COMPLETION_ML

- XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_POSE_ML
- XR_TYPE_SPATIAL_ANCHOR_STATE_ML

12.182.1. Overview

This extension allows spatial anchors created by XR_ML_spatial_anchors to be persisted beyond the head pose session.

Spatial anchor management is closely tied to the selected mapping mode on the device. The modes are mutually exclusive and affect the functionality of these APIs. The available mapping modes are:

On-Device Mode

A persistent mode in which anchors are persisted locally and will be available across multiple sessions when localized to the same localization map in which they were published.

AR Cloud Mode

A persistent mode in which anchors are persisted in the cloud environment and will be available across multiple sessions and across multiple devices that are localized to the same localization map in which they were published.

For more details on mapping modes refer to the `XR_ML_localization_map` extension.

Permissions

Android applications **must** have the com.magicleap.permission.SPATIAL_ANCHOR permission listed in their manifest to use this extension. (protection level: normal)

12.182.2. Storage

```
// Provided by XR_ML_spatial_anchors_storage
XR_DEFINE_HANDLE(XrSpatialAnchorsStorageML)
```

The XrSpatialAnchorsStorageML handle maintains the connection with the backend service. This **may** be on device or in cloud depending on the localization map that is active. Use the `XR_ML_localization_map` extension to deduce the current mode if the application needs to know this.

The XrSpatialAnchorsStorageML handle represents the resources for storing spatial anchors.

The xrCreateSpatialAnchorsStorageML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrCreateSpatialAnchorsStorageML(
    XrSession                                   session,
    const XrSpatialAnchorsCreateStorageInfoML*  createInfo,
    XrSpatialAnchorsStorageML*                  storage);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `createInfo` is a pointer to an XrSpatialAnchorsCreateInfoBaseHeaderML derived structure.
- `storage` is a pointer to an XrSpatialAnchorsStorageML where the created storage is returned.

The xrCreateSpatialAnchorsStorageML function is used to create a XrSpatialAnchorsStorageML.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrCreateSpatialAnchorsStorageML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialAnchorsCreateStorageInfoML structure
- `storage` **must** be a pointer to an XrSpatialAnchorsStorageML handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_ANCHORS_PERMISSION_DENIED_ML
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorsCreateStorageInfoML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsCreateStorageInfoML {
    XrStructureType    type;
    const void*        next;
} XrSpatialAnchorsCreateStorageInfoML;
```

Currently no extra information is needed to create this structure.

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsCreateStorageInfoML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_CREATE_STORAGE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrDestroySpatialAnchorsStorageML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrDestroySpatialAnchorsStorageML(
    XrSpatialAnchorsStorageML                   storage);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML to destroy.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrDestroySpatialAnchorsStorageML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle

Thread Safety

- Access to `storage`, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE

12.182.3. Query Stored Anchors

To find out which spatial anchors are stored near a certain XrPosef, this extension provides a query system. This function is asynchronous and uses the XR_EXT_future extension.

The xrQuerySpatialAnchorsAsyncML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrQuerySpatialAnchorsAsyncML(
    XrSpatialAnchorsStorageML                    storage,
    const XrSpatialAnchorsQueryInfoBaseHeaderML* queryInfo,
    XrFutureEXT*                                 future);
```

Parameter Descriptions

- storage is the XrSpatialAnchorsStorageML to use.
- queryInfo is the XrSpatialAnchorsQueryInfoBaseHeaderML structure used to define the query. XrSpatialAnchorsQueryInfoRadiusML allows querying around a pose.
- future is a pointer the created XrFutureEXT.

If the space was not locatable during the query the runtime **must** return XR_ERROR_SPACE_NOT_LOCATABLE_EXT in XrSpatialAnchorsQueryCompletionML::futureResult.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrQuerySpatialAnchorsAsyncML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `queryInfo` **must** be a pointer to a valid XrSpatialAnchorsQueryInfoBaseHeaderML-based structure. See also: XrSpatialAnchorsQueryInfoRadiusML
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ANCHORS_SPACE_NOT_LOCATABLE_ML`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorsQueryInfoRadiusML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsQueryInfoRadiusML {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrVector3f         center;
    XrTime             time;
    float              radius;
} XrSpatialAnchorsQueryInfoRadiusML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `baseSpace` is the XrSpace to create the anchor relative to.
- `center` is the center of the query relative to the baseSpace.
- `time` is the time at which the pose **should** be resolved.
- `radius` is the radius of the search area in meters.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsQueryInfoRadiusML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_QUERY_INFO_RADIUS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The XrSpatialAnchorsQueryInfoBaseHeaderML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsQueryInfoBaseHeaderML {
    XrStructureType    type;
    const void*        next;
} XrSpatialAnchorsQueryInfoBaseHeaderML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsQueryInfoBaseHeaderML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_QUERY_INFO_RADIUS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrQuerySpatialAnchorsCompleteML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrQuerySpatialAnchorsCompleteML(
    XrSpatialAnchorsStorageML                   storage,
    XrFutureEXT                                 future,
    XrSpatialAnchorsQueryCompletionML*          completion);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML used to start the query.
- `future` is the `XrFutureEXT` of the future to complete.
- `completion` is a pointer to an XrSpatialAnchorsQueryCompletionML structure containing the result of the operation.

Once the `XrFutureEXT` has completed xrQuerySpatialAnchorsCompleteML **must** be called to retrieve the XrUuidEXT values of the found anchors.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrQuerySpatialAnchorsCompleteML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `completion` **must** be a pointer to an XrSpatialAnchorsQueryCompletionML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorsQueryCompletionML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsQueryCompletionML {
    XrStructureType    type;
    void*              next;
    XrResult           futureResult;
    uint32_t           uuidCapacityInput;
    uint32_t           uuidCountOutput;
    XrUuidEXT*         uuids;
} XrSpatialAnchorsQueryCompletionML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `futureResult` is the XrResult of the asynchronous operation.
- `uuidCapacityInput` is the capacity of the `uuids` array, or 0 to indicate a request to retrieve the required capacity.
- `uuidCountOutput` is the number of elements populated in `uuids`, or the required capacity in the case that `uuidCapacityInput` is insufficient.
- `uuids` is an array of XrUuidEXT.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_VALIDATION_FAILURE`
- `XR_ERROR_SPACE_NOT_LOCATABLE_EXT`
- `XR_ERROR_SPATIAL_ANCHORS_SPACE_NOT_LOCATABLE_ML`
- `XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsQueryCompletionML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_QUERY_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `futureResult` is not `0`, `futureResult` **must** be a valid XrResult value
- If `uuidCapacityInput` is not `0`, `uuids` **must** be a pointer to an array of `uuidCapacityInput` XrUuidEXT structures

12.182.4. Publish Anchors

If the application needs to persist an anchor beyond the current head pose session it **should** publish the anchor. Publishing is an asynchronous operation and **can** publish multiple anchors at the same time.

The xrPublishSpatialAnchorsAsyncML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrPublishSpatialAnchorsAsyncML(
    XrSpatialAnchorsStorageML                   storage,
    const XrSpatialAnchorsPublishInfoML*        publishInfo,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML to use.
- `publishInfo` is the XrSpatialAnchorsPublishInfoML structure use to specify the anchors to publish.
- `future` is a pointer the created `XrFutureEXT`.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrPublishSpatialAnchorsAsyncML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `publishInfo` **must** be a pointer to a valid XrSpatialAnchorsPublishInfoML structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorsPublishInfoML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsPublishInfoML {
    XrStructureType    type;
    const void*        next;
    uint32_t           anchorCount;
    const XrSpace*     anchors;
    uint64_t           expiration;
} XrSpatialAnchorsPublishInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `anchorCount` is the number of anchors in the anchors array.
- `anchors` is an array of XrSpace.
- `expiration` is an `uint64_t`, is the time in **seconds** since epoch after which these anchors **may** expire. The system **may** retain the anchors longer but **should** retain the anchors at least until this timestamp. Use 0 or XR_INFINITE_DURATION to create an anchor that does not expire.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsPublishInfoML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_PUBLISH_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `anchors` **must** be a pointer to an array of `anchorCount` valid XrSpace handles
- The `anchorCount` parameter **must** be greater than `0`

Once the `XrFutureEXT` has completed xrPublishSpatialAnchorsCompleteML **must** be called to retrieve the XrUuidEXT values of the published anchors.

The xrPublishSpatialAnchorsCompleteML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrPublishSpatialAnchorsCompleteML(
    XrSpatialAnchorsStorageML                   storage,
    XrFutureEXT                                 future,
    XrSpatialAnchorsPublishCompletionML*        completion);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML used to start the publish operation.
- `future` is the `XrFutureEXT` of the future to complete.
- `completion` is a pointer to a XrSpatialAnchorsPublishCompletionML structure containing the result of the operation.

Valid Usage (Implicit)

- The XR_ML_spatial_anchors_storage extension **must** be enabled prior to calling xrPublishSpatialAnchorsCompleteML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `completion` **must** be a pointer to an XrSpatialAnchorsPublishCompletionML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorsPublishCompletionML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsPublishCompletionML {
    XrStructureType    type;
    void*              next;
    XrResult           futureResult;
    uint32_t           uuidCount;
    XrUuidEXT*         uuids;
} XrSpatialAnchorsPublishCompletionML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `futureResult` is the XrResult of the asynchronous operation.
- `uuidCount` is the capacity of the `uuids` array and **must** match the number of anchors passed to xrPublishSpatialAnchorsAsyncML
- `uuids` is an array of XrUuidEXT.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_VALIDATION_FAILURE`
- `XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML`
- `XR_ERROR_SPATIAL_ANCHORS_OUT_OF_MAP_BOUNDS_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsPublishCompletionML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_PUBLISH_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpatialAnchorsPublishCompletionDetailsML
- `futureResult` **must** be a valid XrResult value
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

The XrSpatialAnchorsPublishCompletionDetailsML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsPublishCompletionDetailsML {
    XrStructureType                       type;
    void*                                 next;
    uint32_t                              resultCount;
    XrSpatialAnchorCompletionResultML*    results;
} XrSpatialAnchorsPublishCompletionDetailsML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `resultCount` is the capacity of the `results` array and **must** match the number of anchors passed to xrPublishSpatialAnchorsAsyncML.
- `results` is the per UUID status of the publish operation. The order of results in this array correspond to the async request order.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsPublishCompletionDetailsML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_PUBLISH_COMPLETION_DETAILS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `results` **must** be a pointer to an array of `resultCount` XrSpatialAnchorCompletionResultML structures
- The `resultCount` parameter **must** be greater than `0`

The XrSpatialAnchorCompletionResultML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorCompletionResultML {
    XrUuidEXT    uuid;
    XrResult     result;
} XrSpatialAnchorCompletionResultML;
```

Member Descriptions

- `uuid` is the UUID of the anchor.
- `result` is the result of the operation.

Anchor Operation Result Codes

`result` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_VALIDATION_FAILURE`
- `XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML`
- `XR_ERROR_SPATIAL_ANCHORS_OUT_OF_MAP_BOUNDS_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorCompletionResultML
- `result` **must** be a valid XrResult value

12.182.5. Delete Published Anchors

To delete anchors from the storage, xrDeleteSpatialAnchorsAsyncML **can** be used.

The xrDeleteSpatialAnchorsAsyncML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrDeleteSpatialAnchorsAsyncML(
    XrSpatialAnchorsStorageML                   storage,
    const XrSpatialAnchorsDeleteInfoML*         deleteInfo,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML to use.
- `deleteInfo` is the XrSpatialAnchorsDeleteInfoML structure used to specify the anchors to delete.
- `future` is a pointer the created `XrFutureEXT`.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrDeleteSpatialAnchorsAsyncML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `deleteInfo` **must** be a pointer to a valid XrSpatialAnchorsDeleteInfoML structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorsDeleteInfoML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsDeleteInfoML {
    XrStructureType     type;
    const void*         next;
    uint32_t            uuidCount;
    const XrUuidEXT*    uuids;
} XrSpatialAnchorsDeleteInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuidCount` is the number of UUIDs in the `uuids` array.
- `uuids` is an array of XrUuidEXT.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsDeleteInfoML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_DELETE_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

Once the `XrFutureEXT` has completed xrPublishSpatialAnchorsCompleteML **must** be called to retrieve the status of the delete operation.

The xrDeleteSpatialAnchorsCompleteML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrDeleteSpatialAnchorsCompleteML(
    XrSpatialAnchorsStorageML                   storage,
    XrFutureEXT                                 future,
    XrSpatialAnchorsDeleteCompletionML*         completion);
```

Member Descriptions

- `storage` is the XrSpatialAnchorsStorageML used to start the publish operation.
- `future` is the `XrFutureEXT` of the future to complete.
- `completion` is a pointer to a XrSpatialAnchorsDeleteCompletionML structure containing the result of the operation.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrDeleteSpatialAnchorsCompleteML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `completion` **must** be a pointer to an XrSpatialAnchorsDeleteCompletionML structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_FUTURE_INVALID_EXT`
- `XR_ERROR_FUTURE_PENDING_EXT`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorsDeleteCompletionML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsDeleteCompletionML {
    XrStructureType    type;
    void*              next;
    XrResult           futureResult;
} XrSpatialAnchorsDeleteCompletionML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `futureResult` is the XrResult of the asynchronous operation.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ANCHORS_ANCHOR_NOT_FOUND_ML`
- `XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsDeleteCompletionML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_DELETE_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpatialAnchorsDeleteCompletionDetailsML
- `futureResult` **must** be a valid XrResult value

The XrSpatialAnchorsDeleteCompletionDetailsML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsDeleteCompletionDetailsML {
    XrStructureType                         type;
    void*                                   next;
    uint32_t                                resultCount;
    XrSpatialAnchorCompletionResultML*      results;
} XrSpatialAnchorsDeleteCompletionDetailsML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `resultCount` is the capacity of the `results` array and **must** match the number of anchors passed to xrDeleteSpatialAnchorsAsyncML
- `results` is the per UUID status of the delete operation. The order of results in this array correspond to the async request order.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsDeleteCompletionDetailsML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_DELETE_COMPLETION_DETAILS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `results` **must** be a pointer to an array of `resultCount` XrSpatialAnchorCompletionResultML structures
- The `resultCount` parameter **must** be greater than `0`

12.182.6. Update Published Anchors Expiration

To update the expiration time on anchors xrUpdateSpatialAnchorsExpirationAsyncML **can** be used.

The xrUpdateSpatialAnchorsExpirationAsyncML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrUpdateSpatialAnchorsExpirationAsyncML(
    XrSpatialAnchorsStorageML                    storage,
    const XrSpatialAnchorsUpdateExpirationInfoML* updateInfo,
    XrFutureEXT*                                 future);
```

Parameter Descriptions

- `storage` is the XrSpatialAnchorsStorageML to use.
- `updateInfo` is a pointer to XrSpatialAnchorsUpdateExpirationInfoML structure used to specify the anchors to update.
- `future` is a pointer to the created `XrFutureEXT`.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrUpdateSpatialAnchorsExpirationAsyncML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `updateInfo` **must** be a pointer to a valid XrSpatialAnchorsUpdateExpirationInfoML structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorsUpdateExpirationInfoML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsUpdateExpirationInfoML {
    XrStructureType     type;
    const void*         next;
    uint32_t            uuidCount;
    const XrUuidEXT*    uuids;
    uint64_t            expiration;
} XrSpatialAnchorsUpdateExpirationInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuidCount` is the number of anchors in the anchors array.
- `uuids` is an array of XrUuidEXT.
- `expiration` is an `uint64_t`, is the time in seconds since epoch after which these anchors **may** expire.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsUpdateExpirationInfoML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_UPDATE_EXPIRATION_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

Once the `XrFutureEXT` has completed xrUpdateSpatialAnchorsExpirationCompleteML **must** be called to retrieve the status of the publish operation.

The xrUpdateSpatialAnchorsExpirationCompleteML function is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
XrResult xrUpdateSpatialAnchorsExpirationCompleteML(
    XrSpatialAnchorsStorageML                    storage,
    XrFutureEXT                                  future,
    XrSpatialAnchorsUpdateExpirationCompletionML* completion);
```

Member Descriptions

- `storage` is the XrSpatialAnchorsStorageML used to start the publish operation.
- `future` is the `XrFutureEXT` of the future to complete.
- `completion` is a pointer to a XrSpatialAnchorsUpdateExpirationCompletionML structure containing the result of the operation.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to calling xrUpdateSpatialAnchorsExpirationCompleteML
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `completion` **must** be a pointer to an XrSpatialAnchorsUpdateExpirationCompletionML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorsUpdateExpirationCompletionML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsUpdateExpirationCompletionML {
    XrStructureType    type;
    void*              next;
    XrResult           futureResult;
} XrSpatialAnchorsUpdateExpirationCompletionML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- futureResult is the XrResult of the asynchronous operation.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ANCHORS_ANCHOR_NOT_FOUND_ML`
- `XR_ERROR_SPATIAL_ANCHORS_NOT_LOCALIZED_ML`

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsUpdateExpirationCompletionML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_UPDATE_EXPIRATION_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpatialAnchorsUpdateExpirationCompletionDetailsML
- `futureResult` **must** be a valid XrResult value

The XrSpatialAnchorsUpdateExpirationCompletionDetailsML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsUpdateExpirationCompletionDetailsML {
    XrStructureType                       type;
    void*                                 next;
    uint32_t                              resultCount;
    XrSpatialAnchorCompletionResultML*    results;
} XrSpatialAnchorsUpdateExpirationCompletionDetailsML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `resultCount` is the capacity of the `results` array and **must** match the number of anchors passed to xrUpdateSpatialAnchorsExpirationAsyncML
- `results` is the per UUID status of the update operation. The order of anchors in this array **must** match the async request order.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsUpdateExpirationCompletionDetailsML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_UPDATE_EXPIRATION_COMPLETION_DETAILS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `results` **must** be a pointer to an array of `resultCount` XrSpatialAnchorCompletionResultML structures
- The `resultCount` parameter **must** be greater than `0`

12.182.7. Create Spatial Anchors from Storage

Spatial anchors **can** be created from the storage XrUuidEXT by passing the XrSpatialAnchorsCreateInfoFromUuidsML structure to xrCreateSpatialAnchorsAsyncML.

The XrSpatialAnchorsCreateInfoFromUuidsML structure is defined as:

```
// Provided by XR_ML_spatial_anchors_storage
typedef struct XrSpatialAnchorsCreateInfoFromUuidsML {
    XrStructureType              type;
    const void*                  next;
    XrSpatialAnchorsStorageML    storage;
    uint32_t                     uuidCount;
    const XrUuidEXT*             uuids;
} XrSpatialAnchorsCreateInfoFromUuidsML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `storage` is the XrSpatialAnchorsStorageML to use.
- `uuidCount` is the number of elements in the uuids array.
- `uuids` is pointer to an array of XrUuidEXT.

The XrSpace handle or handles returned via XrCreateSpatialAnchorsCompletionML::`spaces` **must** be in the same order as `uuids`.

The XrCreateSpatialAnchorsCompletionML::`spaceCount` field **must** match `uuidCount`. If not the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` in XrCreateSpatialAnchorsCompletionML::`futureResult`.

If an anchor with a given UUID is not found, the runtime **must** return XR_NULL_HANDLE for the corresponding XrSpace handle(s) and return `XR_SUCCESS` in XrCreateSpatialAnchorsCompletionML ::`futureResult`.

Valid Usage (Implicit)

- The `XR_ML_spatial_anchors_storage` extension **must** be enabled prior to using XrSpatialAnchorsCreateInfoFromUuidsML
- `type` **must** be `XR_TYPE_SPATIAL_ANCHORS_CREATE_INFO_FROM_UUIDS_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `storage` **must** be a valid XrSpatialAnchorsStorageML handle
- `uuids` **must** be a pointer to an array of `uuidCount` XrUuidEXT structures
- The `uuidCount` parameter **must** be greater than `0`

12.182.8. Examples

This example shows how to persist a list of anchors.

```
XrInstance instance;                // previously initialized
XrSession session;                  // previously initialized

XrSpace anchor1; // previously initialized
XrSpace anchor2; // previously initialized

std::vector<XrSpace> anchors{anchor1, anchor2};
```

```
XrSpatialAnchorsCreateStorageInfoML storageCreateInfo {
    .type = XR_TYPE_SPATIAL_ANCHORS_CREATE_STORAGE_INFO_ML,
};
XrSpatialAnchorsStorageML storage;

CHK_XR(xrCreateSpatialAnchorsStorageML(session, &storageCreateInfo, &storage));

XrSpatialAnchorsPublishInfoML publishInfo {
    .type = XR_TYPE_SPATIAL_ANCHORS_PUBLISH_INFO_ML,
    .anchorCount = static_cast<uint32_t>(anchors.size()),
    .anchors = anchors.data(),
    .expiration = 0,
};

XrFutureEXT future {XR_NULL_FUTURE_EXT};
CHK_XR(xrPublishSpatialAnchorsAsyncML(storage, &publishInfo, &future));

XrFuturePollInfoEXT pollInfo {
    .type = XR_TYPE_FUTURE_POLL_INFO_EXT,
    .future = future,
};
XrFuturePollResultEXT pollResult {
    .type = XR_TYPE_FUTURE_POLL_RESULT_EXT,
    .state = XR_FUTURE_STATE_PENDING_EXT,
};

// Ideally this is done once in your
// game loop instead of a busy wait.
while(pollResult.state==XR_FUTURE_STATE_PENDING_EXT) {
  CHK_XR(xrPollFutureEXT(instance, &pollInfo, &pollResult));
}

std::vector<XrUuidEXT> uuids(anchors.size());
XrSpatialAnchorsPublishCompletionML completion {
    .type = XR_TYPE_SPATIAL_ANCHORS_PUBLISH_COMPLETION_ML,
    .uuidCount = static_cast<uint32_t>(uuids.size()),
    .uuids = uuids.data(),
};
CHK_XR(xrPublishSpatialAnchorsCompleteML(storage, future, &completion));
CHK_XR(completion.futureResult);

// completion.uuid will now contain the UUID of the corresponding spatial anchors.

CHK_XR(xrDestroySpatialAnchorsStorageML(storage));
```

This example shows how to query for anchors.

```
XrTime currentTime;                // previously initialized
XrVector3f center;                      // previously initialized

XrSpatialAnchorsCreateStorageInfoML storageCreateInfo {
    .type = XR_TYPE_SPATIAL_ANCHORS_CREATE_STORAGE_INFO_ML,
};
XrSpatialAnchorsStorageML storage;

CHK_XR(xrCreateSpatialAnchorsStorageML(session, &storageCreateInfo, &storage));

// set up a query around a previously initialized center position with a radius of 10
meters.
XrSpatialAnchorsQueryInfoRadiusML queryInfo {
    .type = XR_TYPE_SPATIAL_ANCHORS_QUERY_INFO_RADIUS_ML,
    .baseSpace = viewSpace, // using viewspace, but can: be any space.
    .center = center,
    .time = currentTime,
    .radius = 10.0f,
};

XrFutureEXT future {XR_NULL_FUTURE_EXT};
CHK_XR(xrQuerySpatialAnchorsAsyncML(storage, reinterpret_cast
<XrSpatialAnchorsQueryInfoBaseHeaderML*>(&queryInfo), &future));

XrFuturePollInfoEXT pollInfo {
    .type = XR_TYPE_FUTURE_POLL_INFO_EXT,
    .future = future,
};
XrFuturePollResultEXT pollResult {
    .type = XR_TYPE_FUTURE_POLL_RESULT_EXT,
    .state = XR_FUTURE_STATE_PENDING_EXT,
};

// Ideally this is done once in your
// frame loop instead of a busy wait.
while(pollResult.state==XR_FUTURE_STATE_PENDING_EXT) {
  CHK_XR(xrPollFutureEXT(instance, &pollInfo, &pollResult));
}

XrSpatialAnchorsQueryCompletionML completion {
    .type = XR_TYPE_SPATIAL_ANCHORS_QUERY_COMPLETION_ML,
};
CHK_XR(xrQuerySpatialAnchorsCompleteML(storage, future, &completion));
CHK_XR(completion.futureResult);

std::vector<XrUuidEXT> uuids(completion.uuidCountOutput);
completion.uuidCapacityInput = static_cast<uint32_t>(uuids.size());
completion.uuids = uuids.data();
```

```
CHK_XR(xrQuerySpatialAnchorsCompleteML(storage, future, &completion));

// completion.uuid will now contain the UUID of the corresponding spatial anchors.

CHK_XR(xrDestroySpatialAnchorsStorageML(storage));
```

12.182.9. New Object Types

- XrSpatialAnchorsStorageML

12.182.10. New Commands

- xrCreateSpatialAnchorsStorageML
- xrDeleteSpatialAnchorsAsyncML
- xrDeleteSpatialAnchorsCompleteML
- xrDestroySpatialAnchorsStorageML
- xrPublishSpatialAnchorsAsyncML
- xrPublishSpatialAnchorsCompleteML
- xrQuerySpatialAnchorsAsyncML
- xrQuerySpatialAnchorsCompleteML
- xrUpdateSpatialAnchorsExpirationAsyncML
- xrUpdateSpatialAnchorsExpirationCompleteML

12.182.11. New Structures

- XrSpatialAnchorCompletionResultML
- XrSpatialAnchorsCreateInfoFromUuidsML
- XrSpatialAnchorsCreateStorageInfoML
- XrSpatialAnchorsDeleteCompletionML
- XrSpatialAnchorsDeleteInfoML

12.183.1. Overview

This extension provides control over the system notifications. This extension allows system notifications that might obscure the field of view to be disabled.

Note that even when all system notifications have been suppressed, developers **can** still intercept certain events that allow them to properly react to the underlying reason of system notifications.

Permissions

Android applications **must** have the com.magicleap.permission.SYSTEM_NOTIFICATION permission listed in their manifest to use this extension. (protection level: normal)

12.183.2. Suppressing All System Notifications

Applications **can** suppress system notifications from being shown while the application has focus by calling xrSetSystemNotificationsML with the properly filled XrSystemNotificationsSetInfoML structure.

The xrSetSystemNotificationsML function is defined as:

```
// Provided by XR_ML_system_notifications
XrResult xrSetSystemNotificationsML(
    XrInstance                                  instance,
    const XrSystemNotificationsSetInfoML*       info);
```

Parameter Descriptions

- `instance` is XrInstance.
- `info` is a pointer to an XrSystemNotificationsSetInfoML structure.

This API will work only on certain SKUs. When called on an incompatible SKU the `XR_ERROR_SYSTEM_NOTIFICATION_INCOMPATIBLE_SKU_ML` error **must** be returned.

If the com.magicleap.permission.SYSTEM_NOTIFICATION permission is not granted, the runtime **must** return `XR_ERROR_SYSTEM_NOTIFICATION_PERMISSION_DENIED_ML`.

Valid Usage (Implicit)

- The `XR_ML_system_notifications` extension **must** be enabled prior to calling xrSetSystemNotificationsML
- `instance` **must** be a valid XrInstance handle
- `info` **must** be a pointer to a valid XrSystemNotificationsSetInfoML structure

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SYSTEM_NOTIFICATION_INCOMPATIBLE_SKU_ML
- XR_ERROR_SYSTEM_NOTIFICATION_PERMISSION_DENIED_ML
- XR_ERROR_VALIDATION_FAILURE

The XrSystemNotificationsSetInfoML structure is defined as:

```
// Provided by XR_ML_system_notifications
typedef struct XrSystemNotificationsSetInfoML {
    XrStructureType    type;
    const void*        next;
    XrBool32           suppressNotifications;
} XrSystemNotificationsSetInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- suppressNotifications is a boolean flag for suppressing all system notifications.

Valid Usage (Implicit)

- The XR_ML_system_notifications extension **must** be enabled prior to using XrSystemNotificationsSetInfoML
- type **must** be XR_TYPE_SYSTEM_NOTIFICATIONS_SET_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.183.3. New Commands

- xrSetSystemNotificationsML

12.183.4. New Structures

- XrSystemNotificationsSetInfoML

12.183.5. New Enum Constants

- `XR_ML_SYSTEM_NOTIFICATIONS_EXTENSION_NAME`
- `XR_ML_system_notifications_SPEC_VERSION`
- Extending XrResult:
  - `XR_ERROR_SYSTEM_NOTIFICATION_INCOMPATIBLE_SKU_ML`
  - `XR_ERROR_SYSTEM_NOTIFICATION_PERMISSION_DENIED_ML`
- Extending XrStructureType:
  - `XR_TYPE_SYSTEM_NOTIFICATIONS_SET_INFO_ML`

12.184.1. Overview

This extension **can** be used to determine how well the device is calibrated for the current user of the device. The extension provides two events for this purpose:

1. Headset Fit: Provides the quality of the fit of the headset on the user.
2. Eye Calibration: Provides the quality of the user's eye calibration.

12.184.2. Enabling user calibration events

User calibration events are requested by calling xrEnableUserCalibrationEventsML. When this function is called, each of the user calibration events **must** be posted to the event queue once, regardless of whether there were any changes to the event data. This allows the application to synchronize with the current state.

The xrEnableUserCalibrationEventsML function is defined as:

```
// Provided by XR_ML_user_calibration
XrResult xrEnableUserCalibrationEventsML(
    XrInstance                                  instance,
    const XrUserCalibrationEnableEventsInfoML*  enableInfo);
```

Parameter Descriptions

- `instance` is a handle to an XrInstance previously created with xrCreateInstance.
- `enableInfo` is the XrUserCalibrationEnableEventsInfoML that enables or disables user calibration events.

Valid Usage (Implicit)

- The `XR_ML_user_calibration` extension **must** be enabled prior to calling xrEnableUserCalibrationEventsML
- `instance` **must** be a valid XrInstance handle
- `enableInfo` **must** be a pointer to a valid XrUserCalibrationEnableEventsInfoML structure

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_VALIDATION_FAILURE`

The XrUserCalibrationEnableEventsInfoML structure is defined as:

```
// Provided by XR_ML_user_calibration
typedef struct XrUserCalibrationEnableEventsInfoML {
    XrStructureType    type;
    const void*        next;
    XrBool32           enabled;
} XrUserCalibrationEnableEventsInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `enabled` is the flag to enable/disable user calibration events.

Valid Usage (Implicit)

- The XR_ML_user_calibration extension **must** be enabled prior to using XrUserCalibrationEnableEventsInfoML
- type **must** be XR_TYPE_USER_CALIBRATION_ENABLE_EVENTS_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.184.3. Headset Fit Events

Receiving an XrEventDataHeadsetFitChangedML event from xrPollEvent notifies the application of headset fit changes. To enable these events call xrEnableUserCalibrationEventsML and set XrUserCalibrationEnableEventsInfoML::enabled to true. Headset fit is evaluated continuously and the runtime **must** post events anytime it detects a change in the headset fit state.

The XrEventDataHeadsetFitChangedML structure is defined as:

```
// Provided by XR_ML_user_calibration
typedef struct XrEventDataHeadsetFitChangedML {
    XrStructureType         type;
    const void*             next;
    XrHeadsetFitStatusML    status;
    XrTime                  time;
} XrEventDataHeadsetFitChangedML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- status is the XrHeadsetFitStatusML headset fit status.
- time is the XrTime at which the status was captured.

Valid Usage (Implicit)

- The XR_ML_user_calibration extension **must** be enabled prior to using XrEventDataHeadsetFitChangedML
- type **must** be XR_TYPE_EVENT_DATA_HEADSET_FIT_CHANGED_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

```
// Provided by XR_ML_user_calibration
typedef enum XrHeadsetFitStatusML {
    XR_HEADSET_FIT_STATUS_UNKNOWN_ML = 0,
    XR_HEADSET_FIT_STATUS_NOT_WORN_ML = 1,
    XR_HEADSET_FIT_STATUS_GOOD_FIT_ML = 2,
    XR_HEADSET_FIT_STATUS_BAD_FIT_ML = 3,
    XR_HEADSET_FIT_STATUS_MAX_ENUM_ML = 0x7FFFFFFF
} XrHeadsetFitStatusML;
```

Enum	Description
XR_HEADSET_FIT_STATUS_UNKNOWN_ML	Headset fit status not available for unknown reason.
XR_HEADSET_FIT_STATUS_NOT_WORN_ML	Headset not worn.
XR_HEADSET_FIT_STATUS_GOOD_FIT_ML	Good fit.
XR_HEADSET_FIT_STATUS_BAD_FIT_ML	Bad fit.

12.184.4. Eye Calibration Events

Receiving an XrEventDataEyeCalibrationChangedML event from xrPollEvent notifies the application of eye calibration changes. To enable these events call xrEnableUserCalibrationEventsML and set XrUserCalibrationEnableEventsInfoML::enabled to true. Runtime **must** post events anytime it detects a change in the eye calibration. The user needs to calibrate the eyes using the system app provided for this. There is no support for in-app eye calibration in this extension.

The XrEventDataEyeCalibrationChangedML structure is defined as:

```
// Provided by XR_ML_user_calibration
typedef struct XrEventDataEyeCalibrationChangedML {
    XrStructureType             type;
    const void*                 next;
    XrEyeCalibrationStatusML    status;
} XrEventDataEyeCalibrationChangedML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- status is the XrEyeCalibrationStatusML eye calibration status.

Valid Usage (Implicit)

- The XR_ML_user_calibration extension **must** be enabled prior to using XrEventDataEyeCalibrationChangedML
- type **must** be XR_TYPE_EVENT_DATA_EYE_CALIBRATION_CHANGED_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

```
// Provided by XR_ML_user_calibration
typedef enum XrEyeCalibrationStatusML {
    XR_EYE_CALIBRATION_STATUS_UNKNOWN_ML = 0,
    XR_EYE_CALIBRATION_STATUS_NONE_ML = 1,
    XR_EYE_CALIBRATION_STATUS_COARSE_ML = 2,
    XR_EYE_CALIBRATION_STATUS_FINE_ML = 3,
    XR_EYE_CALIBRATION_STATUS_MAX_ENUM_ML = 0x7FFFFFFF
} XrEyeCalibrationStatusML;
```

Enum	Description
XR_EYE_CALIBRATION_STATUS_UNKNOWN_ML	Eye calibration status not available for unknown reason.
XR_EYE_CALIBRATION_STATUS_NONE_ML	User has not performed the eye calibration step. Use system provided app to perform eye calibration.
XR_EYE_CALIBRATION_STATUS_COARSE_ML	Eye calibration is of lower accuracy.
XR_EYE_CALIBRATION_STATUS_FINE_ML	Eye calibration is of higher accuracy.

12.184.5. New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_EVENT_DATA_HEADSET_FIT_CHANGED_ML
- XR_TYPE_EVENT_DATA_EYE_CALIBRATION_CHANGED_ML
- XR_TYPE_USER_CALIBRATION_ENABLE_EVENTS_INFO_ML

12.185.1. Overview

There is a desire for runtimes to be able to inform applications of changes in clipping planes during the lifetime of an XrInstance.

12.185.2. Background

The XrViewConfigurationDepthRangeEXT structure is used to inform applications of the clipping plane values. However, since this information is obtained via xrEnumerateViewConfigurations its contents **must** not change.

12.185.3. Behavior change

When this extension is enabled, the runtime **may** change the contents of XrViewConfigurationDepthRangeEXT during the lifetime of an XrInstance.

Applications **should** track changes in the clipping plane values as provided by the runtime every frame.

Be aware that unlike most OpenXR extensions, enabling this extension is all that is required for runtime behavior to change, which **may** have impacts on modular applications, including applications built on engines.

12.185.4. New Enum Constants

- `XR_ML_VIEW_CONFIGURATION_DEPTH_RANGE_CHANGE_EXTENSION_NAME`
- `XR_ML_view_configuration_depth_range_change_SPEC_VERSION`

12.186.1. Overview

This extension provides the functionality to detect the world mesh.

12.186.2. Creating a world mesh detector

The XrWorldMeshDetectorML handle is defined as:

```
// Provided by XR_ML_world_mesh_detection
XR_DEFINE_HANDLE(XrWorldMeshDetectorML)
```

XrWorldMeshDetectorML is created by xrCreateWorldMeshDetectorML.

The xrCreateWorldMeshDetectorML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrCreateWorldMeshDetectorML(
    XrSession                                   session,
    const XrWorldMeshDetectorCreateInfoML*      createInfo,
    XrWorldMeshDetectorML*                      detector);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `createInfo` is a pointer to an XrWorldMeshDetectorCreateInfoML structure.
- `detector` is a pointer to XrWorldMeshDetectorML, returned by the runtime.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrCreateWorldMeshDetectorML
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrWorldMeshDetectorCreateInfoML structure
- `detector` **must** be a pointer to an XrWorldMeshDetectorML handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE
- XR_ERROR_WORLD_MESH_DETECTOR_PERMISSION_DENIED_ML

Permissions

Android applications **must** have the com.magicleap.permission.SPATIAL_MAPPING permission listed in their manifest to use this extension. (protection level: dangerous)

The XrWorldMeshDetectorCreateInfoML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshDetectorCreateInfoML {
    XrStructureType    type;
    const void*        next;
} XrWorldMeshDetectorCreateInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshDetectorCreateInfoML
- type **must** be XR_TYPE_WORLD_MESH_DETECTOR_CREATE_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

12.186.3. Destroying a world mesh detector

The xrDestroyWorldMeshDetectorML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrDestroyWorldMeshDetectorML(
    XrWorldMeshDetectorML                       detector);
```

Parameter Descriptions

- detector is the XrWorldMeshDetectorML to destroy.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to calling xrDestroyWorldMeshDetectorML
- detector **must** be a valid XrWorldMeshDetectorML handle

Thread Safety

- Access to detector, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

12.186.4. Detecting the World Mesh

Detecting the world mesh is done by blocks. Instead of returning the whole world mesh as one entity, this system returns the world mesh in chunks called blocks. To retrieve the currently detected chunks use xrRequestWorldMeshStateAsyncML.

The xrRequestWorldMeshStateAsyncML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrRequestWorldMeshStateAsyncML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshStateRequestInfoML*        stateRequest,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- detector is the XrWorldMeshDetectorML to use.
- stateRequest is the XrWorldMeshStateRequestInfoML request information.
- future is a pointer to a runtime created XrFutureEXT.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to calling xrRequestWorldMeshStateAsyncML
- detector **must** be a valid XrWorldMeshDetectorML handle
- stateRequest **must** be a pointer to a valid XrWorldMeshStateRequestInfoML structure
- future **must** be a pointer to an XrFutureEXT value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE
- XR_ERROR_WORLD_MESH_DETECTOR_SPACE_NOT_LOCATABLE_ML

The XrWorldMeshStateRequestInfoML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshStateRequestInfoML {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
    XrPosef            boundingBoxCenter;
    XrExtent3DfEXT     boundingBoxExtents;
} XrWorldMeshStateRequestInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `baseSpace` is the base space used by the bounding box.
- `time` is the time at which the bounding box location is resolved.
- `boundingBoxCenter` the XrPosef of the bounding box center.
- `boundingBoxExtents` the XrExtent3DfEXT of the bounding box. These extents indicate the full size of the box, so an XrExtent3DfEXT of 1.0,1.0,1.0 has a volume of 1 cubic meter and the box's center is at `boundingBoxCenter`.

Each mesh block **may** have a 'skirt' if `XR_WORLD_MESH_DETECTOR_REMOVE_MESH_SKIRT_BIT_ML` was not specified during the creation of the XrWorldMeshDetectorML. A skirt provides some overlap between adjacent mesh blocks. While a skirt improves coverage between blocks, it does not create a watertight mesh.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshStateRequestInfoML
- `type` **must** be `XR_TYPE_WORLD_MESH_STATE_REQUEST_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

```
// Provided by XR_ML_world_mesh_detection
typedef XrFlags64 XrWorldMeshDetectorFlagsML;
```

```
// Provided by XR_ML_world_mesh_detection
// Flag bits for XrWorldMeshDetectorFlagsML
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_POINT_CLOUD_BIT_ML =
0x00000001;
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_COMPUTE_NORMALS_BIT_ML =
0x00000002;
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_COMPUTE_CONFIDENCE_BIT_ML
= 0x00000004;
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_PLANARIZE_BIT_ML =
0x00000008;
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_REMOVE_MESH_SKIRT_BIT_ML =
0x00000010;
static const XrWorldMeshDetectorFlagsML XR_WORLD_MESH_DETECTOR_INDEX_ORDER_CW_BIT_ML =
0x00000020;
```

Flag Descriptions

- XR_WORLD_MESH_DETECTOR_POINT_CLOUD_BIT_ML — If set, will return a point cloud instead of a triangle mesh.
- XR_WORLD_MESH_DETECTOR_COMPUTE_NORMALS_BIT_ML — If set, the system will compute the normals for the triangle vertices.
- XR_WORLD_MESH_DETECTOR_COMPUTE_CONFIDENCE_BIT_ML — If set, the system will compute the confidence values.
- XR_WORLD_MESH_DETECTOR_PLANARIZE_BIT_ML — If set, the system will planarize the returned mesh (planar regions will be smoothed out).
- XR_WORLD_MESH_DETECTOR_REMOVE_MESH_SKIRT_BIT_ML — If set, the mesh skirt (overlapping area between two mesh blocks) will be removed.
- XR_WORLD_MESH_DETECTOR_INDEX_ORDER_CW_BIT_ML — If set, winding order of indices will be be changed from counter clockwise to clockwise.

xrRequestWorldMeshStateAsyncML is an asynchronous function and xrRequestWorldMeshStateCompleteML retrieves the data once the future is ready.

The xrRequestWorldMeshStateCompleteML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrRequestWorldMeshStateCompleteML(
    XrWorldMeshDetectorML                       detector,
    XrFutureEXT                                 future,
    XrWorldMeshStateRequestCompletionML*        completion);
```

Parameter Descriptions

- `detector` is the XrWorldMeshDetectorML to use.
- `future` is a the `XrFutureEXT` to complete.
- `completion` is a pointer to the XrWorldMeshStateRequestCompletionML structure.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrRequestWorldMeshStateCompleteML
- `detector` **must** be a valid XrWorldMeshDetectorML handle
- `completion` **must** be a pointer to an XrWorldMeshStateRequestCompletionML structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_FUTURE_INVALID_EXT`
- `XR_ERROR_FUTURE_PENDING_EXT`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

The XrWorldMeshStateRequestCompletionML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshStateRequestCompletionML {
    XrStructureType             type;
    void*                       next;
    XrResult                    futureResult;
    XrTime                      timestamp;
    uint32_t                    meshBlockStateCapacityInput;
    uint32_t                    meshBlockStateCountOutput;
    XrWorldMeshBlockStateML*    meshBlockStates;
} XrWorldMeshStateRequestCompletionML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `futureResult` is the XrResult of the asynchronous operation.
- `timestamp` is the `XrTime` of the request.
- `meshBlockStateCapacityInput` is the capacity of the `meshBlockStates` array, or 0 to indicate a request to retrieve the required capacity.
- `meshBlockStateCountOutput` is filled in by the runtime with the count of mesh states written or the required capacity in the case that `meshBlockStateCapacityInput` is insufficient.
- `meshBlockStates` is a pointer to an array of XrWorldMeshBlockStateML.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_WORLD_MESH_DETECTOR_SPACE_NOT_LOCATABLE_ML`

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshStateRequestCompletionML
- `type` **must** be `XR_TYPE_WORLD_MESH_STATE_REQUEST_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `futureResult` **must** be a valid XrResult value
- If `meshBlockStateCapacityInput` is not `0`, `meshBlockStates` **must** be a pointer to an array of `meshBlockStateCapacityInput` XrWorldMeshBlockStateML structures

The XrWorldMeshBlockStateML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBlockStateML {
    XrStructureType             type;
    void*                       next;
    XrUuidEXT                   uuid;
    XrPosef                     meshBoundingBoxCenter;
    XrExtent3DfEXT              meshBoundingBoxExtents;
    XrTime                      lastUpdateTime;
    XrWorldMeshBlockStatusML    status;
} XrWorldMeshBlockStateML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuid` is the XrUuidEXT of the mesh block.
- `meshBoundingBoxCenter` the XrPosef of the mesh's bounding box center.
- `meshBoundingBoxExtents` the XrExtent3DfEXT of the mesh's bounding box.
- `lastUpdateTime` is the `XrTime` at which this mesh was last updated.
- `status` is an XrWorldMeshBlockStatusML indicating the status of the mesh block.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshBlockStateML
- `type` **must** be `XR_TYPE_WORLD_MESH_BLOCK_STATE_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `status` **must** be a valid XrWorldMeshBlockStatusML value

```
// Provided by XR_ML_world_mesh_detection
typedef enum XrWorldMeshBlockStatusML {
    XR_WORLD_MESH_BLOCK_STATUS_NEW_ML = 0,
    XR_WORLD_MESH_BLOCK_STATUS_UPDATED_ML = 1,
    XR_WORLD_MESH_BLOCK_STATUS_DELETED_ML = 2,
    XR_WORLD_MESH_BLOCK_STATUS_UNCHANGED_ML = 3,
    XR_WORLD_MESH_BLOCK_STATUS_MAX_ENUM_ML = 0x7FFFFFFF
} XrWorldMeshBlockStatusML;
```

Enum	Description
`XR_WORLD_MESH_BLOCK_STATUS_NEW_ML`	The mesh block has been created.
`XR_WORLD_MESH_BLOCK_STATUS_UPDATED_ML`	The mesh block has been updated.
`XR_WORLD_MESH_BLOCK_STATUS_DELETED_ML`	The mesh block has been deleted.
`XR_WORLD_MESH_BLOCK_STATUS_UNCHANGED_ML`	The mesh block is unchanged.

12.186.5. Allocate Mesh Block Memory

The next step is to retrieve the actual vertex data. This operation will require a buffer to be available

for the duration of the asynchronous operation and for as long as the application needs access to XrWorldMeshRequestCompletionML.

This buffer must be allocated by the application, the system provides recommended buffer size using the xrGetWorldMeshBufferRecommendSizeML function.

The xrGetWorldMeshBufferRecommendSizeML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrGetWorldMeshBufferRecommendSizeML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshBufferRecommendedSizeInfoML* sizeInfo,
    XrWorldMeshBufferSizeML*                    size);
```

Parameter Descriptions

- `detector` is the XrWorldMeshDetectorML to use.
- `sizeInfo` is a pointer to an XrWorldMeshBufferRecommendedSizeInfoML structure.
- `size` is the XrWorldMeshBufferSizeML, this will be filled by the runtime with the size to allocate for the xrRequestWorldMeshAsyncML function. `size` **must** be larger than 0.

Errata: This function is called `xrGetWorldMeshBufferRecommendSizeML` rather than the expected `xrGetWorldMeshBufferRecommendedSizeML`.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrGetWorldMeshBufferRecommendSizeML
- `detector` **must** be a valid XrWorldMeshDetectorML handle
- `sizeInfo` **must** be a pointer to a valid XrWorldMeshBufferRecommendedSizeInfoML structure
- `size` **must** be a pointer to an XrWorldMeshBufferSizeML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrWorldMeshBufferRecommendedSizeInfoML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBufferRecommendedSizeInfoML {
    XrStructureType    type;
    const void*        next;
    uint32_t           maxBlockCount;
} XrWorldMeshBufferRecommendedSizeInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- maxBlockCount is a uint32_t of the maximum number of blocks in the request.

The value for maxBlockCount **should** be populated XrWorldMeshStateRequestCompletionML ::meshBlockStateCountOutput. As long as the maxBlockCount is equal or larger to this XrWorldMeshStateRequestCompletionML::meshBlockStateCountOutput, a memory block **may** be reused for new requests.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshBufferRecommendedSizeInfoML
- type **must** be XR_TYPE_WORLD_MESH_BUFFER_RECOMMENDED_SIZE_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrWorldMeshBufferSizeML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBufferSizeML {
    XrStructureType    type;
    void*              next;
    uint32_t           size;
} XrWorldMeshBufferSizeML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- size is a uint32_t indicating the number of bytes recommended.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshBufferSizeML
- type **must** be XR_TYPE_WORLD_MESH_BUFFER_SIZE_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain

Some runtimes have optimized memory available that avoids memory copies and provides the fastest way to get the vertex data. Applications **should** use the xrAllocateWorldMeshBufferML function to reserve memory for the vertex data. The application however **may** choose to allocate its own memory using alternative methods.

The xrAllocateWorldMeshBufferML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrAllocateWorldMeshBufferML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshBufferSizeML*              size,
    XrWorldMeshBufferML*                        buffer);
```

Parameter Descriptions

- `detector` is the XrWorldMeshDetectorML to use.
- `size` is the XrWorldMeshBufferSizeML request information previously retrieved via xrGetWorldMeshBufferRecommendSizeML.
- `buffer` is a pointer to an XrWorldMeshBufferML that will be filled by the runtime with a pointer to a memory block and size of the buffer.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrAllocateWorldMeshBufferML
- `detector` **must** be a valid XrWorldMeshDetectorML handle
- `size` **must** be a pointer to a valid XrWorldMeshBufferSizeML structure
- `buffer` **must** be a pointer to an XrWorldMeshBufferML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrWorldMeshBufferML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBufferML {
    XrStructureType    type;
    void*              next;
    uint32_t           bufferSize;
    void*              buffer;
} XrWorldMeshBufferML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- bufferSize is a uint32_t indicating the size of the buffer in bytes.
- buffer is a void memory block. This memory **may** be allocated using xrAllocateWorldMeshBufferML or otherwise.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshBufferML
- type **must** be XR_TYPE_WORLD_MESH_BUFFER_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- buffer **must** be a pointer to an array of bufferSize bytes
- The bufferSize parameter **must** be greater than 0

Memory blocks allocated with xrAllocateWorldMeshBufferML **must** be freed using xrFreeWorldMeshBufferML.

The xrFreeWorldMeshBufferML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrFreeWorldMeshBufferML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshBufferML*                  buffer);
```

Parameter Descriptions

- detector is the XrWorldMeshDetectorML to use.
- buffer is a pointer to XrWorldMeshBufferML to be freed.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to calling xrFreeWorldMeshBufferML
- detector **must** be a valid XrWorldMeshDetectorML handle
- buffer **must** be a pointer to a valid XrWorldMeshBufferML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.186.6. Start Mesh Data Query

Once a buffer has been allocated the mesh data retrieval **may** be started using xrRequestWorldMeshAsyncML.

The xrRequestWorldMeshAsyncML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrRequestWorldMeshAsyncML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshGetInfoML*                 getInfo,
    XrWorldMeshBufferML*                        buffer,
    XrFutureEXT*                                future);
```

Parameter Descriptions

- detector is the XrWorldMeshDetectorML to use.
- getInfo is a pointer to an XrWorldMeshGetInfoML structure.
- buffer is a pointer to an XrWorldMeshBufferML to be used. This buffer **must** be kept available for the duration of the request and for however long the application needs access to the vertex buffer.
- future is a pointer to an XrFutureEXT to be filled by the runtime.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrRequestWorldMeshAsyncML
- `detector` **must** be a valid XrWorldMeshDetectorML handle
- `getInfo` **must** be a pointer to a valid XrWorldMeshGetInfoML structure
- `buffer` **must** be a pointer to an XrWorldMeshBufferML structure
- `future` **must** be a pointer to an `XrFutureEXT` value

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrWorldMeshGetInfoML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshGetInfoML {
    XrStructureType               type;
    const void*                   next;
    XrWorldMeshDetectorFlagsML    flags;
    float                         fillHoleLength;
    float                         disconnectedComponentArea;
    uint32_t                      blockCount;
    XrWorldMeshBlockRequestML*    blocks;
} XrWorldMeshGetInfoML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `flags` are the detector flags defined by XrWorldMeshDetectorFlagBitsML.
- `fillHoleLength` Any hole which has perimeter (in meters) less than `fillHoleLength` will be filled. The maximum hole perimeter is limited to 5 meters, the runtime **must** clamp the value between 0 and 5 meters. Also the maximum area of the hole **should** not exceed 0.5 square meters. If the hole overlaps with neighboring mesh block(s), it will not be filled in.
- `disconnectedComponentArea` Any component that is disconnected from the main mesh which has an area (in square meters) less than `disconnectedComponentArea` will be removed. The maximum area is limited to 2 square meters, and the area needs to exist fully within a mesh block boundary without skirt. The runtime **must** clamp this value between 0 and 2 square meters.
- `blockCount` is a `uint32_t` indicating the number of elements in the `blocks` array.
- `blocks` is an array of XrWorldMeshBlockRequestML.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshGetInfoML
- `type` **must** be `XR_TYPE_WORLD_MESH_GET_INFO_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `flags` **must** be `0` or a valid combination of XrWorldMeshDetectorFlagBitsML values
- `blocks` **must** be a pointer to an array of `blockCount` XrWorldMeshBlockRequestML structures
- The `blockCount` parameter **must** be greater than `0`

The XrWorldMeshBlockRequestML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBlockRequestML {
    XrStructureType             type;
    void*                       next;
    XrUuidEXT                   uuid;
    XrWorldMeshDetectorLodML    lod;
} XrWorldMeshBlockRequestML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuid` is the XrUuidEXT of the mesh block to retrieve.
- `lod` is the XrWorldMeshDetectorLodML level of detail of the mesh to retrieve.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshBlockRequestML
- `type` **must** be `XR_TYPE_WORLD_MESH_BLOCK_REQUEST_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `lod` **must** be a valid XrWorldMeshDetectorLodML value

```
// Provided by XR_ML_world_mesh_detection
typedef enum XrWorldMeshDetectorLodML {
    XR_WORLD_MESH_DETECTOR_LOD_MINIMUM_ML = 0,
    XR_WORLD_MESH_DETECTOR_LOD_MEDIUM_ML = 1,
    XR_WORLD_MESH_DETECTOR_LOD_MAXIMUM_ML = 2,
    XR_WORLD_MESH_DETECTOR_LOD_MAX_ENUM_ML = 0x7FFFFFFF
} XrWorldMeshDetectorLodML;
```

Enum	Description
`XR_WORLD_MESH_DETECTOR_LOD_MINIMUM_ML`	Minimum Level of Detail (LOD) for the mesh.
`XR_WORLD_MESH_DETECTOR_LOD_MEDIUM_ML`	Medium Level of Detail (LOD) for the mesh.
`XR_WORLD_MESH_DETECTOR_LOD_MAXIMUM_ML`	Maximum Level of Detail (LOD) for the mesh.

12.186.7. Complete Mesh Data Query

To complete the previously started mesh data query xrRequestWorldMeshCompleteML is used.

The xrRequestWorldMeshCompleteML function is defined as:

```
// Provided by XR_ML_world_mesh_detection
XrResult xrRequestWorldMeshCompleteML(
    XrWorldMeshDetectorML                       detector,
    const XrWorldMeshRequestCompletionInfoML*   completionInfo,
    XrFutureEXT                                 future,
    XrWorldMeshRequestCompletionML*             completion);
```

Parameter Descriptions

- `detector` is the XrWorldMeshDetectorML to use.
- `future` is an `XrFutureEXT` to complete.
- `completionInfo` is a pointer to XrWorldMeshRequestCompletionInfoML.
- `completion` is a pointer to XrWorldMeshRequestCompletionML containing the completion result.

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to calling xrRequestWorldMeshCompleteML
- `detector` **must** be a valid XrWorldMeshDetectorML handle
- `completionInfo` **must** be a pointer to a valid XrWorldMeshRequestCompletionInfoML structure
- `completion` **must** be a pointer to an XrWorldMeshRequestCompletionML structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_FUTURE_INVALID_EXT
- XR_ERROR_FUTURE_PENDING_EXT
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE
- XR_ERROR_WORLD_MESH_DETECTOR_SPACE_NOT_LOCATABLE_ML

The XrWorldMeshRequestCompletionInfoML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshRequestCompletionInfoML {
    XrStructureType    type;
    const void*        next;
    XrSpace            meshSpace;
    XrTime             meshSpaceLocateTime;
} XrWorldMeshRequestCompletionInfoML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- meshSpace the space used to express the vertex data in.
- meshSpaceLocateTime the time used to locate the meshSpace.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshRequestCompletionInfoML
- type **must** be XR_TYPE_WORLD_MESH_REQUEST_COMPLETION_INFO_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- meshSpace **must** be a valid XrSpace handle

The XrWorldMeshRequestCompletionML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshRequestCompletionML {
    XrStructureType        type;
    void*                  next;
    XrResult               futureResult;
    uint32_t               blockCount;
    XrWorldMeshBlockML*    blocks;
} XrWorldMeshRequestCompletionML;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- futureResult is the XrResult of the asynchronous operation.
- blockCount is a uint32_t that **must** match XrWorldMeshGetInfoML::blockCount parameter.
- blocks is an array of XrWorldMeshBlockML structures containing the vertex data pointers.

Future Return Codes

`futureResult` values:

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_LIMIT_REACHED`

Valid Usage (Implicit)

- The `XR_ML_world_mesh_detection` extension **must** be enabled prior to using XrWorldMeshRequestCompletionML
- `type` **must** be `XR_TYPE_WORLD_MESH_REQUEST_COMPLETION_ML`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `futureResult` **must** be a valid XrResult value
- `blocks` **must** be a pointer to an array of `blockCount` XrWorldMeshBlockML structures
- The `blockCount` parameter **must** be greater than `0`

The XrWorldMeshBlockML structure is defined as:

```
// Provided by XR_ML_world_mesh_detection
typedef struct XrWorldMeshBlockML {
    XrStructureType               type;
    void*                         next;
    XrUuidEXT                     uuid;
    XrWorldMeshBlockResultML      blockResult;
    XrWorldMeshDetectorLodML      lod;
    XrWorldMeshDetectorFlagsML    flags;
    uint32_t                      indexCount;
    uint16_t*                     indexBuffer;
    uint32_t                      vertexCount;
    XrVector3f*                   vertexBuffer;
    uint32_t                      normalCount;
    XrVector3f*                   normalBuffer;
    uint32_t                      confidenceCount;
    float*                        confidenceBuffer;
} XrWorldMeshBlockML;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `uuid` is the XrUuidEXT of the mesh block
- `blockResult` is the XrWorldMeshBlockResultML of the mesh block.
- `lod` is the XrWorldMeshDetectorLodML used to generated this mesh block.
- `flags` are the detector flags defined by XrWorldMeshDetectorFlagBitsML.
- `indexCount` is the number of indices in the `indexBuffer`.
- `indexBuffer` is the index buffer of type `uint16_t`. In the indexBuffer each value is the index of a vertex in the vertexBuffer. Three indices define one triangle. For example, the first triangle will have the vertices: `vertexBuffer[index[0]]`, `vertexBuffer[index[1]]`, `vertexBuffer[index[2]]`. Index order is defined by the `XR_WORLD_MESH_DETECTOR_INDEX_ORDER_CW_BIT_ML` flag.
- `vertexCount` is the number of vertices in the `vertexBuffer`.
- `vertexBuffer` is the vertex buffer of type XrVector3f. Vertex data will be provided in the XrWorldMeshStateRequestInfoML::`baseSpace` at time XrWorldMeshBlockStateML ::`lastUpdateTime`.
- `normalCount` is the number of normals in the `normalBuffer`.
- `normalBuffer` is the normal buffer of type XrVector3f.
- `confidenceCount` is the number of confidence values in the `confidenceBuffer`.
- `confidenceBuffer` is the confidence buffer of type `float` with range 0.0 - 1.0.

`normalCount` **must** be equal to `vertexCount` if `XR_WORLD_MESH_DETECTOR_COMPUTE_NORMALS_BIT_ML` was specified during XrWorldMeshDetectorML creation, otherwise 0.

`confidenceCount` **must** be equal to `vertexCount` if `XR_WORLD_MESH_DETECTOR_COMPUTE_CONFIDENCE_BIT_ML` was specified during XrWorldMeshDetectorML creation, otherwise 0.

Valid Usage (Implicit)

- The XR_ML_world_mesh_detection extension **must** be enabled prior to using XrWorldMeshBlockML
- type **must** be XR_TYPE_WORLD_MESH_BLOCK_ML
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- blockResult **must** be a valid XrWorldMeshBlockResultML value
- lod **must** be a valid XrWorldMeshDetectorLodML value
- flags **must** be a valid combination of XrWorldMeshDetectorFlagBitsML values
- flags **must** not be 0
- indexBuffer **must** be a pointer to an array of indexCount uint16_t values
- vertexBuffer **must** be a pointer to an array of vertexCount XrVector3f structures
- normalBuffer **must** be a pointer to an array of normalCount XrVector3f structures
- confidenceBuffer **must** be a pointer to an array of confidenceCount float values
- The indexCount parameter **must** be greater than 0
- The vertexCount parameter **must** be greater than 0
- The normalCount parameter **must** be greater than 0
- The confidenceCount parameter **must** be greater than 0

```
// Provided by XR_ML_world_mesh_detection
typedef enum XrWorldMeshBlockResultML {
    XR_WORLD_MESH_BLOCK_RESULT_SUCCESS_ML = 0,
    XR_WORLD_MESH_BLOCK_RESULT_FAILED_ML = 1,
    XR_WORLD_MESH_BLOCK_RESULT_PENDING_ML = 2,
    XR_WORLD_MESH_BLOCK_RESULT_PARTIAL_UPDATE_ML = 3,
    XR_WORLD_MESH_BLOCK_RESULT_MAX_ENUM_ML = 0x7FFFFFFF
} XrWorldMeshBlockResultML;
```

Enum	Description
XR_WORLD_MESH_BLOCK_RESULT_SUCCESS_ML	Mesh request has succeeded.
XR_WORLD_MESH_BLOCK_RESULT_FAILED_ML	Mesh request has failed.
XR_WORLD_MESH_BLOCK_RESULT_PENDING_ML	Mesh request is pending.
XR_WORLD_MESH_BLOCK_RESULT_PARTIAL_UPDATE_ML	There are partial updates on the mesh request.

12.186.8. Sample code

Overview

Some applications may wish to access XR interaction devices without presenting any image content on the display(s). This extension provides a mechanism for writing such an application using the OpenXR API. It modifies the specification in the following ways, without adding any new named entities.

- When this extension is enabled, an application **may** call xrCreateSession without having made a

call to xrGet*GraphicsRequirements, and without an XrGraphicsBinding* structure in the next chain of XrSessionCreateInfo.

- If an application does not include an XrGraphicsBinding* structure in the next chain of XrSessionCreateInfo, the runtime **must** create a "headless" session that does not interact with the display.
- In a headless session, the session state **should** proceed to XR_SESSION_STATE_READY directly from XR_SESSION_STATE_IDLE.
- In a headless session, the XrSessionBeginInfo::primaryViewConfigurationType **must** be ignored and **may** be 0.
- In a headless session, the session state proceeds to XR_SESSION_STATE_SYNCHRONIZED, then XR_SESSION_STATE_VISIBLE and XR_SESSION_STATE_FOCUSED, after the call to xrBeginSession. The application does not need to call xrWaitFrame, xrBeginFrame, or xrEndFrame, unlike with non-headless sessions.
- In a headless session, xrEnumerateSwapchainFormats **must** return XR_SUCCESS but enumerate 0 formats.
- xrWaitFrame **must** set XrFrameState::shouldRender to XR_FALSE in a headless session. The VISIBLE and FOCUSED states are only used for their input-related semantics, not their rendering-related semantics, and these functions are permitted to allow minimal change between headless and non-headless code if desired.

Because xrWaitFrame is not required, an application using a headless session **should** sleep periodically to avoid consuming all available system resources in a busy-wait loop.

New Object Types

New Flag Types

New Enum Constants

New Enums

Extension and Version Dependencies

OpenXR 1.0

Overview

This extension enables the querying of audio device information associated with an OpenXR instance.

On Windows, there may be multiple audio devices available on the system. This extensions allows applications to query the runtime for the appropriate audio devices for the active HMD.

New Object Types

New Flag Types

New Enum Constants

- `XR_MAX_AUDIO_DEVICE_STR_SIZE_OCULUS`

New Enums

New Structures

New Functions

```
// Provided by XR_OCULUS_audio_device_guid
XrResult xrGetAudioOutputDeviceGuidOculus(
    XrInstance                                  instance,
    wchar_t                                     buffer
[XR_MAX_AUDIO_DEVICE_STR_SIZE_OCULUS]);
```

Parameter Descriptions

- `instance` is the XrInstance to query the audio device state in.
- `buffer` is a fixed size buffer which will contain the audio device GUID. The format of this data matches the IMMDevice::GetId API.

Valid Usage (Implicit)

- The `XR_OCULUS_audio_device_guid` extension **must** be enabled prior to calling xrGetAudioOutputDeviceGuidOculus
- `instance` **must** be a valid XrInstance handle
- `buffer` **must** be a wide character array of length `XR_MAX_AUDIO_DEVICE_STR_SIZE_OCULUS`

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_VALIDATION_FAILURE`

```
// Provided by XR_OCULUS_audio_device_guid
XrResult xrGetAudioInputDeviceGuidOculus(
    XrInstance                                  instance,
    wchar_t                                     buffer
[XR_MAX_AUDIO_DEVICE_STR_SIZE_OCULUS]);
```

Parameter Descriptions

- `instance` is the XrInstance to query the audio device state in.
- `buffer` is a fixed size buffer which will contain the audio device GUID. The format of this data matches the IMMDevice::GetId API.

Valid Usage (Implicit)

- The `XR_OCULUS_audio_device_guid` extension **must** be enabled prior to calling xrGetAudioInputDeviceGuidOculus
- `instance` **must** be a valid XrInstance handle
- `buffer` **must** be a wide character array of length `XR_MAX_AUDIO_DEVICE_STR_SIZE_OCULUS`

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_VALIDATION_FAILURE`

Issues

1. The intent of xrGetAudioInputDeviceGuidOculus and xrGetAudioOutputDeviceGuidOculus is to provide GUIDs associated with the active head mounted device. In OpenXR, a particular system is represented by an `XrSystemId`. If these commands were to be reimplemented, they should also pass

a `XrSystemId` parameter to allow the head mounted device system to be specified.

2. The names xrGetAudioInputDeviceGuidOculus and xrGetAudioOutputDeviceGuidOculus do not match the convention for OpenXR command names. If these commands were to be reimplemented, `Oculus` should be replaced by `OCULUS`.

Extension and Version Dependencies

OpenXR 1.0

Overview

This extension enables the querying of external camera information for a session. This extension is intended to enable mixed reality capture support for applications.

This extension does not provide a mechanism for supplying external camera information to the runtime. If external camera information is not supplied to the runtime before using this extension, no camera information will be returned.

This API supports returning camera intrinsics and extrinsics:

- Camera intrinsics are the attributes of the camera: resolution, field of view, etc.
- Camera extrinsics are everything external to the camera: relative pose, attached to, etc.
- We do not expect the camera intrinsics to change frequently. We expect the camera extrinsics to

change frequently.

New Object Types

New Flag Types

```
// Provided by XR_OCULUS_external_camera
typedef XrFlags64 XrExternalCameraStatusFlagsOCULUS;
```

```
// Provided by XR_OCULUS_external_camera
// Flag bits for XrExternalCameraStatusFlagsOCULUS
static const XrExternalCameraStatusFlagsOCULUS
XR_EXTERNAL_CAMERA_STATUS_CONNECTED_BIT_OCULUS = 0x00000001;
static const XrExternalCameraStatusFlagsOCULUS
XR_EXTERNAL_CAMERA_STATUS_CALIBRATING_BIT_OCULUS = 0x00000002;
static const XrExternalCameraStatusFlagsOCULUS
XR_EXTERNAL_CAMERA_STATUS_CALIBRATION_FAILED_BIT_OCULUS = 0x00000004;
static const XrExternalCameraStatusFlagsOCULUS
XR_EXTERNAL_CAMERA_STATUS_CALIBRATED_BIT_OCULUS = 0x00000008;
static const XrExternalCameraStatusFlagsOCULUS
XR_EXTERNAL_CAMERA_STATUS_CAPTURING_BIT_OCULUS = 0x00000010;
```

Flag Descriptions

- XR_EXTERNAL_CAMERA_STATUS_CONNECTED_BIT_OCULUS — External camera is connected
- XR_EXTERNAL_CAMERA_STATUS_CALIBRATING_BIT_OCULUS — External camera is undergoing calibration
- XR_EXTERNAL_CAMERA_STATUS_CALIBRATION_FAILED_BIT_OCULUS — External camera has tried and failed calibration
- XR_EXTERNAL_CAMERA_STATUS_CALIBRATED_BIT_OCULUS — External camera has tried and passed calibration
- XR_EXTERNAL_CAMERA_STATUS_CAPTURING_BIT_OCULUS — External camera is capturing

New Enum Constants

XR_MAX_EXTERNAL_CAMERA_NAME_SIZE_OCULUS defines the length of the field XrExternalCameraOCULUS ::name.

```
#define XR_MAX_EXTERNAL_CAMERA_NAME_SIZE_OCULUS 32
```

XrStructureType enumeration is extended with:

- XR_TYPE_EXTERNAL_CAMERA_OCULUS

New Enums

```
// Provided by XR_OCULUS_external_camera
typedef enum XrExternalCameraAttachedToDeviceOCULUS {
    XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_NONE_OCULUS = 0,
    XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_HMD_OCULUS = 1,
    XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_LTOUCH_OCULUS = 2,
    XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_RTOUCH_OCULUS = 3,
    XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_MAX_ENUM_OCULUS = 0x7FFFFFFF
} XrExternalCameraAttachedToDeviceOCULUS;
```

Enum	Description
XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_NONE_OCULUS	External camera is at a fixed point in LOCAL space
XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_HMD_OCULUS	External camera is attached to the HMD
XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_LTOUCH_OCULUS	External camera is attached to a left Touch controller
XR_EXTERNAL_CAMERA_ATTACHED_TO_DEVICE_RTOUCH_OCULUS	External camera is attached to a right Touch controller

New Structures

The XrExternalCameraIntrinsicsOCULUS structure is defined as:

```
// Provided by XR_OCULUS_external_camera
typedef struct XrExternalCameraIntrinsicsOCULUS {
    XrTime         lastChangeTime;
    XrFovf         fov;
    float          virtualNearPlaneDistance;
    float          virtualFarPlaneDistance;
    XrExtent2Di    imageSensorPixelResolution;
} XrExternalCameraIntrinsicsOCULUS;
```

Member Descriptions

- `lastChangeTime` is the `XrTime` when this camera's intrinsics last changed.
- `fov` is the XrFovf for this camera's viewport.
- `virtualNearPlaneDistance` is the near plane distance of the virtual camera used to match the external camera
- `virtualFarPlaneDistance` is the far plane distance of the virtual camera used to match the external camera
- `imageSensorPixelResolution` is the XrExtent2Di specifying the camera's resolution (in pixels).

Valid Usage (Implicit)

- The `XR_OCULUS_external_camera` extension **must** be enabled prior to using XrExternalCameraIntrinsicsOCULUS

The XrExternalCameraExtrinsicsOCULUS structure is defined as:

```
// Provided by XR_OCULUS_external_camera
typedef struct XrExternalCameraExtrinsicsOCULUS {
    XrTime                                  lastChangeTime;
    XrExternalCameraStatusFlagsOCULUS       cameraStatusFlags;
    XrExternalCameraAttachedToDeviceOCULUS  attachedToDevice;
    XrPosef                                 relativePose;
} XrExternalCameraExtrinsicsOCULUS;
```

Member Descriptions

- `lastChangeTime` is the `XrTime` when this camera's extrinsics last changed.
- `cameraStatusFlags` is the XrExternalCameraStatusFlagsOCULUS for this camera's status.
- `attachedToDevice` is the XrExternalCameraAttachedToDeviceOCULUS for the device this camera is attached to
- `relativePose` is the XrPosef for offset of the camera from the device that the camera is attached to

Valid Usage (Implicit)

- The XR_OCULUS_external_camera extension **must** be enabled prior to using XrExternalCameraExtrinsicsOCULUS
- cameraStatusFlags **must** be 0 or a valid combination of XrExternalCameraStatusFlagBitsOCULUS values
- attachedToDevice **must** be a valid XrExternalCameraAttachedToDeviceOCULUS value

The XrExternalCameraOCULUS structure is defined as:

```
// Provided by XR_OCULUS_external_camera
typedef struct XrExternalCameraOCULUS {
    XrStructureType                     type;
    const void*                         next;
    char                                name[XR_MAX_EXTERNAL_CAMERA_NAME_SIZE_OCULUS];
    XrExternalCameraIntrinsicsOCULUS    intrinsics;
    XrExternalCameraExtrinsicsOCULUS    extrinsics;
} XrExternalCameraOCULUS;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- name is a null-terminated UTF-8 string containing a camera identifier: VID (vendor ID), PID (product ID), and serial number
- intrinsics is the XrExternalCameraIntrinsicsOCULUS for the camera
- extrinsics is the XrExternalCameraExtrinsicsOCULUS for the camera

Valid Usage (Implicit)

- The XR_OCULUS_external_camera extension **must** be enabled prior to using XrExternalCameraOCULUS
- type **must** be XR_TYPE_EXTERNAL_CAMERA_OCULUS
- next **must** be NULL or a valid pointer to the next structure in a structure chain

New Functions

The xrEnumerateExternalCamerasOCULUS function enumerates all the external cameras that are supported by the runtime, it is defined as:

```
// Provided by XR_OCULUS_external_camera
XrResult xrEnumerateExternalCamerasOCULUS(
    XrSession                                   session,
    uint32_t                                    cameraCapacityInput,
    uint32_t*                                   cameraCountOutput,
    XrExternalCameraOCULUS*                     cameras);
```

Parameter Descriptions

- `session` is the XrSession to query the external cameras in
- `cameraCapacityInput` is the capacity of the `cameras` array, or 0 to indicate a request to retrieve the required capacity.
- `cameraCountOutput` is filled in by the runtime with the count of `cameras` written or the required capacity in the case that `cameraCapacityInput` is insufficient.
- `cameras` is an array of XrExternalCameraOCULUS filled in by the runtime which contains all the available external cameras, but **can** be `NULL` if `cameraCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `cameras` size.

Valid Usage (Implicit)

- The `XR_OCULUS_external_camera` extension **must** be enabled prior to calling xrEnumerateExternalCamerasOCULUS
- `session` **must** be a valid XrSession handle
- `cameraCountOutput` **must** be a pointer to a `uint32_t` value
- If `cameraCapacityInput` is not `0`, `cameras` **must** be a pointer to an array of `cameraCapacityInput` XrExternalCameraOCULUS structures

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

Extension and Version Dependencies

OpenXR 1.0

API Interactions

- Interacts with `XR_EXT_dpad_binding`
- Interacts with `XR_EXT_hand_interaction`
- Interacts with `XR_EXT_palm_pose`

Contributors

Haomiao Jiang, OPPO
Buyi Xu, OPPO
Yebao Cai, OPPO

Overview

This extension defines a new interaction profile for the OPPO Controller, including but not limited to OPPO MR Glasses Controller.

OPPO Controller interaction profile

Interaction profile path:

- */interaction_profiles/oppo/mr_controller_oppo*

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

This interaction profile represents the input sources and haptics on the OPPO Controller.

Supported component paths:

- On /user/hand/left only:
  - *.../input/x/click*
  - *.../input/x/touch*
  - *.../input/y/click*
  - *.../input/y/touch*
  - *.../input/menu/click*
  - *.../input/heartrate_oppo/value*
- On /user/hand/right only:
  - *.../input/a/click*

    - *.../input/a/touch*
    - *.../input/b/click*
    - *.../input/b/touch*
    - *.../input/home/click* (**may** not be available for application use)
- *.../input/squeeze/value*
- *.../input/trigger/touch*
- *.../input/trigger/value*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../input/thumbstick/click*
- *.../input/thumbstick/touch*
- *.../input/thumbstick*
- *.../input/thumbstick/x*
- *.../input/thumbstick/y*
- *.../output/haptic*

New Identifiers

- **heartrate_oppo**: OPPO MR Controller adds an optional heart rate sensor to monitor the heart beat rate of the user.

Input Path Descriptions

- **/input/heartrate_oppo/value** : Allow developers to access the heart beat per minute (BPM) of the user. The data would only be available with user's active consent.

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

12.191.1. Overview

This extension defines an API for the application to give optimization hints to the runtime for tracker domains.

For example, an application might be interested in tracking targets that are at a far distance from the camera which **may** increase tracking latency, while another application might be interested in minimizing power consumption at the cost of tracking accuracy. Targets are domains which are defined in XrTrackingOptimizationSettingsDomainQCOM.

This allows the application to tailor the tracking algorithms to specific use-cases and scene-scales in order to provide the best experience possible.

Summary: provide domain hints to the run-time about which parameters to optimize tracking for.

12.191.2. Setting Tracking Optimization Hints

The tracking optimization hints are expressed as a hint XrTrackingOptimizationSettingsHintQCOM.

```
// Provided by XR_QCOM_tracking_optimization_settings
typedef enum XrTrackingOptimizationSettingsDomainQCOM {
    XR_TRACKING_OPTIMIZATION_SETTINGS_DOMAIN_ALL_QCOM = 1,
    XR_TRACKING_OPTIMIZATION_SETTINGS_DOMAIN_MAX_ENUM_QCOM = 0x7FFFFFFF
} XrTrackingOptimizationSettingsDomainQCOM;
```

Enumerant Descriptions

- XR_TRACKING_OPTIMIZATION_SETTINGS_DOMAIN_ALL_QCOM — Setting applies to all QCOM tracking extensions.

```
// Provided by XR_QCOM_tracking_optimization_settings
typedef enum XrTrackingOptimizationSettingsHintQCOM {
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_NONE_QCOM = 0,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORITIZATION_QCOM = 1,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORITIZATION_QCOM = 2,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORITIZATION_QCOM = 3,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORITIZATION_QCOM = 4,
  // Provided by XR_QCOM_tracking_optimization_settings
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORIZATION_QCOM =
XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORITIZATION_QCOM,
  // Provided by XR_QCOM_tracking_optimization_settings
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORIZATION_QCOM =
XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORITIZATION_QCOM,
  // Provided by XR_QCOM_tracking_optimization_settings
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORIZATION_QCOM =
XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORITIZATION_QCOM,
  // Provided by XR_QCOM_tracking_optimization_settings
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORIZATION_QCOM =
XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORITIZATION_QCOM,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_MAX_ENUM_QCOM = 0x7FFFFFFF
} XrTrackingOptimizationSettingsHintQCOM;
```

Enumerant Descriptions

- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_NONE_QCOM — Used by the application to indicate that it does not have a preference to optimize for. The run-time is understood to choose a balanced approach.
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORITIZATION_QCOM — Used by the application to indicate that it prefers tracking to be optimized for long range, possibly at the expense of competing interests.
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORITIZATION_QCOM — Used by the application to indicate that it prefers tracking to be optimized for close range, possibly at the expense of competing interests.
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORITIZATION_QCOM — Used by the application to indicate that it prefers tracking to be optimized for low power consumption, possibly at the expense of competing interests.
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORITIZATION_QCOM — Used by the application to indicate that it prefers tracking to be optimized for increased tracking performance, possibly at the cost of increased power consumption.
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORIZATION_QCOM — Backward-compatibility alias containing typo. (Added by the XR_QCOM_tracking_optimization_settings extension)
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORIZATION_QCOM — Backward-compatibility alias containing typo. (Added by the XR_QCOM_tracking_optimization_settings extension)
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORIZATION_QCOM — Backward-compatibility alias containing typo. (Added by the XR_QCOM_tracking_optimization_settings extension)
- XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORIZATION_QCOM — Backward-compatibility alias containing typo. (Added by the XR_QCOM_tracking_optimization_settings extension)

The xrSetTrackingOptimizationSettingsHintQCOM function is defined as:

```
// Provided by XR_QCOM_tracking_optimization_settings
XrResult xrSetTrackingOptimizationSettingsHintQCOM(
    XrSession                                   session,
    XrTrackingOptimizationSettingsDomainQCOM    domain,
    XrTrackingOptimizationSettingsHintQCOM      hint);
```

Parameter Descriptions

- `session` is a valid XrSession handle.
- `domain` is the tracking domain for which the hint is applied
- `hint` is the hint to be applied

The XR runtime behaves as if `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_NONE_QCOM` was submitted if the application does not provide a hint.

The XR runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the application sets a domain or hint not part of XrTrackingOptimizationSettingsDomainQCOM or XrTrackingOptimizationSettingsHintQCOM.

A hint is typically set before a domain handle is created. If hints are set more than once from one or concurrent sessions, the runtime **may** accommodate the first hint it received and return `XR_ERROR_HINT_ALREADY_SET_QCOM` for any subsequent calls made.

If the application destroys the active domain handle associated with the hint, the runtime **may** behave as if `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_NONE_QCOM` was set. In this scenario, the runtime **should** accommodate new valid hints that **may** be set for the same domain.

Valid Usage (Implicit)

- The `XR_QCOM_tracking_optimization_settings` extension **must** be enabled prior to calling xrSetTrackingOptimizationSettingsHintQCOM
- `session` **must** be a valid XrSession handle
- `domain` **must** be a valid XrTrackingOptimizationSettingsDomainQCOM value
- `hint` **must** be a valid XrTrackingOptimizationSettingsHintQCOM value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_HINT_ALREADY_SET_QCOM
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

12.191.3. Example of setting a tracking optimization hint

```
XrInstance instance;  // previously initialized
XrSession session;    // previously initialized

// Get function pointer for xrSetTrackingOptimizationSettingsHintQCOM
PFN_xrSetTrackingOptimizationSettingsHintQCOM pfnSetTrackingOptimizationSettingsHintQCOM;
CHK_XR(xrGetInstanceProcAddr(instance, "xrSetTrackingOptimizationSettingsHintQCOM",
    (PFN_xrVoidFunction*)(&pfnSetTrackingOptimizationSettingsHintQCOM)));

pfnSetTrackingOptimizationSettingsHintQCOM(session,
    XR_TRACKING_OPTIMIZATION_SETTINGS_DOMAIN_ALL_QCOM,
    XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORITIZATION_QCOM);

// perform tracking while prioritizing long range tracking
```

12.191.4. New Commands

- xrSetTrackingOptimizationSettingsHintQCOM

12.191.5. New Enums

- XrTrackingOptimizationSettingsDomainQCOM
- XrTrackingOptimizationSettingsHintQCOM

12.191.6. New Enum Constants

- `XR_QCOM_TRACKING_OPTIMIZATION_SETTINGS_EXTENSION_NAME`
- `XR_QCOM_tracking_optimization_settings_SPEC_VERSION`
- Extending XrResult:
  - `XR_ERROR_HINT_ALREADY_SET_QCOM`
- Extending XrTrackingOptimizationSettingsHintQCOM:
  - `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_CLOSE_RANGE_PRIORIZATION_QCOM`
  - `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_HIGH_POWER_PRIORIZATION_QCOM`
  - `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LONG_RANGE_PRIORIZATION_QCOM`
  - `XR_TRACKING_OPTIMIZATION_SETTINGS_HINT_LOW_POWER_PRIORIZATION_QCOM`

12.192.1. Overview

This extension allows applications to specify the color space of swapchain images and to enumerate the color spaces supported by the session.

12.192.2. Enumerating Color Spaces

The xrEnumerateColorSpacesSONY function is defined as:

```
// Provided by XR_SONY_swapchain_color_space
XrResult xrEnumerateColorSpacesSONY(
    XrSession                                   session,
    const XrColorSpacesEnumerateInfoSONY*       enumerateInfo,
    uint32_t                                    colorSpaceCapacityInput,
    uint32_t*                                   colorSpaceCountOutput,
    XrColorSpaceSONY*                           colorSpaces);
```

Parameter Descriptions

- `session` is the session that enumerates the supported color spaces.
- `enumerateInfo` is a pointer to an XrColorSpacesEnumerateInfoSONY that specifies the swapchain format to query.
- `colorSpaceCapacityInput` is the capacity of the `colorSpaces` array, or 0 to retrieve the required capacity.
- `colorSpaceCountOutput` is a pointer to the count of XrColorSpaceSONY `colorSpaces` written, or a pointer to the required capacity in the case that `colorSpaceCapacityInput` is insufficient.
- `colorSpaces` is a pointer to an array of XrColorSpaceSONY color spaces, but **can** be `NULL` if `colorSpaceCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `colorSpaces` size.

xrEnumerateColorSpacesSONY enumerates the color spaces that the session supports for the swapchain format specified in the XrColorSpacesEnumerateInfoSONY.

The runtime **may** return different color spaces depending on the swapchain format.

The runtime **must** not return any color space other than `XR_COLOR_SPACE_SRGB_NONLINEAR_SONY` for API-specific sRGB formats (e.g. `DXGI_FORMAT_R8G8B8A8_UNORM_SRGB`, `GL_SRGB8_ALPHA8`, `VK_FORMAT_R8G8B8A8_SRGB`).

The runtime **must** return 0 in `colorSpaceCountOutput` for swapchain image formats that do not have a meaningful color space (e.g. depth or stencil image formats).

The runtime **must** return `XR_ERROR_SWAPCHAIN_FORMAT_UNSUPPORTED` if the swapchain format is unsupported.

The runtime **must** always return identical buffer contents for a given swapchain format from this enumeration for the lifetime of the session.

Valid Usage (Implicit)

- The `XR_SONY_swapchain_color_space` extension **must** be enabled prior to calling xrEnumerateColorSpacesSONY
- `session` **must** be a valid XrSession handle
- `enumerateInfo` **must** be a pointer to a valid XrColorSpacesEnumerateInfoSONY structure
- `colorSpaceCountOutput` **must** be a pointer to a `uint32_t` value
- If `colorSpaceCapacityInput` is not `0`, `colorSpaces` **must** be a pointer to an array of `colorSpaceCapacityInput` XrColorSpaceSONY values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SWAPCHAIN_FORMAT_UNSUPPORTED
- XR_ERROR_VALIDATION_FAILURE

The XrColorSpacesEnumerateInfoSONY structure is defined as:

```
// Provided by XR_SONY_swapchain_color_space
typedef struct XrColorSpacesEnumerateInfoSONY {
    XrStructureType    type;
    const void*        next;
    int64_t            format;
} XrColorSpacesEnumerateInfoSONY;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- format is the swapchain image format to query. format **must** be one of the formats enumerated by xrEnumerateSwapchainFormats.

XrColorSpacesEnumerateInfoSONY specifies the swapchain image format when calling xrEnumerateColorSpacesSONY.

Valid Usage (Implicit)

- The XR_SONY_swapchain_color_space extension **must** be enabled prior to using XrColorSpacesEnumerateInfoSONY
- type **must** be XR_TYPE_COLOR_SPACES_ENUMERATE_INFO_SONY
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The possible color spaces are specified by the XrColorSpaceSONY enumeration.

```
// Provided by XR_SONY_swapchain_color_space
typedef enum XrColorSpaceSONY {
    XR_COLOR_SPACE_SRGB_NONLINEAR_SONY = 0,
    XR_COLOR_SPACE_DISPLAY_P3_LINEAR_SONY = 1,
    XR_COLOR_SPACE_DISPLAY_P3_NONLINEAR_SONY = 2,
    XR_COLOR_SPACE_DCI_P3_LINEAR_SONY = 3,
    XR_COLOR_SPACE_DCI_P3_NONLINEAR_SONY = 4,
    XR_COLOR_SPACE_EXTENDED_SRGB_LINEAR_SONY = 5,
    XR_COLOR_SPACE_BT709_LINEAR_SONY = 6,
    XR_COLOR_SPACE_BT709_NONLINEAR_SONY = 7,
    XR_COLOR_SPACE_BT2020_LINEAR_SONY = 8,
    XR_COLOR_SPACE_BT2020_PQ_SONY = 9,
    XR_COLOR_SPACE_BT2020_HLG_SONY = 10,
    XR_COLOR_SPACE_MAX_ENUM_SONY = 0x7FFFFFFF
} XrColorSpaceSONY;
```

The enumerants have the following values:

Enum	Description
XR_COLOR_SPACE_SRGB_NONLINEAR_SONY	sRGB color space, encoded according to the sRGB specification.
XR_COLOR_SPACE_DISPLAY_P3_LINEAR_SONY	Display-P3 color space, encoded using a linear transfer function.
XR_COLOR_SPACE_DISPLAY_P3_NONLINEAR_SONY	Display-P3 color space, encoded according to the Display-P3 specification.
XR_COLOR_SPACE_DCI_P3_LINEAR_SONY	DCI-P3 color space, encoded using a linear transfer function.
XR_COLOR_SPACE_DCI_P3_NONLINEAR_SONY	DCI-P3 color space, encoded according to the DCI-P3 specification.
XR_COLOR_SPACE_EXTENDED_SRGB_LINEAR_SONY	Extended sRGB color space, encoded using a linear transfer function.

Enum	Description
XR_COLOR_SPACE_BT709_LINEAR_SONY	ITU-R BT.709 color space, encoded using a linear transfer function.
XR_COLOR_SPACE_BT709_NONLINEAR_SONY	ITU-R BT.709 color space, encoded according to the BT.709 specification.
XR_COLOR_SPACE_BT2020_LINEAR_SONY	ITU-R BT.2020 color space, encoded using a linear transfer function.
XR_COLOR_SPACE_BT2020_PQ_SONY	ITU-R BT.2020 color space, encoded according to the SMPTE ST 2084 Perceptual Quantizer (PQ) specification.
XR_COLOR_SPACE_BT2020_HLG_SONY	ITU-R BT.2020 color space, encoded according to the Hybrid Log Gamma (HLG) specification.

12.192.3. Specifying Swapchain Color Space

The XrSwapchainCreateInfoColorSpaceSONY structure is defined as:

```
// Provided by XR_SONY_swapchain_color_space
typedef struct XrSwapchainCreateInfoColorSpaceSONY {
    XrStructureType     type;
    const void*         next;
    XrColorSpaceSONY    colorSpace;
} XrSwapchainCreateInfoColorSpaceSONY;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- colorSpace is the color space of this swapchain. colorSpace **must** be one of the color spaces enumerated by xrEnumerateColorSpacesSONY for the swapchain image format specified by XrSwapchainCreateInfo::format.

XrSwapchainCreateInfoColorSpaceSONY **can** be provided in the next chain of XrSwapchainCreateInfo when calling xrCreateSwapchain to specify the color space and encoding for the new swapchain.

The color space specified by XrSwapchainCreateInfoColorSpaceSONY does not affect the encoding of the alpha component.

The color space specified at creation time is constant for the lifetime of the swapchain.

The runtime **must** return XR_ERROR_VALIDATION_FAILURE from xrCreateSwapchain if the colorSpace is not enumerated by xrEnumerateColorSpacesSONY for the swapchain image format specified by XrSwapchainCreateInfo::format.

Valid Usage (Implicit)

- The XR_SONY_swapchain_color_space extension **must** be enabled prior to using XrSwapchainCreateInfoColorSpaceSONY
- type **must** be XR_TYPE_SWAPCHAIN_CREATE_INFO_COLOR_SPACE_SONY
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- colorSpace **must** be a valid XrColorSpaceSONY value

Overview

This extension augments the XR_EXT_hand_tracking extension to enable applications to request the default set of 26 hand joints, with the addition of a joint representing the user's elbow.

The application **must** also enable the XR_EXT_hand_tracking extension in order to use this extension.

New joint set

This extension extends the XrHandJointSetEXT enumeration with a new member XR_HAND_JOINT_SET_HAND_WITH_FOREARM_ULTRALEAP. This joint set is the same as the XR_HAND_JOINT_SET_DEFAULT_EXT, plus a joint representing the user's elbow, XR_HAND_FOREARM_JOINT_ELBOW_ULTRALEAP.

```
// Provided by XR_ULTRALEAP_hand_tracking_forearm
typedef enum XrHandForearmJointULTRALEAP {
    XR_HAND_FOREARM_JOINT_PALM_ULTRALEAP = 0,
    XR_HAND_FOREARM_JOINT_WRIST_ULTRALEAP = 1,
    XR_HAND_FOREARM_JOINT_THUMB_METACARPAL_ULTRALEAP = 2,
    XR_HAND_FOREARM_JOINT_THUMB_PROXIMAL_ULTRALEAP = 3,
    XR_HAND_FOREARM_JOINT_THUMB_DISTAL_ULTRALEAP = 4,
    XR_HAND_FOREARM_JOINT_THUMB_TIP_ULTRALEAP = 5,
    XR_HAND_FOREARM_JOINT_INDEX_METACARPAL_ULTRALEAP = 6,
    XR_HAND_FOREARM_JOINT_INDEX_PROXIMAL_ULTRALEAP = 7,
    XR_HAND_FOREARM_JOINT_INDEX_INTERMEDIATE_ULTRALEAP = 8,
    XR_HAND_FOREARM_JOINT_INDEX_DISTAL_ULTRALEAP = 9,
    XR_HAND_FOREARM_JOINT_INDEX_TIP_ULTRALEAP = 10,
    XR_HAND_FOREARM_JOINT_MIDDLE_METACARPAL_ULTRALEAP = 11,
    XR_HAND_FOREARM_JOINT_MIDDLE_PROXIMAL_ULTRALEAP = 12,
    XR_HAND_FOREARM_JOINT_MIDDLE_INTERMEDIATE_ULTRALEAP = 13,
    XR_HAND_FOREARM_JOINT_MIDDLE_DISTAL_ULTRALEAP = 14,
    XR_HAND_FOREARM_JOINT_MIDDLE_TIP_ULTRALEAP = 15,
    XR_HAND_FOREARM_JOINT_RING_METACARPAL_ULTRALEAP = 16,
    XR_HAND_FOREARM_JOINT_RING_PROXIMAL_ULTRALEAP = 17,
    XR_HAND_FOREARM_JOINT_RING_INTERMEDIATE_ULTRALEAP = 18,
    XR_HAND_FOREARM_JOINT_RING_DISTAL_ULTRALEAP = 19,
    XR_HAND_FOREARM_JOINT_RING_TIP_ULTRALEAP = 20,
    XR_HAND_FOREARM_JOINT_LITTLE_METACARPAL_ULTRALEAP = 21,
    XR_HAND_FOREARM_JOINT_LITTLE_PROXIMAL_ULTRALEAP = 22,
    XR_HAND_FOREARM_JOINT_LITTLE_INTERMEDIATE_ULTRALEAP = 23,
    XR_HAND_FOREARM_JOINT_LITTLE_DISTAL_ULTRALEAP = 24,
    XR_HAND_FOREARM_JOINT_LITTLE_TIP_ULTRALEAP = 25,
    XR_HAND_FOREARM_JOINT_ELBOW_ULTRALEAP = 26,
    XR_HAND_FOREARM_JOINT_MAX_ENUM_ULTRALEAP = 0x7FFFFFFF
} XrHandForearmJointULTRALEAP;
```

Note

The first XR_HAND_JOINT_COUNT_EXT members of XrHandForearmJointULTRALEAP are identical to the members of XrHandJointEXT and **can** be used interchangeably.

The XR_HAND_FOREARM_JOINT_ELBOW_ULTRALEAP joint represents the center of an elbow and is orientated with the backwards (+Z) direction parallel to the forearm and points away from the hand.

The up (+Y) direction is pointing out of the dorsal side of the forearm. The X direction is perpendicular to Y and Z and follows the right hand rule.

```
// Provided by XR_ULTRALEAP_hand_tracking_forearm
#define XR_HAND_FOREARM_JOINT_COUNT_ULTRALEAP 27
```

XR_HAND_FOREARM_JOINT_COUNT_ULTRALEAP defines the number of hand joint enumerants defined in XrHandForearmJointULTRALEAP.

Overview

This extension allows the application to control the threshold and haptic feedback applied to an analog to digital conversion. See XrInteractionProfileAnalogThresholdVALVE for more information.

Applications **should** also enable the `XR_KHR_binding_modification` extension to be able to define multiple thresholds.

New Object Types

New Flag Types

New Enum Constants

New Enums

New Structures

The XrInteractionProfileAnalogThresholdVALVE structure is an input struct that defines thresholds and haptic feedback behavior for action bindings and **should** be added to the XrBindingModificationsKHR::`bindingModifications` array of the XrBindingModificationsKHR structure (See `XR_KHR_binding_modification` extension).

```
// Provided by XR_VALVE_analog_threshold
typedef struct XrInteractionProfileAnalogThresholdVALVE {
    XrStructureType             type;
    const void*                 next;
    XrAction                    action;
    XrPath                      binding;
    float                       onThreshold;
    float                       offThreshold;
    const XrHapticBaseHeader*   onHaptic;
    const XrHapticBaseHeader*   offHaptic;
} XrInteractionProfileAnalogThresholdVALVE;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `action` is the handle of an action in the suggested binding list.
- `binding` is the input path used for the specified action in the suggested binding list.
- `onThreshold` is the value between 0.0 and 1.0 at which the runtime **must** consider the binding to be true. The binding must remain true until the input analog value falls below `offThreshold`.
- `offThreshold` is the value between 0.0 and 1.0 at which the runtime **must** consider the binding to be false if it was previous true.
- `onHaptic` is the haptic output that the runtime **must** trigger when the binding changes from false to true. If this field is NULL, the runtime **must** not trigger any haptic output on the threshold. This field **can** point to any supported sub-type of XrHapticBaseHeader.
- `offHaptic` is the haptic output that the runtime **must** trigger when the binding changes from true to false. If this field is NULL, the runtime **must** not trigger any haptic output on the threshold. This field **can** point to any supported sub-type of XrHapticBaseHeader.

Applications can also chain a single XrInteractionProfileAnalogThresholdVALVE structure on the next chain of any xrSuggestInteractionProfileBindings call. Runtimes **must** support this kind of chaining. This method of specifying analog thresholds is deprecated however, and should not be used by any new applications.

If a threshold struct is present for a given conversion, the runtime **must** use those thresholds instead of applying its own whenever it is using the binding suggested by the application.

`onThreshold` and `offThreshold` permit allow the application to specify that it wants hysteresis to be applied to the threshold operation. If `onThreshold` is smaller than `offThreshold`, the runtime **must**

return XR_ERROR_VALIDATION_FAILURE.

onHaptic and offHaptic allow the application to specify that it wants automatic haptic feedback to be generated when the boolean output of the threshold operation changes from false to true or vice versa. If these fields are not NULL, the runtime **must** trigger a haptic output with the specified characteristics. If the device has multiple haptic outputs, the runtime **should** use the haptic output that is most appropriate for the specified input path.

If a suggested binding with action and binding is not in the binding list for this interaction profile, the runtime **must** return XR_ERROR_PATH_UNSUPPORTED.

Valid Usage (Implicit)

- The XR_VALVE_analog_threshold extension **must** be enabled prior to using XrInteractionProfileAnalogThresholdVALVE
- type **must** be XR_TYPE_INTERACTION_PROFILE_ANALOG_THRESHOLD_VALVE
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- action **must** be a valid XrAction handle
- If onHaptic is not NULL, onHaptic **must** be a pointer to a valid XrHapticBaseHeader-based structure. See also: XrHapticAmplitudeEnvelopeVibrationFB, XrHapticParametricVibrationEXT, XrHapticPcmVibrationFB, XrHapticVibration
- If offHaptic is not NULL, offHaptic **must** be a pointer to a valid XrHapticBaseHeader-based structure. See also: XrHapticAmplitudeEnvelopeVibrationFB, XrHapticParametricVibrationEXT, XrHapticPcmVibrationFB, XrHapticVibration

New Functions

Issues

Version History

- Revision 1, 2020-06-29 (Joe Ludwig)
  - Initial version.
- Revision 2, 2021-07-28 (Rune Berg)
  - Deprecate chaining of struct in XrInteractionProfileSuggestedBinding, applications should use XrBindingModificationsKHR defined in the XR_KHR_binding_modification extension instead.

Overview

This extension enables depth-based layer composition inside the compositor.

Core OpenXR specifies that layer compositing must happen in the layer submission order (as described in Compositing). However, an application may want to composite the final image against the other layers based on depth information for proper occlusion. Layers can now provide depth information that will be used to calculate occlusion between those layers, as well as with the environment depth estimator (`XR_VARJO_environment_depth_estimation`) when enabled.

This extension defines a new type, XrCompositionLayerDepthTestVARJO, which can be chained to XrCompositionLayerProjection in order to activate this functionality. An application must also specify a range where depth testing will happen, potentially covering only a subset of the full depth range.

Composition

Layer composition rules change when this extension is enabled.

If the application does not chain XrCompositionLayerDepthTestVARJO, "painter's algorithm" such as described in Compositing must be used for layer composition.

Overall, composition should be performed in the following way:

1. Layers must be composited in the submission order. The compositor must track the depth value nearest to the virtual camera. Initial value for the nearest depth should be infinity.
2. If the currently processed layer does not contain depth, compositor should composite the layer against the previous layers with "painter's algorithm" and move to the next layer.
3. If the layer depth or the active nearest depth fall inside the depth test range of the layer, the compositor must perform depth test against the layer and active depth. If the layer depth is less or equal than the active depth, layer is composited normally with the previous layers and active depth is updated to match the layer depth. Otherwise the layer pixel is discarded, and compositor should move to composite the next layer.

Example

Mixed reality applications may want to show hands on top of the rendered VR content. For this purpose the application should enable environment depth estimation (see `XR_VARJO_environment_depth_estimation` extension) and depth testing with range 0m to 1m.

The following code illustrates how to enable depth testing:

```
XrCompositionLayerProjection layer; // previously populated

XrCompositionLayerDepthTestVARJO depthTest {
    .type = XR_TYPE_COMPOSITION_LAYER_DEPTH_TEST_VARJO,
    .next = layer.next,
    .depthTestRangeNearZ = 0.0f, // in meters
    .depthTestRangeFarZ = 1.0f, // in meters
};
layer.next = &depthTest;
```

New Structures

Applications **can** enable depth testing by adding XrCompositionLayerDepthTestVARJO to the `next` chain for all XrCompositionLayerProjectionView structures in the given layer in addition to XrCompositionLayerDepthInfoKHR. Missing XrCompositionLayerDepthInfoKHR automatically disables the depth testing functionality.

The XrCompositionLayerDepthTestVARJO structure is defined as:

```
// Provided by XR_VARJO_composition_layer_depth_test
typedef struct XrCompositionLayerDepthTestVARJO {
    XrStructureType    type;
    const void*        next;
    float              depthTestRangeNearZ;
    float              depthTestRangeFarZ;
} XrCompositionLayerDepthTestVARJO;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `depthTestRangeNearZ` in a non-negative distance in meters that specifies the lower bound of the range where depth testing should be performed. Must be less than `depthTestRangeFarZ`. Value of zero means that there is no lower bound.
- `depthTestRangeFarZ` is a positive distance in meters that specifies the upper bound of the range where depth testing should be performed. Must be greater than `depthTestRangeNearZ`. Value of floating point positive infinity means that there is no upper bound.

Valid Usage (Implicit)

- The `XR_VARJO_composition_layer_depth_test` extension **must** be enabled prior to using XrCompositionLayerDepthTestVARJO
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_DEPTH_TEST_VARJO`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_COMPOSITION_LAYER_DEPTH_TEST_VARJO`

Overview

This extension provides a mechanism for enabling depth estimation of the environment in the runtime-supplied compositor. This is an extension to XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND mode to not only use the color but also depth for composition of the final image.

Mixed reality applications might want to mix real and virtual content based on the depth information for proper occlusion. XR hardware and runtime may offer various ways to estimate the depth of the environment inside the compositor. When this estimation is enabled, the compositor can generate properly occluded final image when layers are submitted with depth information (both XR_KHR_composition_layer_depth and XR_VARJO_composition_layer_depth_test).

This extension defines a new function, xrSetEnvironmentDepthEstimationVARJO, which **can** be used to toggle environment depth estimation in the compositor. Toggling depth estimation is an asynchronous

operation and the feature **may** not be activated immediately. Function can be called immediately after the session is created. Composition of the environment layer follows the rules as described in `XR_VARJO_composition_layer_depth_test`.

New Structures

The xrSetEnvironmentDepthEstimationVARJO function is defined as:

```
// Provided by XR_VARJO_environment_depth_estimation
XrResult xrSetEnvironmentDepthEstimationVARJO(
    XrSession                                   session,
    XrBool32                                    enabled);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `enabled` is a boolean that specifies whether depth estimation functionality should be activated. Compositor will disable depth estimation functionality if environment blend mode is not `XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND` and will enable the functionality when environment blend mode is set to `XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND`.

Valid Usage (Implicit)

- The `XR_VARJO_environment_depth_estimation` extension **must** be enabled prior to calling xrSetEnvironmentDepthEstimationVARJO
- `session` **must** be a valid XrSession handle

12.197.1. Overview

Varjo headsets provide extremely high pixel density displays in the center area of the display, blended with a high density display covering the rest of the field of view. If the application has to provide a single image per eye, that would cover the entire field of view, at the highest density it would be extremely resource intensive, and in fact impossible for the most powerful desktop GPUs to render in real time. So instead Varjo introduced the XR_VARJO_quad_views extension enabling the application to provide two separate images for the two screen areas, resulting in a significant reduction in processing, for pixels that could not even been seen.

This extension goes a step further by enabling the application to only generate the density that can be seen by the user, which is another big reduction compared to the density that can be displayed, using dedicated eye tracking.

This extension requires XR_VARJO_quad_views extension to be enabled.

An application using this extension to enable foveated rendering will take the following steps to prepare:

1. Enable XR_VARJO_quad_views and XR_VARJO_foveated_rendering extensions.
2. Query system properties in order to determine if system supports foveated rendering.
3. Query texture sizes for foveated rendering.

In the render loop, for each frame, an application using this extension **should**

1. Check if rendering gaze is available using xrLocateSpace.
2. Enable foveated rendering when xrLocateViews is called.

12.197.2. Inspect system capability

An application **can** inspect whether the system is capable of foveated rendering by chaining an XrSystemFoveatedRenderingPropertiesVARJO structure to the XrSystemProperties structure when

calling xrGetSystemProperties.

```
// Provided by XR_VARJO_foveated_rendering
typedef struct XrSystemFoveatedRenderingPropertiesVARJO {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsFoveatedRendering;
} XrSystemFoveatedRenderingPropertiesVARJO;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsFoveatedRendering` is an `XrBool32`, indicating if current system is capable of performoning foveated rendering.

The runtime **should** return `XR_TRUE` for `supportsFoveatedRendering` when rendering gaze is available in the system. An application **should** avoid using foveated rendering functionality when `supportsFoveatedRendering` is `XR_FALSE`.

Valid Usage (Implicit)

- The `XR_VARJO_foveated_rendering` extension **must** be enabled prior to using XrSystemFoveatedRenderingPropertiesVARJO
- `type` **must** be `XR_TYPE_SYSTEM_FOVEATED_RENDERING_PROPERTIES_VARJO`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

12.197.3. Determine foveated texture sizes

Foveated textures **may** have different sizes and aspect ratio compared to non-foveated textures. In order to determine recommended foveated texture size, an application **can** chain XrFoveatedViewConfigurationViewVARJO to XrViewConfigurationView and set `foveatedRenderingActive` to `XR_TRUE`. Since an application using foveated rendering with this extension has to render four views, `XR_VARJO_quad_views` **must** be enabled along with this extension when XrInstance is created.

First and second views are non foveated views (covering whole field of view of HMD), third (left eye) and fourth (right eye) are foveated e.g. following gaze.

```
// Provided by XR_VARJO_foveated_rendering
typedef struct XrFoveatedViewConfigurationViewVARJO {
    XrStructureType    type;
    void*              next;
    XrBool32           foveatedRenderingActive;
} XrFoveatedViewConfigurationViewVARJO;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `foveatedRenderingActive` is an `XrBool32`, indicating if the runtime should return foveated view configuration view.

Valid Usage (Implicit)

- The `XR_VARJO_foveated_rendering` extension **must** be enabled prior to using XrFoveatedViewConfigurationViewVARJO
- `type` **must** be `XR_TYPE_FOVEATED_VIEW_CONFIGURATION_VIEW_VARJO`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

For example:

```
XrInstance instance; // previously populated
XrSystemId systemId; // previously populated
XrViewConfigurationType viewConfigType; // Select
XR_VIEW_CONFIGURATION_TYPE_PRIMARY_QUAD_VARJO

XrSystemFoveatedRenderingPropertiesVARJO foveatedRenderingProperties {
  .type = XR_TYPE_SYSTEM_FOVEATED_RENDERING_PROPERTIES_VARJO,
};
XrSystemProperties systemProperties {
  .type = XR_TYPE_SYSTEM_PROPERTIES,
  .next = &foveatedRenderingProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));

uint32_t viewCount = 0;
CHK_XR(xrEnumerateViewConfigurationViews(instance, systemId, viewConfigType, 0,
&viewCount, nullptr));
// Non-foveated rendering views dimensions
std::vector<XrViewConfigurationView> configViews(viewCount, {
  .type = XR_TYPE_VIEW_CONFIGURATION_VIEW,
});
CHK_XR(xrEnumerateViewConfigurationViews(instance, systemId, viewConfigType, viewCount,
&viewCount, configViews.data()));

// Foveated rendering views dimensions
std::vector<XrViewConfigurationView> foveatedViews;
if (foveatedRenderingProperties.supportsFoveatedRendering && viewConfigType ==
XR_VIEW_CONFIGURATION_TYPE_PRIMARY_QUAD_VARJO) {
  std::vector<XrFoveatedViewConfigurationViewVARJO> requestFoveatedConfig(4, {
    .type = XR_TYPE_FOVEATED_VIEW_CONFIGURATION_VIEW_VARJO,
    .next = nullptr,
    .foveatedRenderingActive = XR_TRUE,
  });
  foveatedViews = std::vector<XrViewConfigurationView>(4, {
    .type = XR_TYPE_VIEW_CONFIGURATION_VIEW,
  });
  for (size_t i = 0; i < 4; i++) {
    foveatedViews[i].next = &requestFoveatedConfig[i];
  }
  CHK_XR(xrEnumerateViewConfigurationViews(instance, systemId, viewConfigType, viewCount,
&viewCount, foveatedViews.data()));
}
```

Example 3. Note

Applications using this extension are encouraged to create two sets of swapchains or one big enough set of swapchains and two sets of viewports. One set will be used when rendering gaze is not available and other one will be used when foveated rendering and rendering gaze is available. Using foveated textures **may** not provide optimal visual quality when rendering gaze is not available.

12.197.4. Rendering gaze status

Extension defines new reference space type - `XR_REFERENCE_SPACE_TYPE_COMBINED_EYE_VARJO` which **should** be used to determine whether rendering gaze is available. After calling xrLocateSpace, application **should** inspect `XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT` bit. If it's set, rendering gaze is available otherwise not.

```
XrSession session; // previously populated

// Create needed spaces
XrSpace viewSpace {XR_NULL_HANDLE};
XrReferenceSpaceCreateInfo createViewSpaceInfo {
  .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
  .referenceSpaceType = XR_REFERENCE_SPACE_TYPE_VIEW,
  .poseInReferenceSpace = {
    .orientation = {
      .w = 1.0f,
    },
  },
};
CHK_XR(xrCreateReferenceSpace(session, &createViewSpaceInfo, &viewSpace));

XrSpace renderGazeSpace {XR_NULL_HANDLE};
XrReferenceSpaceCreateInfo createReferenceSpaceInfo {
  .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
  .referenceSpaceType = XR_REFERENCE_SPACE_TYPE_COMBINED_EYE_VARJO,
  .poseInReferenceSpace = {
    .orientation = {
      .w = 1.0f,
    },
  },
};
CHK_XR(xrCreateReferenceSpace(session, &createReferenceSpaceInfo, &renderGazeSpace));

// ...
// in frame loop
// ...
```

```
XrFrameState frameState; // previously populated by xrWaitFrame

// Query rendering gaze status
XrSpaceLocation renderGazeLocation {
  .type = XR_TYPE_SPACE_LOCATION,
};
CHK_XR(xrLocateSpace(renderGazeSpace, viewSpace, frameState.predictedDisplayTime,
&renderGazeLocation));

const bool foveationActive = (renderGazeLocation.locationFlags &
XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT) != 0;

if (foveationActive) {
  // Rendering gaze is available
} else {
  // Rendering gaze is not available
}
```

12.197.5. Request foveated field of view

For each frame, the application indicates if the runtime will return foveated or non-foveated field of view. This is done by chaining XrViewLocateFoveatedRenderingVARJO to XrViewLocateInfo.

```
// Provided by XR_VARJO_foveated_rendering
typedef struct XrViewLocateFoveatedRenderingVARJO {
    XrStructureType    type;
    const void*        next;
    XrBool32           foveatedRenderingActive;
} XrViewLocateFoveatedRenderingVARJO;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `foveatedRenderingActive` is an `XrBool32`, indicating if runtime should return foveated FoV.

The runtime **must** return foveated field of view when `foveatedRenderingActive` is `XR_TRUE`.

Valid Usage (Implicit)

- The XR_VARJO_foveated_rendering extension **must** be enabled prior to using XrViewLocateFoveatedRenderingVARJO
- type **must** be XR_TYPE_VIEW_LOCATE_FOVEATED_RENDERING_VARJO
- next **must** be NULL or a valid pointer to the next structure in a structure chain

```
// ...
// in frame loop
// ...

XrSession session; // previously populated
XrSpace appSpace; // previously populated
XrFrameState frameState; // previously populated by xrWaitFrame
XrViewConfigurationType viewConfigType; // previously populated
std::vector<XrView> views; // previously populated/resized to the correct size
bool foveationActive; // previously populated, as in the previous example

XrViewState viewState {
  .type = XR_TYPE_VIEW_STATE,
};
uint32_t viewCapacityInput = static_cast<uint32_t>(views.size());
uint32_t viewCountOutput;

XrViewLocateFoveatedRenderingVARJO viewLocateFoveatedRendering {
  .type = XR_TYPE_VIEW_LOCATE_FOVEATED_RENDERING_VARJO,
  .foveatedRenderingActive = foveationActive,
};

XrViewLocateInfo viewLocateInfo {
  .type = XR_TYPE_VIEW_LOCATE_INFO,
  .next = &viewLocateFoveatedRendering,
  .viewConfigurationType = viewConfigType,
  .displayTime = frameState.predictedDisplayTime,
  .space = appSpace,
};

CHK_XR(xrLocateViews(session, &viewLocateInfo, &viewState, viewCapacityInput,
&viewCountOutput, views.data()));
```

New Structures

- XrViewLocateFoveatedRenderingVARJO

- XrFoveatedViewConfigurationViewVARJO
- XrSystemFoveatedRenderingPropertiesVARJO

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_VIEW_LOCATE_FOVEATED_RENDERING_VARJO`
- `XR_TYPE_FOVEATED_VIEW_CONFIGURATION_VIEW_VARJO`
- `XR_TYPE_SYSTEM_FOVEATED_RENDERING_PROPERTIES_VARJO`

XrReferenceSpaceType enumeration is extended with:

- `XR_REFERENCE_SPACE_TYPE_COMBINED_EYE_VARJO`

Version History

12.198.1. Overview

Varjo Markers are physical markers tracked by the video cameras of the HMD. Different types of markers **can** be used for different purposes. As an example, Varjo Markers **can** be used as cheap replacements for electronic trackers. The cost per printed tracker is significantly lower and the markers require no power to function.

This extension provides the tracking interface to a set of marker types and sizes. Markers **can** be printed out from the PDF documents and instructions freely available at https://developer.varjo.com/docs/get-started/varjo-markers#printing-varjo-markers. Note that the printed marker **must** have the exact physical size for its ID.

Object markers are used to track static or dynamic objects in the user environment. You **may** use object markers in both XR and VR applications. Each marker has a unique ID, and you **must** not use the same physical marker more than once in any given environment. For added precision, an application **may** use multiple markers to track a single object. For example, you could track a monitor by placing a marker in each corner.

There is a set of marker IDs recognized by runtime and if the application uses ID which is not in the set then runtime **must** return `XR_ERROR_MARKER_ID_INVALID_VARJO`.

New Object Types

New Flag Types

New Enums

New Functions

The xrSetMarkerTrackingVARJO function is defined as:

```
// Provided by XR_VARJO_marker_tracking
XrResult xrSetMarkerTrackingVARJO(
    XrSession                                   session,
    XrBool32                                    enabled);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `enabled` is the flag to enable or disable marker tracking.

The xrSetMarkerTrackingVARJO function enables or disables marker tracking functionality. As soon as feature is become disabled all trackable markers become inactive and corresponding events will be generated. An application **may** call any of the functions in this extension regardless if the marker tracking functionality is enabled or disabled.

Valid Usage (Implicit)

- The `XR_VARJO_marker_tracking` extension **must** be enabled prior to calling xrSetMarkerTrackingVARJO
- `session` **must** be a valid XrSession handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FEATURE_UNSUPPORTED`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`

The xrSetMarkerTrackingTimeoutVARJO function is defined as:

```
// Provided by XR_VARJO_marker_tracking
XrResult xrSetMarkerTrackingTimeoutVARJO(
    XrSession                                   session,
    uint64_t                                    markerId,
    XrDuration                                  timeout);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `markerId` is the unique identifier of the marker for which the timeout will be updated.
- `timeout` is the desired lifetime duration for a specified marker.

The xrSetMarkerTrackingTimeoutVARJO function sets a desired lifetime duration for a specified marker. The default value is XR_NO_DURATION. Negative value will be clamped to XR_NO_DURATION. It defines the time period during which the runtime **must** keep returning poses of previously tracked markers. The tracking may be lost if the marker went outside of the trackable field of view. In this case the runtime still will try to predict marker's pose for the timeout period. The runtime **must** return `XR_ERROR_MARKER_ID_INVALID_VARJO` if the supplied `markerId` is invalid.

Valid Usage (Implicit)

- The `XR_VARJO_marker_tracking` extension **must** be enabled prior to calling xrSetMarkerTrackingTimeoutVARJO
- `session` **must** be a valid XrSession handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_ID_INVALID_VARJO
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST

The xrSetMarkerTrackingPredictionVARJO function is defined as:

```
// Provided by XR_VARJO_marker_tracking
XrResult xrSetMarkerTrackingPredictionVARJO(
    XrSession                                   session,
    uint64_t                                    markerId,
    XrBool32                                    enable);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- markerId is the unique identifier of the marker which should be tracked with prediction.
- enable is whether to enable the prediction feature.

The xrSetMarkerTrackingPredictionVARJO function enables or disables the prediction feature for a specified marker. By default, markers are created with disabled prediction. This works well for markers that are supposed to be stationary. The prediction **can** be used to improve tracking of movable markers. The runtime **must** return XR_ERROR_MARKER_ID_INVALID_VARJO if the supplied markerId is invalid.

Valid Usage (Implicit)

- The XR_VARJO_marker_tracking extension **must** be enabled prior to calling xrSetMarkerTrackingPredictionVARJO
- session **must** be a valid XrSession handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_ID_INVALID_VARJO
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST

The xrGetMarkerSizeVARJO function is defined as:

```
// Provided by XR_VARJO_marker_tracking
XrResult xrGetMarkerSizeVARJO(
    XrSession                                   session,
    uint64_t                                    markerId,
    XrExtent2Df*                                size);
```

Parameter Descriptions

- session is an XrSession handle previously created with xrCreateSession.
- markerId is the unique identifier of the marker for which size is requested.
- size is pointer to the size to populate by the runtime with the physical size of plane marker in meters.

The xrGetMarkerSizeVARJO function retrieves the height and width of an active marker. The runtime

must return XR_ERROR_MARKER_NOT_TRACKED_VARJO if marker tracking functionality is disabled or the marker with given markerId is inactive. The runtime **must** return XR_ERROR_MARKER_ID_INVALID_VARJO if the supplied markerId is invalid.

Valid Usage (Implicit)

- The XR_VARJO_marker_tracking extension **must** be enabled prior to calling xrGetMarkerSizeVARJO
- session **must** be a valid XrSession handle
- size **must** be a pointer to an XrExtent2Df structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_MARKER_ID_INVALID_VARJO
- XR_ERROR_MARKER_NOT_TRACKED_VARJO
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST

The xrCreateMarkerSpaceVARJO function is defined as:

```
// Provided by XR_VARJO_marker_tracking
XrResult xrCreateMarkerSpaceVARJO(
    XrSession                                   session,
    const XrMarkerSpaceCreateInfoVARJO*         createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `createInfo` is the structure containing information about how to create the space based on marker.
- `space` is a pointer to a handle in which the created XrSpace is returned.

The xrCreateMarkerSpaceVARJO function creates marker XrSpace for pose relative to the marker specified in XrMarkerSpaceCreateInfoVARJO. The runtime **must** return `XR_ERROR_MARKER_ID_INVALID_VARJO` if the supplied XrMarkerSpaceCreateInfoVARJO::`markerId` is invalid.

Valid Usage (Implicit)

- The `XR_VARJO_marker_tracking` extension **must** be enabled prior to calling xrCreateMarkerSpaceVARJO
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrMarkerSpaceCreateInfoVARJO structure
- `space` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MARKER_ID_INVALID_VARJO
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

New Structures

The XrSystemMarkerTrackingPropertiesVARJO structure is defined as:

```
// Provided by XR_VARJO_marker_tracking
typedef struct XrSystemMarkerTrackingPropertiesVARJO {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsMarkerTracking;
} XrSystemMarkerTrackingPropertiesVARJO;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- supportsMarkerTracking is an XrBool32, indicating if current system is capable of performing marker tracking.

An application **may** inspect whether the system is capable of marker tracking by chaining an XrSystemMarkerTrackingPropertiesVARJO structure to the XrSystemProperties structure when calling xrGetSystemProperties.

The runtime **should** return XR_TRUE for supportsMarkerTracking when marker tracking is available in the system, otherwise XR_FALSE. Marker tracking calls **must** return XR_ERROR_FEATURE_UNSUPPORTED if marker tracking is not available in the system.

Valid Usage (Implicit)

- The XR_VARJO_marker_tracking extension **must** be enabled prior to using XrSystemMarkerTrackingPropertiesVARJO
- type **must** be XR_TYPE_SYSTEM_MARKER_TRACKING_PROPERTIES_VARJO
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataMarkerTrackingUpdateVARJO structure is defined as:

```
// Provided by XR_VARJO_marker_tracking
typedef struct XrEventDataMarkerTrackingUpdateVARJO {
    XrStructureType    type;
    const void*        next;
    uint64_t           markerId;
    XrBool32           isActive;
    XrBool32           isPredicted;
    XrTime             time;
} XrEventDataMarkerTrackingUpdateVARJO;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- markerId unique identifier of the marker that has been updated.
- isActive the tracking state of the marker.
- isPredicted the prediction state of the marker.
- time the time of the marker update.

Receiving the XrEventDataMarkerTrackingUpdateVARJO event structure indicates that the tracking information has changed. The runtime **must** not send more than one event per frame per marker. The runtime **must** send an event if the marker has changed its state (active or inactive). The runtime **must**

send an event if it has detected pose change of the active marker.

Valid Usage (Implicit)

- The XR_VARJO_marker_tracking extension **must** be enabled prior to using XrEventDataMarkerTrackingUpdateVARJO
- type **must** be XR_TYPE_EVENT_DATA_MARKER_TRACKING_UPDATE_VARJO
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrMarkerSpaceCreateInfoVARJO structure is defined as:

```
// Provided by XR_VARJO_marker_tracking
typedef struct XrMarkerSpaceCreateInfoVARJO {
    XrStructureType    type;
    const void*        next;
    uint64_t           markerId;
    XrPosef            poseInMarkerSpace;
} XrMarkerSpaceCreateInfoVARJO;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- markerId unique identifier of the marker.
- poseInMarkerSpace is an XrPosef defining the position and orientation of the new space's origin relative to the marker's natural origin.

Valid Usage (Implicit)

- The XR_VARJO_marker_tracking extension **must** be enabled prior to using XrMarkerSpaceCreateInfoVARJO
- type **must** be XR_TYPE_MARKER_SPACE_CREATE_INFO_VARJO
- next **must** be NULL or a valid pointer to the next structure in a structure chain

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_MARKER_TRACKING_PROPERTIES_VARJO
- XR_TYPE_EVENT_DATA_MARKER_TRACKING_UPDATE_VARJO
- XR_TYPE_MARKER_SPACE_CREATE_INFO_VARJO

XrResult enumeration is extended with:

- XR_ERROR_MARKER_ID_INVALID_VARJO
- XR_ERROR_MARKER_NOT_TRACKED_VARJO

Issues

Version History

- Revision 1, 2021-09-30 (Roman Golovanov)
  - Initial extension description

12.198.2. Example

The example below represents the routine which enables marker tracking feature and then polls events. The event type XR_TYPE_EVENT_DATA_MARKER_TRACKING_UPDATE_VARJO has a special handler to process marker state change.

```
XrSession session; // previously initialized
if(XR_SUCCESS != xrSetMarkerTrackingVARJO(session, XR_TRUE)) {
    return;
}

XrInstance instance; // previously initialized
XrFrameState frameState; // previously initialized
XrSpace baseSpace; // previously initialized
XrSpaceLocation location; // previously initialized

// Collection of tracked markers and their space handlers
std::unordered_map<uint64_t, XrSpace> markerSpaces;
// Initialize an event buffer to hold the output.
XrEventDataBuffer event {
    .type = XR_TYPE_EVENT_DATA_BUFFER,
};
XrResult result = xrPollEvent(instance, &event);
if (result == XR_SUCCESS) {
    switch (event.type) {
        case XR_TYPE_EVENT_DATA_MARKER_TRACKING_UPDATE_VARJO: {
            const auto& marker_update =
              *reinterpret_cast<XrEventDataMarkerTrackingUpdateVARJO*>(&event);

```

```
            const auto id = marker_update.markerId;

            // If marker appeared for the first time then set some settings and
            // add it to collection
            if(0 == markerSpaces.count(id)) {
                XrMarkerSpaceCreateInfoVARJO spaceInfo {
                    .type = XR_TYPE_MARKER_SPACE_CREATE_INFO_VARJO,
                    .markerId = id,
                    .poseInMarkerSpace = {
                        .orientation = {
                            .w = 1.0f,
                        },
                    },
                };
                XrSpace markerSpace {XR_NULL_HANDLE};
                // Set 1 second timeout
                if(XR_SUCCESS != xrSetMarkerTrackingTimeoutVARJO(
                                    session, id, 1000000000))
                {
                    break;
                }
                // Enable prediction for markers with `odd` ids.
                if(XR_SUCCESS != xrSetMarkerTrackingPredictionVARJO(
                                    session, id, id % 2))
                {
                    break;
                }
                if(XR_SUCCESS != xrCreateMarkerSpaceVARJO(session, &spaceInfo,
                                    &markerSpace)) {
                    break;
                }
                markerSpaces[id] = markerSpace;
            }

            if(marker_update.isActive) {
                if(XR_SUCCESS != xrLocateSpace(markerSpaces.at(id), baseSpace,
                                    frameState.predictedDisplayTime, &location)){
                   break;
                }
                if(marker_update.isPredicted) {

Overview

Varjo headsets use video pass-through cameras to create the mixed reality (MR) image. The cameras are located around 10 cm (3.9 inches) in front of the user's eyes, which leads to an offset in depth perception so that real-world objects in the video pass-through image appear larger than they are in real life. The image below gives a visualization of the difference between what the camera sees and what the user would see in real life.

This magnification effect is pronounced for objects that are close to the user – for example, their hands may appear unnaturally large in the image. The effect decreases with distance, so that objects at a distance of 2 meters already appear close to their actual size, and the sizes eventually converge at infinity. Note that while the objects' sizes may differ, their geometry, relative sizes, locations, etc. remain accurate. The extent of the magnification effect ultimately depends both on the application itself and the user's physiology, as the human visual system is highly adaptive in this type of setting.

When blending the video pass-through image with virtual content, it is important that their relative geometries – position, size, and disparity – match one another. To achieve this, Varjo's runtime automatically places the virtual reality cameras in the same position as the physical cameras when the video pass-through feature is enabled (see `XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND`). This allows virtual and real-world content to appear at the same distance and on the same plane when viewed together. While this can be observed as an apparent jump in the location of virtual objects compared to VR-only content, this does not cause any distortion in the object geometry or location; it is only the viewer's location that changes.

In some cases, moving the VR content to match the real-world position may not be desirable. This extension enable the application to control where the VR content is rendered from the location of the user's eyes while the video pass-through image uses the camera locations. For example, if the virtual object is close the user, or if the application is switching between VR and MR modes. Offset values between 0.0 and 1.0 are supported. You can use this to create a smooth, animated transition between the two rendering positions in case you need to change from one to the other during a session.

New Functions

The xrSetViewOffsetVARJO function is defined as:

```
// Provided by XR_VARJO_view_offset
XrResult xrSetViewOffsetVARJO(
    XrSession                                   session,
    float                                       offset);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `offset` is the view offset to be applied. Must be between 0 and 1.

The xrSetViewOffsetVARJO function takes a float between 0.0 and 1.0. 0.0 means the pose returned by xrLocateViews will be at the eye location, a value of 1.0 means the pose will be at the camera location. A value between 0.0 and 1.0 will interpolate the pose to be in between the eye and the camera location. A value less than 0.0 or more than 1.0 will fail and return error `XR_ERROR_VALIDATION_FAILURE`.

Note that by default the offset is set to 0 if the pass-through cameras are not active, a.k.a. in VR (`XR_ENVIRONMENT_BLEND_MODE_OPAQUE`), and 1 if the cameras are active, a.k.a. in MR (`XR_ENVIRONMENT_BLEND_MODE_ALPHA_BLEND` or `XR_ENVIRONMENT_BLEND_MODE_ADDITIVE`).

Valid Usage (Implicit)

- The `XR_VARJO_view_offset` extension **must** be enabled prior to calling xrSetViewOffsetVARJO
- `session` **must** be a valid XrSession handle

Overview

This extension adds a new interaction profile for the Varjo Controllers compatible with the Varjo XR-4 headset.

Interaction profile path:

- */interaction_profiles/varjo/xr-4_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/varjo/xr-4_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/varjo/xr-4_controller_varjo*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for the user paths:

- */user/hand/left*
- */user/hand/right*

Supported component paths for */user/hand/left* only:

- *.../input/menu/click*

Supported component paths for */user/hand/right* only:

- *.../input/system/click* (**may** not be available for application use)

Supported component paths on both pathnames:

- *.../input/a/click*
- *.../input/a/touch*
- *.../input/b/click*
- *.../input/b/touch*
- *.../input/squeeze/click*
- *.../input/squeeze/touch*
- *.../input/trigger/value*
- *.../input/trigger/touch*
- *.../input/thumbstick/x*
- *.../input/thumbstick/y*
- *.../input/thumbstick/click*
- *.../input/thumbstick/touch*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../output/haptic*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Overview

This extension defines a new interaction profile for the YVR Controller, including but not limited to YVR1 and YVR2 Controller.

YVR Controller interaction profile

Interaction profile path:

- */interaction_profiles/yvr/touch_controller_yvr*

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

This interaction profile represents the input sources and haptics on the YVR Controller.

Supported component paths:

- On */user/hand/left* only:
  - *.../input/x/click*
  - *.../input/x/touch*
  - *.../input/y/click*
  - *.../input/y/touch*
  - *.../input/menu/click*
- On */user/hand/right* only:
  - *.../input/a/click*
  - *.../input/a/touch*
  - *.../input/b/click*
  - *.../input/b/touch*
  - *.../input/system/click* (**may** not be available for application use)

- On both:
  - *.../input/squeeze/click*
  - *.../input/trigger/value*
  - *.../input/trigger/touch*
  - *.../input/thumbstick/x*
  - *.../input/thumbstick/y*

Overview

Application developers may desire to implement an OpenXR application that renders content on top of another OpenXR application. These additional applications will execute in a separate process, create a separate session, generate separate content, but want the OpenXR runtime to composite their content on top of the main OpenXR application. Examples of these applications might include:

- A debug environment outputting additional content
- A Store application that hovers to one side of the user's view
- A interactive HUD designed to expose additional chat features

This extension introduces the concept of "Overlay Sessions" in order to expose this usage model.

This extension allows:

- An application to identify when the current sessions composition layers will be applied during composition
- The ability for an overlay session to get information about what is going on with the main application

To create an overlay session, an application **must** pass an XrSessionCreateInfoOverlayEXTX structure to xrCreateSession via the XrSessionCreateInfo structure's `next` parameter.

An overlay application should not assume that the values returned to it by xrWaitFrame in `predictedDisplayTime` in XrFrameState will be the same as the values returned to the main application or even correlated.

13.1.1. Overlay Session Layer Placement

Since one or more sessions may be active at the same time, this extension provides the ability for the application to identify when the frames of the current session will be composited into the final frame.

The XrSessionCreateInfoOverlayEXTX `sessionLayersPlacement` parameter provides information on when the sessions composition layers should be applied to the final composition frame. The larger the value passed into `sessionLayersPlacement`, the closer to the front this session's composition layers will appear (relative to other overlay session's composition layers). The smaller the value of `sessionLayersPlacement`, the further to the back this session's composition's layers will appear. The main session's composition layers will always be composited first, resulting in any overlay content being composited on top of the main application's content.

If `sessionLayersPlacement` is 0, then the runtime will always attempt to composite that session's composition layers first. If `sessionLayersPlacement` is UINT32_MAX, then the runtime will always attempt to composite that session's composition layers last. If two or more overlay sessions are created with the same `sessionLayersPlacement` value, then the newer session's will be treated as if they had a slightly higher value of `sessionLayersPlacement` than the previous sessions with the same value. This should result in the newest overlay session being composited closer to the user than the older session.

The following image hopefully will provide any further clarification you need:

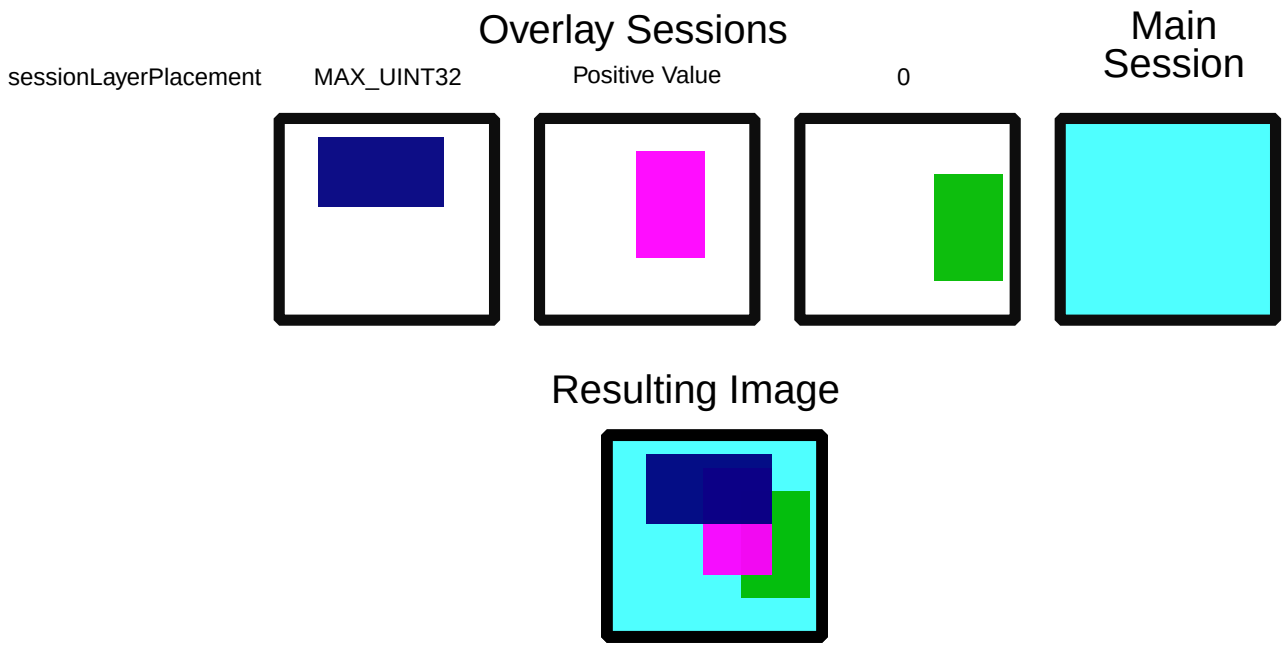

Figure 37. Overlay Composition Order

13.1.2. Main Session Behavior Event

Since an overlay session's intends to work in harmony with a main session, some information needs to be provided from that main session to the overlay session.

The XrEventDataMainSessionVisibilityChangedEXTX event structure provides information on the visibility of the main session as well as some additional flags which can be used to adjust overlay behavior.

If `XR_KHR_composition_layer_depth` is enabled in the main session, then XrEventDataMainSessionVisibilityChangedEXTX `flags` **should** contain the value: `XR_OVERLAY_MAIN_SESSION_ENABLED_COMPOSITION_LAYER_INFO_DEPTH_BIT_EXTX`. If the overlay session also enables `XR_KHR_composition_layer_depth`, then when both sessions are visible, the runtime can integrate their projection layer content together using depth information as described in the extension. However, if either the main session or the overlay do not enable the extension, then composition behavior will continue as if neither one enabled the extension.

13.1.3. Modifications to the OpenXR Specification

When this extension is enabled, certain core behaviors defined in the OpenXR specification must change as defined below:

Modifications to Composition

The Compositing section description of the composition process will be changed if this extension is enabled. If this extension is enabled, and there is only one active session, then there is no change. However, if this extension is enabled, and there are multiple active sessions, then the composition will occur in order based on the overlay session's XrSessionCreateInfoOverlayEXTX::`sessionLayersPlacement` value as described in the table below:

Table 6. Overlay Session Composition Order

Session Type	**XrSessionCreateInfoOverlayEXTX**::`sessionLayersPlacement`	Composited
Overlay Session	UINT32_MAX	*Composited last, appears in front of all other XrSessions*
Overlay Session	<Positive value>	
Overlay Session	0	
Non-overlay Session	N/A	*Composited first, appears behind all other XrSessions*

The above change only applies to when a session's composition layers are applied to the resulting image. The order in which composition layers are handled internal to a session does not change. However, once the sessions have been properly ordered, the runtime should behave as if all the composition layers have been placed into a single list (maintaining the separation of viewport images) and treat them as if they were from one original session. From this point forward, the composition behavior of the resulting composition layers is the same whether or not this extension is enabled.

If the overlay session is created as part of an XrInstance which has enabled the `XR_KHR_composition_layer_depth` extension, and a XrCompositionLayerDepthInfoKHR structure has been provided to one or more composition layers, then it intends for those layers to be composited into the final image using that depth information. This composition occurs as defined in the `XR_KHR_composition_layer_depth` extension. However, this is only possible if the main session has provided depth buffer information as part of its swapchain. In the event that a main session does not provide depth buffer information as part of its swapchain, then overlay application's composition layers containing depth information will be composited as if they did not contain that information.

Modifications to xrEndFrame Behavior

Frame Submission currently states that if xrEndFrame is called with no layers, then the runtime should clear the VR display.

If this extension is enabled, the above statement is now only true if the session is not an overlay session. If the session is an overlay session, and it provides 0 layers in the call to xrEndFrame, then the runtime will just ignore the overlay session for the current frame.

Modifications to Input Synchronization

If a runtime supports this extension, it **must** separate input tracking on a per-session basis. This means that reading the input from one active session does not disturb the input information that can be read by another active session. This may require duplicating events to more than one session.

New Object Types

None

New Flag Types

```
// Provided by XR_EXTX_overlay
typedef XrFlags64 XrOverlayMainSessionFlagsEXTX;
```

```
// Provided by XR_EXTX_overlay
// Flag bits for XrOverlayMainSessionFlagsEXTX
static const XrOverlayMainSessionFlagsEXTX
XR_OVERLAY_MAIN_SESSION_ENABLED_COMPOSITION_LAYER_INFO_DEPTH_BIT_EXTX = 0x00000001;
```

```
// Provided by XR_EXTX_overlay
typedef XrFlags64 XrOverlaySessionCreateFlagsEXTX;
```

```
// Provided by XR_EXTX_overlay
// Flag bits for XrOverlaySessionCreateFlagsEXTX
```

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SESSION_CREATE_INFO_OVERLAY_EXTX
- XR_TYPE_EVENT_DATA_MAIN_SESSION_VISIBILITY_CHANGED_EXTX

New Enums

- XR_OVERLAY_MAIN_SESSION_ENABLED_COMPOSITION_LAYER_INFO_DEPTH_BIT_EXTX

New Structures

```
// Provided by XR_EXTX_overlay
typedef struct XrSessionCreateInfoOverlayEXTX {
    XrStructureType                    type;
    const void*                        next;
    XrOverlaySessionCreateFlagsEXTX    createFlags;
    uint32_t                           sessionLayersPlacement;
} XrSessionCreateInfoOverlayEXTX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `createFlags` is `0` or one or more XrOverlaySessionCreateFlagBitsEXTX which indicate various characteristics desired for the overlay session.
- `sessionLayersPlacement` is a value indicating the desired placement of the session's composition layers in terms of other sessions.

Valid Usage (Implicit)

- The `XR_EXTX_overlay` extension **must** be enabled prior to using XrSessionCreateInfoOverlayEXTX
- `type` **must** be `XR_TYPE_SESSION_CREATE_INFO_OVERLAY_EXTX`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `createFlags` **must** be `0`

The XrEventDataMainSessionVisibilityChangedEXTX structure is defined as:

```
// Provided by XR_EXTX_overlay
typedef struct XrEventDataMainSessionVisibilityChangedEXTX {
    XrStructureType                  type;
    const void*                      next;
    XrBool32                         visible;
    XrOverlayMainSessionFlagsEXTX    flags;
} XrEventDataMainSessionVisibilityChangedEXTX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `visible` is an `XrBool32` which indicates if the main session is now visible or is not.
- `flags` is 0 or one or more XrOverlayMainSessionFlagBitsEXTX which indicates various state information for the main session.

Receiving the XrEventDataMainSessionVisibilityChangedEXTX event structure indicates that the main session has gained or lost visibility. This can occur in many cases, one typical example is when a user switches from one OpenXR application to another. See XrEventDataMainSessionVisibilityChangedEXTX for more information on the standard behavior. This structure contains additional information on the main session including `flags` which indicate additional state information of the main session. Currently, the only flag value supplied is `XR_OVERLAY_MAIN_SESSION_ENABLED_COMPOSITION_LAYER_INFO_DEPTH_BIT_EXTX` which indicates if the main session has enabled the `XR_KHR_composition_layer_depth` extension.

Valid Usage (Implicit)

- The `XR_EXTX_overlay` extension **must** be enabled prior to using XrEventDataMainSessionVisibilityChangedEXTX
- `type` **must** be `XR_TYPE_EVENT_DATA_MAIN_SESSION_VISIBILITY_CHANGED_EXTX`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

This extension defines a new interaction profile for HTC VIVE Tracker. HTC VIVE Tracker is a generic tracked device which can be attached to anything to make them trackable. For example, it can be attached to user's hands or feet to track the motion of human body. It can also be attached to any other devices the user wants to track and interact with.

This extension allows:

- An application to enumerate the subpaths of all current connected VIVE trackers.
- An application to receive notification of the top level paths of a VIVE tracker when it is connected.

The paths of a VIVE tracker contains two paths below:

- VIVE tracker persistent path indicate a specific tracker whose lifetime lasts longer than an instance, which means it **must** not change during its hardware lifetime. The format of this path string is unspecified and should be treated as an opaque string.
- VIVE tracker role path **may** be constructed as "/user/vive_tracker_htcx/role/*ROLE_VALUE*", where *ROLE_VALUE* takes one of the following values. The role path **may** be assigned from the tool provided by the runtime and is XR_NULL_PATH if it has not been assigned. If this role path refers to more than one tracker, the runtime **should** choose one of them to be currently active. The role path **may** be changed during the lifetime of instance. Whenever it is changed, the runtime **must** send event `XR_TYPE_EVENT_DATA_VIVE_TRACKER_CONNECTED_HTCX` to provide the new role path of that tracker.

  ROLE_VALUE
  - `XR_NULL_PATH`
  - `handheld_object`
  - `left_foot`
  - `right_foot`
  - `left_shoulder`
  - `right_shoulder`
  - `left_elbow`
  - `right_elbow`
  - `left_knee`
  - `right_knee`
  - `left_wrist` (rev: 3)
  - `right_wrist` (rev: 3)
  - `left_ankle` (rev: 3)
  - `right_ankle` (rev: 3)
  - `waist`

    - `chest`
    - `camera`
    - `keyboard`

- Either the persistent path or the role path can be be passed as a subaction path to indicate a specific tracker. For example, XrActionCreateInfo::`subactionPaths` into function xrCreateAction or XrActionSpaceCreateInfo::`subactionPath` into function xrCreateActionSpace. Please see Example 1 below.

As with other controllers, if a VIVE tracker is connected and bound to a top-level user path, or disconnected while bound to top-level user path, the runtime **must** send event `XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED`, and the application **may** call xrGetCurrentInteractionProfile to check if the tracker is active or not.

The device that a tracker is attached to probably has a different motion model than what the tracker assumes. The motion tracking might not be as expected in this case.

VIVE Tracker interaction profile

Interaction profile path:

- */interaction_profiles/htc/vive_tracker_htcx*

This interaction profile represents the input sources and haptics on the VIVE Tracker.

Supported component paths:

- *.../input/system/click* (**may** not be available for application use)
- *.../input/menu/click*
- *.../input/trigger/click*
- *.../input/squeeze/click*
- *.../input/trigger/value*
- *.../input/trackpad/x*

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_VIVE_TRACKER_PATHS_HTCX
- XR_TYPE_EVENT_DATA_VIVE_TRACKER_CONNECTED_HTCX

New Enums

New Structures

The XrViveTrackerPathsHTCX structure is defined as:

```
// Provided by XR_HTCX_vive_tracker_interaction
typedef struct XrViveTrackerPathsHTCX {
    XrStructureType    type;
    void*              next;
    XrPath             persistentPath;
    XrPath             rolePath;
} XrViveTrackerPathsHTCX;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- persistentPath is the unique path of the VIVE tracker which is persistent over the lifetime of the hardware.
- rolePath is the path of the VIVE tracker role. This **may** be XR_NULL_PATH if the role is not assigned.

The XrViveTrackerPathsHTCX structure contains two paths of VIVE tracker.

Valid Usage (Implicit)

- The XR_HTCX_vive_tracker_interaction extension **must** be enabled prior to using XrViveTrackerPathsHTCX
- type **must** be XR_TYPE_VIVE_TRACKER_PATHS_HTCX
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The XrEventDataViveTrackerConnectedHTCX structure is defined as:

```
// Provided by XR_HTCX_vive_tracker_interaction
typedef struct XrEventDataViveTrackerConnectedHTCX {
    XrStructureType            type;
    const void*                next;
    XrViveTrackerPathsHTCX*    paths;
} XrEventDataViveTrackerConnectedHTCX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `paths` contains two paths of the connected VIVE tracker.

Receiving the XrEventDataViveTrackerConnectedHTCX event structure indicates that a new VIVE tracker was connected or its role changed. It is received via xrPollEvent.

Valid Usage (Implicit)

- The `XR_HTCX_vive_tracker_interaction` extension **must** be enabled prior to using XrEventDataViveTrackerConnectedHTCX
- `type` **must** be `XR_TYPE_EVENT_DATA_VIVE_TRACKER_CONNECTED_HTCX`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Functions

The xrEnumerateViveTrackerPathsHTCX function is defined as:

```
// Provided by XR_HTCX_vive_tracker_interaction
XrResult xrEnumerateViveTrackerPathsHTCX(
    XrInstance                                  instance,
    uint32_t                                    pathCapacityInput,
    uint32_t*                                   pathCountOutput,
    XrViveTrackerPathsHTCX*                     paths);
```

Parameter Descriptions

- `instance` is an instance previously created.
- `pathCapacityInput` is the capacity of the `paths`, or `0` to retrieve the required capacity.
- `pathCountOutput` is a pointer to the count of XrViveTrackerPathsHTCX `paths` written, or a pointer to the required capacity in the case that `pathCapacityInput` is insufficient.
- `paths` is a pointer to an array of XrViveTrackerPathsHTCX VIVE tracker paths, but **can** be `NULL` if `pathCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `paths` size.

xrEnumerateViveTrackerPathsHTCX enumerates all connected VIVE trackers to retrieve their paths under current instance.

Valid Usage (Implicit)

- The `XR_HTCX_vive_tracker_interaction` extension **must** be enabled prior to calling xrEnumerateViveTrackerPathsHTCX
- `instance` **must** be a valid XrInstance handle
- `pathCountOutput` **must** be a pointer to a `uint32_t` value
- If `pathCapacityInput` is not `0`, `paths` **must** be a pointer to an array of `pathCapacityInput` XrViveTrackerPathsHTCX structures

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

Examples

Example 1

This example illustrates how to locate a VIVE tracker which is attached on the chest. First of all, create an action with */user/vive_tracker_htcx/role/chest* as the subaction path. Then, submit a suggested binding for that action to the role path plus *.../input/grip/pose*, for the interaction profile */interaction_profiles/htc/vive_tracker_htcx*, using xrSuggestInteractionProfileBindings. To locate the tracker, create an action space from that action, with */user/vive_tracker_htcx/role/chest* once again specified as the subaction path.

```
extern XrInstance instance;  // previously initialized
extern XrSession session;  // previously initialized
extern XrActionSet actionSet;  // previously initialized

// Create the action with subaction path
XrPath chestTrackerRolePath {XR_NULL_PATH};
CHK_XR(xrStringToPath(instance, "/user/vive_tracker_htcx/role/chest",
    &chestTrackerRolePath));

XrAction chestPoseAction {XR_NULL_HANDLE};
XrActionCreateInfo actionInfo {
    .type = XR_TYPE_ACTION_CREATE_INFO,
    .actionType = XR_ACTION_TYPE_POSE_INPUT,
    .countSubactionPaths = 1,
    .subactionPaths = &chestTrackerRolePath,
};
CHK_XR(xrCreateAction(actionSet, &actionInfo, &chestPoseAction));

// Describe a suggested binding for that action and subaction path.
XrPath suggestedBindingPath {XR_NULL_PATH};
CHK_XR(xrStringToPath(instance,
    "/user/vive_tracker_htcx/role/chest/input/grip/pose",
    &suggestedBindingPath));

std::vector<XrActionSuggestedBinding> actionSuggBindings;
XrActionSuggestedBinding actionSuggBinding {
    .action = chestPoseAction,
    .binding = suggestedBindingPath,
};
actionSuggBindings.push_back(actionSuggBinding);

// Suggest that binding for the VIVE tracker interaction profile
XrPath viveTrackerInteractionProfilePath {XR_NULL_PATH};
CHK_XR(xrStringToPath(instance, "/interaction_profiles/htc/vive_tracker_htcx",
    &viveTrackerInteractionProfilePath));

XrInteractionProfileSuggestedBinding profileSuggBindings {
    .type = XR_TYPE_INTERACTION_PROFILE_SUGGESTED_BINDING,
```

```
    .interactionProfile = viveTrackerInteractionProfilePath,
    .countSuggestedBindings = static_cast<uint32_t>(actionSuggBindings.size()),
    .suggestedBindings = actionSuggBindings.data(),
};
CHK_XR(xrSuggestInteractionProfileBindings(instance, &profileSuggBindings));

// Create action space for locating tracker
XrSpace chestTrackerSpace {XR_NULL_HANDLE};
XrActionSpaceCreateInfo actionSpaceInfo {
    .type = XR_TYPE_ACTION_SPACE_CREATE_INFO,
    .action = chestPoseAction,
    .subactionPath = chestTrackerRolePath,
};
CHK_XR(xrCreateActionSpace(session, &actionSpaceInfo, &chestTrackerSpace));
```

Example 2

This example illustrates how to handle the VIVE tracker when it is connected or disconnected. When a VIVE tracker is connected or its role changed, event `XR_TYPE_EVENT_DATA_VIVE_TRACKER_CONNECTED_HTCX` will be received. The role path and persistent path of this tracker can be retrieved with this event. When a VIVE tracker is connected or disconnected, event `XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED` will also be received. The XrInteractionProfileState ::`interactionProfile` will be XR_NULL_PATH if the tracker represented by that top level path is not connected.

```
extern XrInstance instance;  // previously initialized
extern XrSession session;  // previously initialized
extern XrEventDataBuffer xrEvent; // previously received from xrPollEvent

switch ( xrEvent.type )
{
    case XR_TYPE_EVENT_DATA_VIVE_TRACKER_CONNECTED_HTCX: {
        const XrEventDataViveTrackerConnectedHTCX& viveTrackerConnected =
            *reinterpret_cast<XrEventDataViveTrackerConnectedHTCX*>(&xrEvent);
        uint32_t nCount;
        char sPersistentPath[XR_MAX_PATH_LENGTH];
        CHK_XR(xrPathToString(instance,
            viveTrackerConnected.paths->persistentPath,
            sizeof(sPersistentPath), &nCount, sPersistentPath));

        std::printf("Vive Tracker connected: %s \n", sPersistentPath);
        if (viveTrackerConnected.paths->rolePath != XR_NULL_PATH) {
            char sRolePath[XR_MAX_PATH_LENGTH];
            CHK_XR(xrPathToString(instance,
                viveTrackerConnected.paths->rolePath, sizeof(sRolePath),
                &nCount, sRolePath));

            std::printf(" New role is: %s\n\n", sRolePath);
        } else {
            std::printf(" No role path.\n\n");
        }
        break;
    }

    case XR_TYPE_EVENT_DATA_INTERACTION_PROFILE_CHANGED: {
        XrPath chestTrackerRolePath {XR_NULL_PATH};
        XrInteractionProfileState xrInteractionProfileState {
            .type = XR_TYPE_INTERACTION_PROFILE_STATE,
        };

        CHK_XR(xrStringToPath(instance, "/user/vive_tracker_htcx/role/chest",
            &chestTrackerRolePath));
        CHK_XR(xrGetCurrentInteractionProfile(session, chestTrackerRolePath,
            &xrInteractionProfileState));
        break;
    }
}
```

Issues

Version History

- Revision 1, 2021-09-23 (Kyle Chen)
  - Initial extension description.
- Revision 2, 2022-09-08 (Rylie Pavlik, Collabora, Ltd.)
  - Mark event type as returned-only, updating the implicit valid usage.
- Revision 3, 2022-05-19 (Rune Berg, Valve Corporation)
  - Add new wrist and ankle roles to match additional openvr roles.

Overview

This extension must be provided by runtimes supporting applications using the EGL API to create rendering contexts.

- XR_USE_PLATFORM_EGL

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_GRAPHICS_BINDING_EGL_MNDX

New Enums

New Structures

The XrGraphicsBindingEGLMNDX structure is defined as:

```
// Provided by XR_MNDX_egl_enable
typedef struct XrGraphicsBindingEGLMNDX {
    XrStructureType                 type;
    const void*                     next;
    PFN_xrEglGetProcAddressMNDX     getProcAddress;
    EGLDisplay                      display;
    EGLConfig                       config;
    EGLContext                      context;
} XrGraphicsBindingEGLMNDX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `getProcAddress` is a valid function pointer to `eglGetProcAddress`.
- `display` is a valid EGL `EGLDisplay`.
- `config` is a valid EGL `EGLConfig`.
- `context` is a valid EGL `EGLContext`.

When creating an EGL based XrSession, the application will provide a pointer to an XrGraphicsBindingEGLMNDX structure in the `next` chain of the XrSessionCreateInfo.

The required window system configuration define to expose this structure type is XR_USE_PLATFORM_EGL.

Valid Usage (Implicit)

- The XR_MNDX_egl_enable extension **must** be enabled prior to using XrGraphicsBindingEGLMNDX
- type **must** be XR_TYPE_GRAPHICS_BINDING_EGL_MNDX
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- getProcAddress **must** be a valid PFN_xrEglGetProcAddressMNDX value
- display **must** be a valid EGLDisplay value
- config **must** be a valid EGLConfig value
- context **must** be a valid EGLContext value

New Functions

New Function Pointers

```
// Provided by XR_MNDX_egl_enable
typedef PFN_xrVoidFunction (*PFN_xrEglGetProcAddressMNDX)(const char *name);
```

Parameter Descriptions

- name specifies the name of the function to return.

eglGetProcAddress returns the address of the client API or EGL function named by procname. For details please see https://registry.khronos.org/EGL/sdk/docs/man/html/eglGetProcAddress.xhtml

Issues

Version History

- Revision 1, 2020-05-20 (Jakob Bornecrantz)
  - Initial draft
- Revision 2, 2023-12-02
  - Use PFN_xrEglGetProcAddressMNDX to replace PFNEGLGETPROCADDRESSPROC (for eglGetProcAddress). Note this does change function pointer attributes on some platforms.

Overview

This extension provides APIs for force feedback devices capable of restricting physical movement in a single direction along a single dimension.

The intended use for this extension is to provide simple force feedback capabilities to restrict finger movement for VR Gloves.

The application **must** also enable the `XR_EXT_hand_tracking` extension in order to use this extension.

The XrForceFeedbackCurlLocationMNDX describes which location to apply force feedback.

```
// Provided by XR_MNDX_force_feedback_curl
typedef enum XrForceFeedbackCurlLocationMNDX {
    XR_FORCE_FEEDBACK_CURL_LOCATION_THUMB_CURL_MNDX = 0,
    XR_FORCE_FEEDBACK_CURL_LOCATION_INDEX_CURL_MNDX = 1,
    XR_FORCE_FEEDBACK_CURL_LOCATION_MIDDLE_CURL_MNDX = 2,
    XR_FORCE_FEEDBACK_CURL_LOCATION_RING_CURL_MNDX = 3,
    XR_FORCE_FEEDBACK_CURL_LOCATION_LITTLE_CURL_MNDX = 4,
    XR_FORCE_FEEDBACK_CURL_LOCATION_MAX_ENUM_MNDX = 0x7FFFFFFF
} XrForceFeedbackCurlLocationMNDX;
```

Enumerant Descriptions

- XR_FORCE_FEEDBACK_CURL_LOCATION_THUMB_CURL_MNDX — force feedback for thumb curl
- XR_FORCE_FEEDBACK_CURL_LOCATION_INDEX_CURL_MNDX — force feedback for index finger curl
- XR_FORCE_FEEDBACK_CURL_LOCATION_MIDDLE_CURL_MNDX — force feedback for middle finger curl
- XR_FORCE_FEEDBACK_CURL_LOCATION_RING_CURL_MNDX — force feedback for ring finger curl
- XR_FORCE_FEEDBACK_CURL_LOCATION_LITTLE_CURL_MNDX — force feedback for little finger curl

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_SYSTEM_FORCE_FEEDBACK_CURL_PROPERTIES_MNDX
- XR_TYPE_FORCE_FEEDBACK_CURL_APPLY_LOCATIONS_MNDX

New Enums

- XrForceFeedbackCurlLocationMNDX

New Structures

The XrSystemForceFeedbackCurlPropertiesMNDX structure is defined as:

```
// Provided by XR_MNDX_force_feedback_curl
typedef struct XrSystemForceFeedbackCurlPropertiesMNDX {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsForceFeedbackCurl;
} XrSystemForceFeedbackCurlPropertiesMNDX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `supportsForceFeedbackCurl` is an `XrBool32`, indicating if the current system is capable of performing force feedback.

An application **may** inspect whether the system is capable of force feedback by chaining an XrSystemForceFeedbackCurlPropertiesMNDX structure to the XrSystemProperties structure when calling xrGetSystemProperties.

The runtime **should** return `XR_TRUE` for `supportsForceFeedbackCurl` when force feedback is available in the system, otherwise `XR_FALSE`. Force feedback calls **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if force feedback is not available in the system.

Valid Usage (Implicit)

- The `XR_MNDX_force_feedback_curl` extension **must** be enabled prior to using XrSystemForceFeedbackCurlPropertiesMNDX
- `type` **must** be `XR_TYPE_SYSTEM_FORCE_FEEDBACK_CURL_PROPERTIES_MNDX`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrForceFeedbackCurlApplyLocationsMNDX structure is defined as:

```
// Provided by XR_MNDX_force_feedback_curl
typedef struct XrForceFeedbackCurlApplyLocationsMNDX {
    XrStructureType                         type;
    const void*                             next;
    uint32_t                                locationCount;
    XrForceFeedbackCurlApplyLocationMNDX*   locations;
} XrForceFeedbackCurlApplyLocationsMNDX;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `locationCount` is the number of elements in the `locations` array.
- `locations` is a pointer to an array of locations to apply force feedback.

Contains an array of XrForceFeedbackCurlApplyLocationMNDX that contains information on locations to apply force feedback to.

Valid Usage (Implicit)

- The `XR_MNDX_force_feedback_curl` extension **must** be enabled prior to using XrForceFeedbackCurlApplyLocationsMNDX
- `type` **must** be `XR_TYPE_FORCE_FEEDBACK_CURL_APPLY_LOCATIONS_MNDX`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `locations` **must** be a pointer to an array of `locationCount` XrForceFeedbackCurlApplyLocationMNDX structures
- The `locationCount` parameter **must** be greater than `0`

The XrForceFeedbackCurlApplyLocationMNDX structure is defined as:

```
// Provided by XR_MNDX_force_feedback_curl
typedef struct XrForceFeedbackCurlApplyLocationMNDX {
    XrForceFeedbackCurlLocationMNDX    location;
    float                              value;
} XrForceFeedbackCurlApplyLocationMNDX;
```

Member Descriptions

- `location` represents the location to apply force feedback to.
- `value` is a value from 0-1 representing the amount of force feedback to apply. The range of the value should represent the entire range the location is capable of moving through, with 1 representing making the location incapable of movement, and 0 being fully flexible. For example, in the case of a finger curl, setting `value` to 1 would prevent the finger from curling at all (fully extended), and 0 would allow the finger to have free range of movement, being able to curl fully.

`value` is specified as a limit in a single direction. For example, if the value specified is 0.5, a location **must** have free movement from the point where it would be incapable of movement if `value` was 1, to 0.5 of the range the location is capable of moving.

Valid Usage (Implicit)

- The `XR_MNDX_force_feedback_curl` extension **must** be enabled prior to using XrForceFeedbackCurlApplyLocationMNDX
- `location` **must** be a valid XrForceFeedbackCurlLocationMNDX value

New Functions

The xrApplyForceFeedbackCurlMNDX function is defined as:

```
// Provided by XR_MNDX_force_feedback_curl
XrResult xrApplyForceFeedbackCurlMNDX(
    XrHandTrackerEXT                            handTracker,
    const XrForceFeedbackCurlApplyLocationsMNDX* locations);
```

Parameter Descriptions

- `handTracker` is an XrHandTrackerEXT handle previously created with xrCreateHandTrackerEXT.
- `locations` is an XrForceFeedbackCurlApplyLocationsMNDX containing a set of locations to apply force feedback to.

The xrApplyForceFeedbackCurlMNDX function applies force feedback to the set locations listed in XrForceFeedbackCurlApplyLocationsMNDX.

xrApplyForceFeedbackCurlMNDX **should** be called every time an application wishes to update a set of

force feedback locations.

Submits a request for force feedback for a set of locations. The runtime **should** deliver this request to the `handTracker` device. If the `handTracker` device is not available, the runtime **may** ignore this request for force feedback.

If the session associated with `handTracker` is not focused, the runtime **must** return `XR_SESSION_NOT_FOCUSED`, and not apply force feedback.

When an application submits force feedback for a set of locations, the runtime **must** update the set of locations to that specified by the application. A runtime **must** set any locations not specified by the application when submitting force feedback to 0.

The runtime **may** discontinue force feedback if the application that set it loses focus. An application **should** call the function again after regaining focus if force feedback is still desired.

Valid Usage (Implicit)

- The `XR_MNDX_force_feedback_curl` extension **must** be enabled prior to calling xrApplyForceFeedbackCurlMNDX
- `handTracker` **must** be a valid XrHandTrackerEXT handle
- `locations` **must** be a pointer to a valid XrForceFeedbackCurlApplyLocationsMNDX structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`
- `XR_SESSION_NOT_FOCUSED`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

14.1.1. Overview

This extension introduces the xrLocateSpacesKHR function, which enables applications to locate an array of spaces in a single function call. Runtimes **may** provide performance benefits for applications that use many spaces.

Compared to the xrLocateSpace function, the new xrLocateSpacesKHR function also provides extensible input parameters for future extensions to extend using additional chained structures.

14.1.2. Locate spaces

Applications **can** use xrLocateSpacesKHR function to locate an array of spaces.

The xrLocateSpacesKHR function is defined as:

```
// Provided by XR_KHR_locate_spaces
XrResult xrLocateSpacesKHR(
    XrSession                                   session,
    const XrSpacesLocateInfo*                   locateInfo,
    XrSpaceLocations*                           spaceLocations);
```

Parameter Descriptions

- `session` is an XrSession handle previously created with xrCreateSession.
- `locateInfo` is a pointer to an XrSpacesLocateInfoKHR that provides the input information to locate spaces.
- `spaceLocations` is a pointer to an XrSpaceLocationsKHR for the runtime to return the locations of the specified spaces in the base space.

xrLocateSpacesKHR provides the physical location of one or more spaces in a base space at a specified time, if currently known by the runtime.

The XrSpacesLocateInfoKHR::`time`, the XrSpacesLocateInfoKHR::`baseSpace`, and each space in XrSpacesLocateInfoKHR::`spaces`, in the `locateInfo` parameter, all follow the same specifics as the corresponding inputs to the xrLocateSpace function.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to calling xrLocateSpacesKHR
- `session` **must** be a valid XrSession handle
- `locateInfo` **must** be a pointer to a valid XrSpacesLocateInfo structure
- `spaceLocations` **must** be a pointer to an XrSpaceLocations structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrSpacesLocateInfoKHR structure is defined as:

```
// Provided by XR_KHR_locate_spaces
// XrSpacesLocateInfoKHR is an alias for XrSpacesLocateInfo
typedef struct XrSpacesLocateInfo {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
    uint32_t           spaceCount;
    const XrSpace*     spaces;
} XrSpacesLocateInfo;

typedef XrSpacesLocateInfo XrSpacesLocateInfoKHR;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` identifies the underlying space in which to locate `spaces`.
- `time` is the time for which the location is requested.
- `spaceCount` is a `uint32_t` specifying the count of elements in the `spaces` array.
- `spaces` is an array of valid XrSpace handles to be located.

The `time`, the `baseSpace`, and each space in `spaces` all follow the same specifics as the corresponding inputs to the xrLocateSpace function.

The `baseSpace` and all of the XrSpace handles in the `spaces` array **must** be valid and share the same parent XrSession.

If the `time` is invalid, the xrLocateSpacesKHR **must** return `XR_ERROR_TIME_INVALID`.

The `spaceCount` **must** be a positive number, i.e. the array `spaces` **must** not be empty. Otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to using XrSpacesLocateInfoKHR
- **Note:** XrSpacesLocateInfoKHR is an alias for XrSpacesLocateInfo, so the following items replicate the implicit valid usage for XrSpacesLocateInfo
- `type` **must** be `XR_TYPE_SPACES_LOCATE_INFO`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle
- `spaces` **must** be a pointer to an array of `spaceCount` valid XrSpace handles
- The `spaceCount` parameter **must** be greater than `0`
- Both of `baseSpace` and the elements of `spaces` **must** have been created, allocated, or retrieved from the same XrSession

The XrSpaceLocationsKHR structure is defined as:

```
// Provided by XR_KHR_locate_spaces
// XrSpaceLocationsKHR is an alias for XrSpaceLocations
typedef struct XrSpaceLocations {
    XrStructureType         type;
    void*                   next;
    uint32_t                locationCount;
    XrSpaceLocationData*    locations;
} XrSpaceLocations;

typedef XrSpaceLocations XrSpaceLocationsKHR;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain, such as XrSpaceVelocitiesKHR.
- `locationCount` is a `uint32_t` specifying the count of elements in the `locations` array.
- `locations` is an array of XrSpaceLocationsKHR for the runtime to populate with the locations of the specified spaces in the XrSpacesLocateInfoKHR::`baseSpace` at the specified XrSpacesLocateInfoKHR::`time`.

The XrSpaceLocationsKHR structure contains an array of space locations in the member `locations`, to be used as output for xrLocateSpacesKHR. The application **must** allocate this array to be populated with the function output. The `locationCount` value **must** be the same as XrSpacesLocateInfoKHR::`spaceCount`, otherwise, the xrLocateSpacesKHR function **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to using XrSpaceLocationsKHR
- **Note:** XrSpaceLocationsKHR is an alias for XrSpaceLocations, so the following items replicate the implicit valid usage for XrSpaceLocations
- `type` **must** be `XR_TYPE_SPACE_LOCATIONS`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSpaceVelocities
- `locations` **must** be a pointer to an array of `locationCount` XrSpaceLocationData structures
- The `locationCount` parameter **must** be greater than `0`

The XrSpaceLocationDataKHR structure is defined as:

```
// Provided by XR_KHR_locate_spaces
// XrSpaceLocationDataKHR is an alias for XrSpaceLocationData
typedef struct XrSpaceLocationData {
    XrSpaceLocationFlags    locationFlags;
    XrPosef                 pose;
} XrSpaceLocationData;

typedef XrSpaceLocationData XrSpaceLocationDataKHR;
```

Member Descriptions

- `locationFlags` is a bitfield, with bit masks defined in XrSpaceLocationFlagBits. It behaves the same as XrSpaceLocation::`locationFlags`.
- `pose` is an XrPosef that behaves the same as XrSpaceLocation::`pose`.

This is a single element of the array in XrSpaceLocationsKHR::`locations`, and is used to return the pose and location flags for a single space with respect to the specified base space from a call to xrLocateSpacesKHR. It does not accept chained structures to allow for easier use in dynamically allocated container datatypes. Chained structures are possible with the XrSpaceLocationsKHR that describes an array of these elements.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to using XrSpaceLocationDataKHR

14.1.3. Locate space velocities

Applications **can** request the velocities of spaces by chaining the XrSpaceVelocitiesKHR structure to the next pointer of XrSpaceLocationsKHR when calling xrLocateSpacesKHR.

The XrSpaceVelocitiesKHR structure is defined as:

```
// Provided by XR_KHR_locate_spaces
// XrSpaceVelocitiesKHR is an alias for XrSpaceVelocities
typedef struct XrSpaceVelocities {
    XrStructureType         type;
    void*                   next;
    uint32_t                velocityCount;
    XrSpaceVelocityData*    velocities;
} XrSpaceVelocities;

typedef XrSpaceVelocities XrSpaceVelocitiesKHR;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `velocityCount` is a `uint32_t` specifying the count of elements in the `velocities` array.
- `velocities` is an array of XrSpaceVelocityDataKHR for the runtime to populate with the velocities of the specified spaces in the XrSpacesLocateInfoKHR::`baseSpace` at the specified XrSpacesLocateInfoKHR::`time`.

The `velocities` member contains an array of space velocities in the member `velocities`, to be used as output for xrLocateSpacesKHR. The application **must** allocate this array to be populated with the function output. The `velocityCount` value **must** be the same as XrSpacesLocateInfoKHR::`spaceCount`, otherwise, the xrLocateSpacesKHR function **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to using XrSpaceVelocitiesKHR
- **Note:** XrSpaceVelocitiesKHR is an alias for XrSpaceVelocities, so the following items replicate the implicit valid usage for XrSpaceVelocities
- `type` **must** be `XR_TYPE_SPACE_VELOCITIES`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `velocities` **must** be a pointer to an array of `velocityCount` XrSpaceVelocityData structures
- The `velocityCount` parameter **must** be greater than `0`

The XrSpaceVelocityDataKHR structure is defined as:

```
// Provided by XR_KHR_locate_spaces
// XrSpaceVelocityDataKHR is an alias for XrSpaceVelocityData
typedef struct XrSpaceVelocityData {
    XrSpaceVelocityFlags    velocityFlags;
    XrVector3f              linearVelocity;
    XrVector3f              angularVelocity;
} XrSpaceVelocityData;

typedef XrSpaceVelocityData XrSpaceVelocityDataKHR;
```

Member Descriptions

- `velocityFlags` is a bitfield, with bit values defined in XrSpaceVelocityFlagBits. It behaves the same as XrSpaceVelocity::`velocityFlags`.
- `linearVelocity` is an XrVector3f. It behaves the same as XrSpaceVelocity::`linearVelocity`.
- `angularVelocity` is an XrVector3f. It behaves the same as XrSpaceVelocity::`angularVelocity`.

This is a single element of the array in XrSpaceVelocitiesKHR::`velocities`, and is used to return the linear and angular velocity and velocity flags for a single space with respect to the specified base space from a call to xrLocateSpacesKHR. It does not accept chained structures to allow for easier use in dynamically allocated container datatypes.

Valid Usage (Implicit)

- The `XR_KHR_locate_spaces` extension **must** be enabled prior to using XrSpaceVelocityDataKHR

14.1.4. Example code for xrLocateSpacesKHR

The following example code shows how an application retrieves both the location and velocity of one or more spaces in a base space at a given time using the xrLocateSpacesKHR function.

```
XrInstance instance; // previously initialized
XrSession session; // previously initialized
XrSpace baseSpace; // previously initialized
std::vector<XrSpace> spacesToLocate;  // previously initialized

// Prepare output buffers to receive data and get reused in frame loop.
std::vector<XrSpaceLocationDataKHR> locationBuffer(spacesToLocate.size());
std::vector<XrSpaceVelocityDataKHR> velocityBuffer(spacesToLocate.size());

// Get function pointer for xrLocateSpacesKHR.
```

```
PFN_xrLocateSpacesKHR xrLocateSpacesKHR;
CHK_XR(xrGetInstanceProcAddr(instance, "xrLocateSpacesKHR",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &xrLocateSpacesKHR)));

// application frame loop
while (1) {
    // Typically the time is the predicted display time returned from xrWaitFrame.
    XrTime displayTime; // previously initialized.

    XrSpacesLocateInfoKHR locateInfo {
        .type = XR_TYPE_SPACES_LOCATE_INFO_KHR,
        .baseSpace = baseSpace,
        .time = displayTime,
        .spaceCount = static_cast<uint32_t>(spacesToLocate.size()),
        .spaces = spacesToLocate.data(),
    };

    XrSpaceVelocitiesKHR velocities {
        .type = XR_TYPE_SPACE_VELOCITIES_KHR,
        .velocityCount = static_cast<uint32_t>(velocityBuffer.size()),
        .velocities = velocityBuffer.data(),
    };

    XrSpaceLocationsKHR locations {
        .type = XR_TYPE_SPACE_LOCATIONS_KHR,
        .next = &velocities,
        .locationCount = static_cast<uint32_t>(locationBuffer.size()),
        .locations = locationBuffer.data(),
    };

    CHK_XR(xrLocateSpacesKHR(session, &locateInfo, &locations));

    for (uint32_t i = 0; i < spacesToLocate.size(); i++) {
        const auto positionAndOrientationTracked =
          XR_SPACE_LOCATION_POSITION_TRACKED_BIT |
XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT;
        const auto orientationOnlyTracked = XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT;

        if ((locationBuffer[i].locationFlags & positionAndOrientationTracked) ==
positionAndOrientationTracked) {
            // if the location is 6dof tracked
            do_something(locationBuffer[i].pose.position);
            do_something(locationBuffer[i].pose.orientation);

            const auto velocityValidBits =
              XR_SPACE_VELOCITY_LINEAR_VALID_BIT | XR_SPACE_VELOCITY_ANGULAR_VALID_BIT;
            if ((velocityBuffer[i].velocityFlags & velocityValidBits) ==
```

```
velocityValidBits) {
                do_something(velocityBuffer[i].linearVelocity);
                do_something(velocityBuffer[i].angularVelocity);
            }
        }
        else if ((locationBuffer[i].locationFlags & orientationOnlyTracked) ==
orientationOnlyTracked) {
            // if the location is 3dof tracked
            do_something(locationBuffer[i].pose.orientation);

            if ((velocityBuffer[i].velocityFlags & XR_SPACE_VELOCITY_ANGULAR_VALID_BIT)
== XR_SPACE_VELOCITY_ANGULAR_VALID_BIT) {
                do_something(velocityBuffer[i].angularVelocity);
            }
        }
    }
}
```

14.2.1. Overview

XR_KHR_maintenance1 adds a collection of minor features that were intentionally left out or overlooked from the original OpenXR 1.0 release. All are promoted to the OpenXR 1.1 release.

```
// Provided by XR_KHR_maintenance1
// XrColor3fKHR is an alias for XrColor3f
typedef struct XrColor3f {
    float    r;
    float    g;
    float    b;
} XrColor3f;

typedef XrColor3f XrColor3fKHR;
```

```
// Provided by XR_KHR_maintenance1
// XrExtent3DfKHR is an alias for XrExtent3Df
typedef struct XrExtent3Df {
    float    width;
    float    height;
    float    depth;
} XrExtent3Df;

typedef XrExtent3Df XrExtent3DfKHR;
```

```
// Provided by XR_KHR_maintenance1
// XrSpherefKHR is an alias for XrSpheref
typedef struct XrSpheref {
    XrPosef    center;
    float      radius;
} XrSpheref;

typedef XrSpheref XrSpherefKHR;
```

```
// Provided by XR_KHR_maintenance1
// XrBoxfKHR is an alias for XrBoxf
typedef struct XrBoxf {
    XrPosef        center;
    XrExtent3Df    extents;
} XrBoxf;

typedef XrBoxf XrBoxfKHR;
```

```
// Provided by XR_KHR_maintenance1
// XrFrustumfKHR is an alias for XrFrustumf
typedef struct XrFrustumf {
    XrPosef    pose;
    XrFovf     fov;
    float      nearZ;
    float      farZ;
} XrFrustumf;

typedef XrFrustumf XrFrustumfKHR;
```

14.2.2. New Structures

- XrBoxfKHR

- XrColor3fKHR
- XrExtent3DfKHR
- XrFrustumfKHR
- XrSpherefKHR

14.2.3. New Enum Constants

- `XR_KHR_MAINTENANCE1_EXTENSION_NAME`
- `XR_KHR_maintenance1_SPEC_VERSION`
- Extending XrResult:
  - `XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED_KHR`
  - `XR_ERROR_PERMISSION_INSUFFICIENT_KHR`

Overview

This extension added a new interaction profile path for the HP Reverb G2 Controllers:

- */interaction_profiles/hp/mixed_reality_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/hp/mixed_reality_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/hp/mixed_reality_controller_hp*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for the user paths

- */user/hand/left*
- */user/hand/right*

Supported component paths:

- On /user/hand/left only
  - *.../input/x/click*
  - *.../input/y/click*
- On /user/hand/right only
  - *.../input/a/click*

    - *.../input/b/click*
- On both hands
    - *.../input/menu/click*
    - *.../input/squeeze/value*
    - *.../input/trigger/value*
    - *.../input/thumbstick/x*
    - *.../input/thumbstick/y*
    - *.../input/thumbstick/click*
    - *.../input/grip/pose*
    - *.../input/aim/pose*
    - *.../output/haptic*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

Overview

The core OpenXR spec contains two world-locked reference space XrSpace types in XrReferenceSpaceType, `XR_REFERENCE_SPACE_TYPE_LOCAL` and `XR_REFERENCE_SPACE_TYPE_STAGE` with a design goal that `LOCAL` space gets the user positioned correctly in `XZ` space and `STAGE` gets the user

positioned correctly in Y space.

As defined in the core OpenXR spec, LOCAL space is useful when an application needs to render **seated-scale** content that is not positioned relative to the physical floor and STAGE space is useful when an application needs to render **standing-scale** content that is relative to the physical floor.

The core OpenXR specification describes that **standing-scale** experiences are meant to use the STAGE reference space. However, using the STAGE forces the user to move to the stage space in order to operate their experience, rather than just standing locally where they are.

Definition of the space

Similar to LOCAL space, the LOCAL_FLOOR reference space (XR_REFERENCE_SPACE_TYPE_LOCAL_FLOOR_EXT) establishes a world-locked origin, gravity-aligned to exclude pitch and roll, with +Y up, +X to the right, and -Z forward.

The location of the origin of the LOCAL_FLOOR space **must** match the LOCAL space in the X and Z coordinates but not in the Y coordinate.

The orientation of the LOCAL_FLOOR space **must** match the LOCAL space.

If the STAGE space is supported, then the floor level (Y coordinate) of the LOCAL_FLOOR space and the STAGE space **must** match.

If the STAGE space is not supported, then the runtime **must** give a best estimate of the floor level.

Note: The LOCAL_FLOOR space could be implemented by an application without support from the runtime by using the difference between in the Y coordinate of the pose of the LOCAL and STAGE reference spaces.

When this extension is enabled, a runtime **must** support XR_REFERENCE_SPACE_TYPE_LOCAL_FLOOR_EXT (in xrEnumerateReferenceSpaces).

When a user needs to recenter LOCAL space, the LOCAL_FLOOR space will also be recentered.

When such a recentering occurs, the runtime **must** queue the XrEventDataReferenceSpaceChangePending event, with the recentered LOCAL_FLOOR space origin only taking effect for xrLocateSpace or xrLocateViews calls whose XrTime parameter is greater than or equal to the changeTime provided in that event. Additionally, when the runtime changes the floor level (or the floor level estimate), the runtime **must** queue this event.

New Object Types

New Flag Types

New Enum Constants

XrReferenceSpaceType enumeration is extended with:

- XR_REFERENCE_SPACE_TYPE_LOCAL_FLOOR_EXT

New Enums

New Structures

Examples

If a runtime does not support the local floor extension, an application **can** construct an equivalent space using the LOCAL and STAGE spaces.

```
extern XrSession session;
extern bool supportsStageSpace;
extern bool supportsLocalFloorExtension;
extern XrTime curtime; // previously initialized

XrSpace localFloorSpace {XR_NULL_HANDLE};

if (supportsLocalFloorExtension)
{
    XrReferenceSpaceCreateInfo localFloorCreateInfo {
        .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
        .referenceSpaceType = XR_REFERENCE_SPACE_TYPE_LOCAL_FLOOR_EXT,
        .poseInReferenceSpace = {{0.f, 0.f, 0.f, 1.f}, {0.f, 0.f, 0.f}},
    };
    CHK_XR(xrCreateReferenceSpace(session, &localFloorCreateInfo, &localFloorSpace));
}
else if (supportsStageSpace)
{
    XrSpace localSpace {XR_NULL_HANDLE};
    XrSpace stageSpace {XR_NULL_HANDLE};

    XrReferenceSpaceCreateInfo createInfo {
        .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
        .poseInReferenceSpace = {
            .orientation = {
                .w = 1.f,
            },
        },
    };

    createInfo.referenceSpaceType = XR_REFERENCE_SPACE_TYPE_LOCAL;
    CHK_XR(xrCreateReferenceSpace(session, &createInfo, &localSpace));

    createInfo.referenceSpaceType = XR_REFERENCE_SPACE_TYPE_STAGE;
    CHK_XR(xrCreateReferenceSpace(session, &createInfo, &stageSpace));
```

```
    XrSpaceLocation stageLoc {
        .type = XR_TYPE_SPACE_LOCATION,
    };
    CHK_XR(xrLocateSpace(stageSpace, localSpace, curtime, &stageLoc));

    CHK_XR(xrDestroySpace(localSpace));
    CHK_XR(xrDestroySpace(stageSpace));

    float floorOffset = stageLoc.pose.position.y;

    XrReferenceSpaceCreateInfo localFloorCreateInfo {
        .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
        .referenceSpaceType = XR_REFERENCE_SPACE_TYPE_LOCAL,
        .poseInReferenceSpace = {{0.f, 0.f, 0.f, 1.f}, {0.f, floorOffset, 0.f}},
    };
    CHK_XR(xrCreateReferenceSpace(session, &localFloorCreateInfo, &localFloorSpace));
}
else
{
    // We do not support local floor or stage - make an educated guess
    float floorOffset = -1.5;

    XrReferenceSpaceCreateInfo localFloorCreateInfo {
        .type = XR_TYPE_REFERENCE_SPACE_CREATE_INFO,
        .referenceSpaceType = XR_REFERENCE_SPACE_TYPE_LOCAL,
        .poseInReferenceSpace = {{0.f, 0.f, 0.f, 1.f}, {0.f, floorOffset, 0.f}},
    };
    CHK_XR(xrCreateReferenceSpace(session, &localFloorCreateInfo, &localFloorSpace));
}
```

Overview

This extension defines a new "standard pose identifier" for interaction profiles, named "palm_ext". The new identifier is a pose that can be used to place application-specific visual content such as avatar visuals that may or may not match human hands. This extension also adds a new input component path using this "palm_ext" pose identifier to existing interaction profiles when active.

The application **can** use the *.../input/palm_ext/pose* component path to place visual content representing the user's physical hand location. Application visuals may depict, for example, realistic human hands that are very simply animated or creative depictions such as an animal, an alien, or robot limb extremity.

Note that this is not intended to be an alternative to extensions that perform hand tracking for more complex use cases: the use of "palm" in the name is to reflect that it is a user-focused pose rather than a held-object-focused pose.

Note

OpenXR 1.1 replaces *.../input/palm_ext/pose* with *.../input/grip_surface/pose.* The definitions of both poses are identical.

Pose Identifier

When this extension is active, a runtime **must** behave as if the following were added to the list of Standard pose identifiers.

- palm_ext - a pose that allows applications to reliably anchor visual content relative to the user's physical hand, whether the user's hand is tracked directly or its position and orientation is inferred by a physical controller. The palm pose is defined as follows:
  - The palm position: The user's physical palm centroid, at the surface of the palm.
  - The palm orientation's +X axis: When a user is holding the controller and straightens their index finger, the ray that is normal to the user's palm (away from the palm in the left hand, into the palm in the right hand).
  - The palm orientation's -Z axis: When a user is holding the controller and straightens their index finger, the ray that is parallel to their finger's pointing direction.
  - The palm orientation's +Y axis: orthogonal to +Z and +X using the right-hand rule.

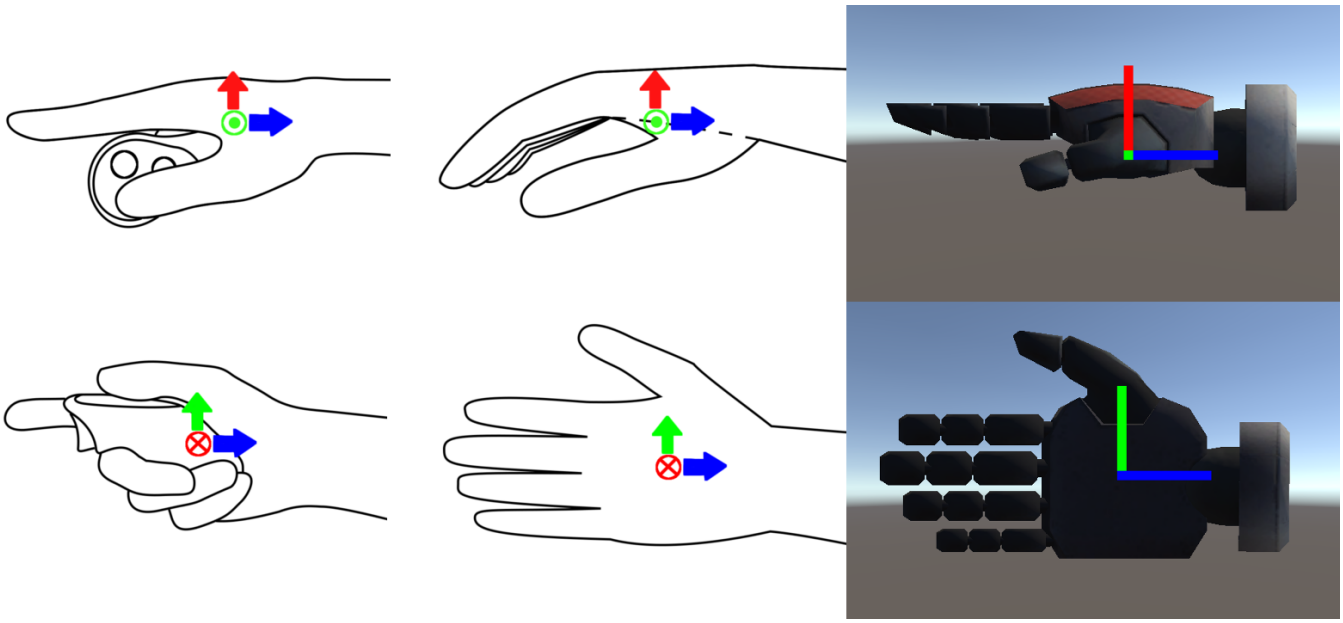

Figure 38. Example palm pose for (from left to right) a generic motion controller, tracked hand, and a digital hand avatar). The X axis is depicted in red. The Y axis is depicted in green. The Z axis is depicted in blue.

This pose is explicitly static for rigid controller type devices. The pose of *.../input/palm_ext/pose* and *.../input/grip_surface/pose* **must** be identical.

Interaction Profile Additions

When this extension is active, a runtime **must** accept the *.../input/palm_ext/pose* component path for all

interaction profiles that are valid for at least one of the user paths listed below listed below, including those interaction profiles enabled through extensions. Actions bound to such palm input component paths **must** behave as though those paths were listed in the original definition of an interaction profile.

Valid for the user paths

- */user/hand/left*
- */user/hand/right*

Supported component paths:

- On both user paths
  - *.../input/palm_ext/pose*

Note

While this extension itself does not add the *.../input/palm_ext/pose* input component path to interaction profiles defined in extensions, extension authors **may** update existing extensions to add this path, or submit new extensions defining new interaction profiles using this pose identifier and component path. For consistency, it is recommended that the *.../input/palm_ext/pose* path in extension-defined interaction profiles be specified as only valid when this `XR_EXT_palm_pose` extension is also enabled.

This extension does pose a challenge to API layer implementers attempting to provide interaction profile support through their layer. If a runtime implements `XR_EXT_palm_pose`, and an application enables it, but such an API layer is unaware of it, the runtime may "accept" (not error) the additional suggested binding but the layer will not know to provide data or indicate an active binding. This behavior, while unexpected, does not violate the specification, and does not substantially increase the difficulty of providing additional input support using an API layer.

Version History

- Revision 1, 2020-07-26 (Jack Pritz)
  - Initial extension proposal
- Revision 2, 2022-05-18 (Lachlan Ford)
  - Modification and cleanup of extension proposal based on working group discussion.
- Revision 3, 2023-11-16 (Ron Bessems)
  - Notes and clarification for the addition of *.../input/grip_surface/pose* to the core spec in OpenXR 1.1.

14.6.1. Overview

This extension enables applications to detect planes in the scene.

14.6.2. Runtime support

To determine if this runtime supports detecting planes xrGetSystemProperties **can** be used.

XrSystemPlaneDetectionPropertiesEXT provides information on the features supported by the runtime.

```
// Provided by XR_EXT_plane_detection
typedef struct XrSystemPlaneDetectionPropertiesEXT {
    XrStructureType                       type;
    void*                                 next;
    XrPlaneDetectionCapabilityFlagsEXT    supportedFeatures;
} XrSystemPlaneDetectionPropertiesEXT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportedFeatures` is a bitfield, with bit masks defined in XrPlaneDetectionCapabilityFlagBitsEXT.

Valid Usage (Implicit)

- The `XR_EXT_plane_detection` extension **must** be enabled prior to using XrSystemPlaneDetectionPropertiesEXT
- `type` **must** be `XR_TYPE_SYSTEM_PLANE_DETECTION_PROPERTIES_EXT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSystemPlaneDetectionPropertiesEXT::`supportedFeatures` member is of the following type, and contains a bitwise-OR of zero or more of the bits defined in XrPlaneDetectionCapabilityFlagBitsEXT.

```
// Provided by XR_EXT_plane_detection
typedef XrFlags64 XrPlaneDetectionCapabilityFlagsEXT;
```

Valid bits for XrPlaneDetectionCapabilityFlagsEXT are defined by XrPlaneDetectionCapabilityFlagBitsEXT, which is specified as:

```
// Provided by XR_EXT_plane_detection
// Flag bits for XrPlaneDetectionCapabilityFlagsEXT
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_PLANE_DETECTION_BIT_EXT = 0x00000001;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_PLANE_HOLES_BIT_EXT = 0x00000002;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_CEILING_BIT_EXT = 0x00000004;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_FLOOR_BIT_EXT = 0x00000008;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_WALL_BIT_EXT = 0x00000010;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_PLATFORM_BIT_EXT = 0x00000020;
static const XrPlaneDetectionCapabilityFlagsEXT
XR_PLANE_DETECTION_CAPABILITY_ORIENTATION_BIT_EXT = 0x00000040;
```

The flag bits have the following meanings:

Flag Descriptions

- `XR_PLANE_DETECTION_CAPABILITY_PLANE_DETECTION_BIT_EXT` — plane detection is supported
- `XR_PLANE_DETECTION_CAPABILITY_PLANE_HOLES_BIT_EXT` — polygon buffers for holes in planes can be generated
- `XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_CEILING_BIT_EXT` — plane detection supports ceiling semantic classification
- `XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_FLOOR_BIT_EXT` — plane detection supports floor semantic classification
- `XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_WALL_BIT_EXT` — plane detection supports wall semantic classification
- `XR_PLANE_DETECTION_CAPABILITY_SEMANTIC_PLATFORM_BIT_EXT` — plane detection supports platform semantic classification (for example table tops)
- `XR_PLANE_DETECTION_CAPABILITY_ORIENTATION_BIT_EXT` — plane detection supports plane orientation classification. If not supported planes are always classified as ARBITRARY.

14.6.3. Create a plane detection handle

```
// Provided by XR_EXT_plane_detection
XR_DEFINE_HANDLE(XrPlaneDetectorEXT)
```

The XrPlaneDetectorEXT handle represents the resources for detecting one or more planes.

An application **may** create separate XrPlaneDetectorEXT handles for different sets of planes. This handle **can** be used to detect planes using other functions in this extension.

Plane detection provides locations of planes in the scene.

The xrCreatePlaneDetectorEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrCreatePlaneDetectorEXT(
    XrSession                                   session,
    const XrPlaneDetectorCreateInfoEXT*         createInfo,
    XrPlaneDetectorEXT*                         planeDetector);
```

Parameter Descriptions

- `session` is an XrSession in which the plane detection will be active.
- `createInfo` is the XrPlaneDetectorCreateInfoEXT used to specify the plane detection.
- `planeDetector` is the returned XrPlaneDetectorEXT handle.

An application creates an XrPlaneDetectorEXT handle using xrCreatePlaneDetectorEXT function.

If the system does not support plane detection, the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreatePlaneDetectorEXT.

Valid Usage (Implicit)

- The `XR_EXT_plane_detection` extension **must** be enabled prior to calling xrCreatePlaneDetectorEXT
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrPlaneDetectorCreateInfoEXT structure
- `planeDetector` **must** be a pointer to an XrPlaneDetectorEXT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_PLANE_DETECTION_PERMISSION_DENIED_EXT
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrPlaneDetectorCreateInfoEXT structure is defined as:

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorCreateInfoEXT {
    XrStructureType            type;
    const void*                next;
    XrPlaneDetectorFlagsEXT    flags;
} XrPlaneDetectorCreateInfoEXT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- flags **must** be a valid combination of XrPlaneDetectorFlagsEXT flags or zero.

The XrPlaneDetectorCreateInfoEXT structure describes the information to create an XrPlaneDetectorEXT handle.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to using XrPlaneDetectorCreateInfoEXT
- type **must** be XR_TYPE_PLANE_DETECTOR_CREATE_INFO_EXT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- flags **must** be 0 or a valid combination of XrPlaneDetectorFlagBitsEXT values

The XrPlaneDetectorCreateInfoEXT::flags member is of the following type, and contains a bitwise-OR of zero or more of the bits defined in XrPlaneDetectorFlagBitsEXT.

```
// Provided by XR_EXT_plane_detection
typedef XrFlags64 XrPlaneDetectorFlagsEXT;
```

Valid bits for XrPlaneDetectorFlagsEXT are defined by XrPlaneDetectorFlagBitsEXT, which is specified as:

```
// Provided by XR_EXT_plane_detection
// Flag bits for XrPlaneDetectorFlagsEXT
static const XrPlaneDetectorFlagsEXT XR_PLANE_DETECTOR_ENABLE_CONTOUR_BIT_EXT =
0x00000001;
```

The flag bits have the following meanings:

Flag Descriptions

- XR_PLANE_DETECTOR_ENABLE_CONTOUR_BIT_EXT — populate the plane contour information

The xrDestroyPlaneDetectorEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrDestroyPlaneDetectorEXT(
    XrPlaneDetectorEXT                          planeDetector);
```

Parameter Descriptions

- planeDetector is an XrPlaneDetectorEXT previously created by xrCreatePlaneDetectorEXT.

xrDestroyPlaneDetectorEXT function releases the planeDetector and the underlying resources when finished with plane detection experiences.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to calling xrDestroyPlaneDetectorEXT
- planeDetector **must** be a valid XrPlaneDetectorEXT handle

Thread Safety

- Access to planeDetector, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

14.6.4. Detecting planes

The xrBeginPlaneDetectionEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrBeginPlaneDetectionEXT(
    XrPlaneDetectorEXT                          planeDetector,
    const XrPlaneDetectorBeginInfoEXT*          beginInfo);
```

Parameter Descriptions

- planeDetector is an XrPlaneDetectorEXT previously created by xrCreatePlaneDetectorEXT.
- beginInfo is a pointer to XrPlaneDetectorBeginInfoEXT containing plane detection parameters.

The xrBeginPlaneDetectionEXT function begins the detection of planes in the scene. Detecting planes in a scene is an asynchronous operation. xrGetPlaneDetectionStateEXT **can** be used to determine if the query has finished. Once it has finished the results **may** be retrieved via xrGetPlaneDetectionsEXT. If a detection has already been started on a plane detector handle, calling xrBeginPlaneDetectionEXT again on the same handle will cancel the operation in progress and start a new detection with the new filter parameters.

The bounding volume is resolved and fixed relative to LOCAL space at the time of the call to xrBeginPlaneDetectionEXT using XrPlaneDetectorBeginInfoEXT::baseSpace, XrPlaneDetectorBeginInfoEXT::time, XrPlaneDetectorBeginInfoEXT::boundingBoxPose and XrPlaneDetectorBeginInfoEXT::boundingBoxExtent. The runtime **must** resolve the location defined by XrPlaneDetectorBeginInfoEXT::baseSpace at the time of the call. The XrPlaneDetectorBeginInfoEXT ::boundingBoxPose is the pose of the center of the box defined by XrPlaneDetectorBeginInfoEXT ::boundingBoxExtent.

The runtime **must** return XR_ERROR_SPACE_NOT_LOCATABLE_EXT if the XrPlaneDetectorBeginInfoEXT ::baseSpace is not locatable at the time of the call.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to calling xrBeginPlaneDetectionEXT
- planeDetector **must** be a valid XrPlaneDetectorEXT handle
- beginInfo **must** be a pointer to a valid XrPlaneDetectorBeginInfoEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_NOT_LOCATABLE_EXT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrPlaneDetectorBeginInfoEXT structure describes the information to detect planes.

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorBeginInfoEXT {
    XrStructureType                           type;
    const void*                               next;
    XrSpace                                   baseSpace;
    XrTime                                    time;
    uint32_t                                  orientationCount;
    const XrPlaneDetectorOrientationEXT*      orientations;
    uint32_t                                  semanticTypeCount;
    const XrPlaneDetectorSemanticTypeEXT*     semanticTypes;
    uint32_t                                  maxPlanes;
    float                                     minArea;
    XrPosef                                   boundingBoxPose;
    XrExtent3DfEXT                            boundingBoxExtent;
} XrPlaneDetectorBeginInfoEXT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is the XrSpace that the `boundingBoxPose` is defined in.
- `time` is an `XrTime` at which to detect the planes.
- `orientationCount` the number of elements in the `orientations`.
- `orientations` an array of XrPlaneDetectorOrientationEXT. If this field is null no orientation filtering is applied. If any orientations are present only planes with any of the orientation listed are returned.
- `semanticTypeCount` the number of elements in the `semanticTypes`.
- `semanticTypes` an array of XrPlaneDetectorSemanticTypeEXT. If this field is null no semantic type filtering is applied. If any semantic types are present only planes with matching semantic types are returned.
- `maxPlanes` is the maximum number of planes the runtime **may** return. This number **must** be larger than 0. If the number is 0 the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.
- `minArea` is the minimum area in square meters a plane **must** have to be returned. A runtime **may** have a lower limit under which planes are not detected regardless of `minArea` and silently drop planes lower than the internal minimum.
- `boundingBoxPose` is the pose of the center of the bounding box of the volume to use for detection in `baseSpace`.
- `boundingBoxExtent` is the extent of the bounding box to use for detection. If any part of a plane falls within the bounding box it **should** be considered for inclusion subject to the other filters. This means that planes **may** extend beyond the bounding box. A runtime **may** have an upper limit on the detection range and silently clip the results to that internally.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to using XrPlaneDetectorBeginInfoEXT
- type **must** be XR_TYPE_PLANE_DETECTOR_BEGIN_INFO_EXT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- baseSpace **must** be a valid XrSpace handle
- If orientationCount is not 0, orientations **must** be a pointer to an array of orientationCount valid XrPlaneDetectorOrientationEXT values
- If semanticTypeCount is not 0, semanticTypes **must** be a pointer to an array of semanticTypeCount valid XrPlaneDetectorSemanticTypeEXT values

The xrGetPlaneDetectionStateEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrGetPlaneDetectionStateEXT(
    XrPlaneDetectorEXT                          planeDetector,
    XrPlaneDetectionStateEXT*                   state);
```

Parameter Descriptions

- planeDetector is an XrPlaneDetectorEXT previously created by xrCreatePlaneDetectorEXT.
- state is a pointer to XrPlaneDetectionStateEXT.

The xrGetPlaneDetectionStateEXT function retrieves the state of the plane query and **must** be called before calling xrGetPlaneDetectionsEXT.

If the plane detection has not yet finished state **must** be XR_PLANE_DETECTION_STATE_PENDING_EXT. If the plane detection has finished state **must** be XR_PLANE_DETECTION_STATE_DONE_EXT. If no plane detection was previously started XR_PLANE_DETECTION_STATE_NONE_EXT **must** be returned. For all three states the function **must** return XR_SUCCESS.

When a query error occurs the function **must** return XR_SUCCESS and the appropriate error state value **must** be set.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to calling xrGetPlaneDetectionStateEXT
- `planeDetector` **must** be a valid XrPlaneDetectorEXT handle
- `state` **must** be a pointer to an XrPlaneDetectionStateEXT value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrGetPlaneDetectionsEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrGetPlaneDetectionsEXT(
    XrPlaneDetectorEXT                          planeDetector,
    const XrPlaneDetectorGetInfoEXT*            info,
    XrPlaneDetectorLocationsEXT*                locations);
```

Parameter Descriptions

- `planeDetector` is an XrPlaneDetectorEXT previously created by xrCreatePlaneDetectorEXT.
- `info` is a pointer to XrPlaneDetectorGetInfoEXT.
- `locations` is a pointer to XrPlaneDetectorLocationsEXT receiving the returned plane locations.

xrGetPlaneDetectionsEXT **must** return XR_ERROR_CALL_ORDER_INVALID if the detector state reported by

xrGetPlaneDetectionStateEXT is not XR_PLANE_DETECTION_STATE_DONE_EXT for the current query started by xrBeginPlaneDetectionEXT.

If the XrPlaneDetectorGetInfoEXT::baseSpace is not locatable XR_ERROR_SPACE_NOT_LOCATABLE_EXT **must** be returned.

Once xrBeginPlaneDetectionEXT is called again, the previous results for that handle are no longer available. The application **should** cache them before calling xrBeginPlaneDetectionEXT again if it needs access to that data while waiting for updated detection results.

Upon the completion of a detection cycle (xrBeginPlaneDetectionEXT, xrGetPlaneDetectionStateEXT to xrGetPlaneDetectionsEXT) the runtime **must** keep a snapshot of the plane data and no data **may** be modified. Calling xrGetPlaneDetectionsEXT multiple times with the same baseSpace and time **must** return the same plane pose data.

The current snapshot, if any, **must** be discarded upon calling xrBeginPlaneDetectionEXT.

If the XrEventDataReferenceSpaceChangePending is queued and the changeTime elapsed while the application is holding cached data the application **may** use the event data to adjust the poses accordingly.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to calling xrGetPlaneDetectionsEXT
- `planeDetector` **must** be a valid XrPlaneDetectorEXT handle
- `info` **must** be a pointer to a valid XrPlaneDetectorGetInfoEXT structure
- `locations` **must** be a pointer to an XrPlaneDetectorLocationsEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CALL_ORDER_INVALID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPACE_NOT_LOCATABLE_EXT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

XrPlaneDetectorGetInfoEXT structure contains the information required to retrieve the detected planes.

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorGetInfoEXT {
    XrStructureType    type;
    const void*        next;
    XrSpace            baseSpace;
    XrTime             time;
} XrPlaneDetectorGetInfoEXT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- baseSpace the plane pose will be relative to this XrSpace at time.
- time is the XrTime at which to evaluate the coordinates relative to the baseSpace.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to using XrPlaneDetectorGetInfoEXT
- type **must** be XR_TYPE_PLANE_DETECTOR_GET_INFO_EXT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- baseSpace **must** be a valid XrSpace handle

XrPlaneDetectorLocationsEXT structure contains information on the detected planes.

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorLocationsEXT {
    XrStructureType                 type;
    void*                           next;
    uint32_t                        planeLocationCapacityInput;
    uint32_t                        planeLocationCountOutput;
    XrPlaneDetectorLocationEXT*     planeLocations;
} XrPlaneDetectorLocationsEXT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- planeLocationCapacityInput is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- planeLocationCountOutput is the number of planes, or the required capacity in the case that planeLocationCapacityInput is insufficient.
- planeLocations is an array of XrPlaneDetectorLocationEXT. It **can** be NULL if planeLocationCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required planeLocations size.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to using XrPlaneDetectorLocationsEXT
- type **must** be XR_TYPE_PLANE_DETECTOR_LOCATIONS_EXT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If planeLocationCapacityInput is not 0, planeLocations **must** be a pointer to an array of planeLocationCapacityInput XrPlaneDetectorLocationEXT structures

XrPlaneDetectorLocationEXT structure describes the position and orientation of a plane.

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorLocationEXT {
    XrStructureType                   type;
    void*                             next;
    uint64_t                          planeId;
    XrSpaceLocationFlags              locationFlags;
    XrPosef                           pose;
    XrExtent2Df                       extents;
    XrPlaneDetectorOrientationEXT     orientation;
    XrPlaneDetectorSemanticTypeEXT    semanticType;
    uint32_t                          polygonBufferCount;
} XrPlaneDetectorLocationEXT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `planeId` is a `uint64_t` unique identifier of the plane. The planeId **should** remain the same for the duration of the XrPlaneDetectorEXT handle for a physical plane. A runtime on occasion **may** assign a different id to the same physical plane, for example when several planes merge into one plane. `planeId` **must** remain valid until the next call to xrBeginPlaneDetectionEXT or xrDestroyPlaneDetectorEXT. This id is used by xrGetPlanePolygonBufferEXT.
- `locationFlags` is a bitfield, with bit masks defined in XrSpaceLocationFlagBits, to indicate which members contain valid data. If none of the bits are set, no other fields in this structure **should** be considered to be valid or meaningful.
- `pose` is an XrPosef defining the position and orientation of the origin of a plane within the reference frame of the corresponding XrPlaneDetectorGetInfoEXT::`baseSpace`.
- `extents` is the extent of the plane along the x-axis (`extents.width`) and y-axis (`extents.height`) centered on the `pose`.
- `orientation` is the detected orientation of the plane.
- `semanticType` XrPlaneDetectorSemanticTypeEXT type of the plane.
- `polygonBufferCount` is the number of polygon buffers associated with this plane. If this is zero no polygon buffer was generated. The first polygon buffer is always the outside contour. If contours are requested with `XR_PLANE_DETECTOR_ENABLE_CONTOUR_BIT_EXT` this value **must** always be at least 1.

Valid Usage (Implicit)

- The `XR_EXT_plane_detection` extension **must** be enabled prior to using XrPlaneDetectorLocationEXT
- `type` **must** be `XR_TYPE_PLANE_DETECTOR_LOCATION_EXT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `locationFlags` **must** be `0` or a valid combination of XrSpaceLocationFlagBits values
- If `orientation` is not `0`, `orientation` **must** be a valid XrPlaneDetectorOrientationEXT value
- If `semanticType` is not `0`, `semanticType` **must** be a valid XrPlaneDetectorSemanticTypeEXT value

The XrPlaneDetectorOrientationEXT enumeration identifies the different general categories of orientations of detected planes.

```
// Provided by XR_EXT_plane_detection
typedef enum XrPlaneDetectorOrientationEXT {
    XR_PLANE_DETECTOR_ORIENTATION_HORIZONTAL_UPWARD_EXT = 0,
    XR_PLANE_DETECTOR_ORIENTATION_HORIZONTAL_DOWNWARD_EXT = 1,
    XR_PLANE_DETECTOR_ORIENTATION_VERTICAL_EXT = 2,
    XR_PLANE_DETECTOR_ORIENTATION_ARBITRARY_EXT = 3,
    XR_PLANE_DETECTOR_ORIENTATION_MAX_ENUM_EXT = 0x7FFFFFFF
} XrPlaneDetectorOrientationEXT;
```

The enums have the following meanings:

Enum	Description
XR_PLANE_DETECTOR_ORIENTATION_HORIZONTAL_UPWARD_EXT	The detected plane is horizontal and faces upward (e.g. floor).
XR_PLANE_DETECTOR_ORIENTATION_HORIZONTAL_DOWNWARD_EXT	The detected plane is horizontal and faces downward (e.g. ceiling).
XR_PLANE_DETECTOR_ORIENTATION_VERTICAL_EXT	The detected plane is vertical (e.g. wall).
XR_PLANE_DETECTOR_ORIENTATION_ARBITRARY_EXT	The detected plane has an arbitrary, non-vertical and non-horizontal orientation.

The XrPlaneDetectorSemanticTypeEXT enumeration identifies the different semantic types of detected planes.

```
// Provided by XR_EXT_plane_detection
typedef enum XrPlaneDetectorSemanticTypeEXT {
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_UNDEFINED_EXT = 0,
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_CEILING_EXT = 1,
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_FLOOR_EXT = 2,
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_WALL_EXT = 3,
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_PLATFORM_EXT = 4,
    XR_PLANE_DETECTOR_SEMANTIC_TYPE_MAX_ENUM_EXT = 0x7FFFFFFF
} XrPlaneDetectorSemanticTypeEXT;
```

The enums have the following meanings:

Enum	Description
XR_PLANE_DETECTOR_SEMANTIC_TYPE_UNDEFINED_EXT	The runtime was unable to classify this plane.
XR_PLANE_DETECTOR_SEMANTIC_TYPE_CEILING_EXT	The detected plane is a ceiling.
XR_PLANE_DETECTOR_SEMANTIC_TYPE_FLOOR_EXT	The detected plane is a floor.
XR_PLANE_DETECTOR_SEMANTIC_TYPE_WALL_EXT	The detected plane is a wall.

Enum	Description
XR_PLANE_DETECTOR_SEMANTIC_TYPE_PLATFORM_EXT	The detected plane is a platform, like a table.

The XrPlaneDetectionStateEXT enumeration identifies the possible states of the plane detector.

```
// Provided by XR_EXT_plane_detection
typedef enum XrPlaneDetectionStateEXT {
    XR_PLANE_DETECTION_STATE_NONE_EXT = 0,
    XR_PLANE_DETECTION_STATE_PENDING_EXT = 1,
    XR_PLANE_DETECTION_STATE_DONE_EXT = 2,
    XR_PLANE_DETECTION_STATE_ERROR_EXT = 3,
    XR_PLANE_DETECTION_STATE_FATAL_EXT = 4,
    XR_PLANE_DETECTION_STATE_MAX_ENUM_EXT = 0x7FFFFFFF
} XrPlaneDetectionStateEXT;
```

Enumerant Descriptions

- XR_PLANE_DETECTION_STATE_NONE_EXT - The plane detector is not actively looking for planes; call xrBeginPlaneDetectionEXT to start detection.
- XR_PLANE_DETECTION_STATE_PENDING_EXT - This plane detector is currently looking for planes but not yet ready with results; call xrGetPlaneDetectionsEXT again, or call xrBeginPlaneDetectionEXT to restart with new filter parameters.
- XR_PLANE_DETECTION_STATE_DONE_EXT - This plane detector has finished and results **may** now be retrieved. The results are valid until xrBeginPlaneDetectionEXT or xrDestroyPlaneDetectorEXT are called.
- XR_PLANE_DETECTION_STATE_ERROR_EXT - An error occurred. The query **may** be tried again.
- XR_PLANE_DETECTION_STATE_FATAL_EXT - An error occurred. The query **must** not be tried again.

14.6.5. Read plane polygon vertices

The xrGetPlanePolygonBufferEXT function is defined as:

```
// Provided by XR_EXT_plane_detection
XrResult xrGetPlanePolygonBufferEXT(
    XrPlaneDetectorEXT                          planeDetector,
    uint64_t                                    planeId,
    uint32_t                                    polygonBufferIndex,
    XrPlaneDetectorPolygonBufferEXT*            polygonBuffer);
```

Parameter Descriptions

- `planeDetector` is an XrPlaneDetectorEXT previously created by xrCreatePlaneDetectorEXT.
- `planeId` is the XrPlaneDetectorLocationEXT::`planeId`.
- `polygonBufferIndex` is the index of the polygon contour buffer to retrieve. This **must** be a number from 0 to XrPlaneDetectorLocationEXT:polygonBufferCount -1. Index 0 retrieves the outside contour, larger indexes retrieve holes in the plane.
- `polygonBuffer` is a pointer to XrPlaneDetectorPolygonBufferEXT receiving the returned plane polygon buffer.

The xrGetPlanePolygonBufferEXT function retrieves the plane's polygon buffer for the given `planeId` and `polygonBufferIndex`. Calling xrGetPlanePolygonBufferEXT with `polygonBufferIndex` equal to 0 **must** return the outside contour, if available. Calls with non-zero indices less than XrPlaneDetectorLocationEXT::`polygonBufferCount` **must** return polygons corresponding to holes in the plane. This feature **may** not be supported by all runtimes, check the XrSystemPlaneDetectionPropertiesEXT::`supportedFeatures` for support.

Outside contour polygon vertices **must** be ordered in counter clockwise order. Vertices of holes **must** be ordered in clockwise order. The right-hand rule is used to determine the direction of the normal of this plane. The polygon contour data is relative to the pose of the plane and coplanar with it.

This function only retrieves polygons, which means that it needs to be converted to a regular mesh to be rendered.

Valid Usage (Implicit)

- The `XR_EXT_plane_detection` extension **must** be enabled prior to calling xrGetPlanePolygonBufferEXT
- `planeDetector` **must** be a valid XrPlaneDetectorEXT handle
- `polygonBuffer` **must** be a pointer to an XrPlaneDetectorPolygonBufferEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

XrPlaneDetectorPolygonBufferEXT is an input/output structure for reading plane contour polygon vertices.

```
// Provided by XR_EXT_plane_detection
typedef struct XrPlaneDetectorPolygonBufferEXT {
    XrStructureType    type;
    void*              next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector2f*        vertices;
} XrPlaneDetectorPolygonBufferEXT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- vertexCapacityInput is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- vertexCountOutput is the count of vertices written, or the required capacity in the case that vertexCapacityInput is insufficient.
- vertices is an array of XrVector2f that **must** be filled by the runtime with the positions of the polygon vertices relative to the plane's pose.

Valid Usage (Implicit)

- The XR_EXT_plane_detection extension **must** be enabled prior to using XrPlaneDetectorPolygonBufferEXT
- type **must** be XR_TYPE_PLANE_DETECTOR_POLYGON_BUFFER_EXT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If vertexCapacityInput is not 0, vertices **must** be a pointer to an array of vertexCapacityInput XrVector2f structures

The XrExtent3DfEXT structure is defined as:

```
// Provided by XR_EXT_plane_detection
// XrExtent3DfEXT is an alias for XrExtent3Df
typedef struct XrExtent3Df {
    float    width;
    float    height;
    float    depth;
} XrExtent3Df;

typedef XrExtent3Df XrExtent3DfEXT;
```

Member Descriptions

- width the floating-point width of the extent.
- height the floating-point height of the extent.
- depth the floating-point depth of the extent.

The XrExtent3DfEXT structure describes a axis aligned three-dimensional floating-point extent: This structure is used for component values that **may** be fractional (floating-point). If used to represent physical distances, values **must** be in meters.

The width (X), height (Y) and depth (Z) values **must** be non-negative.

14.6.6. Example code for locating planes

The following example code demonstrates how to detect planes relative to a local space.

```
XrInstance instance;  // previously initialized
XrSystemId systemId;  // previously initialized
XrSession session;    // previously initialized
```

```
XrSpace localSpace;   // previously initialized, e.g. from
                      // XR_REFERENCE_SPACE_TYPE_LOCAL
XrSpace viewSpace;    // previously initialized, e.g. from
                      // XR_REFERENCE_SPACE_TYPE_VIEW

// The function pointers are previously initialized using
// xrGetInstanceProcAddr.
PFN_xrCreatePlaneDetectorEXT xrCreatePlaneDetectorEXT; // previously initialized
PFN_xrBeginPlaneDetectionEXT xrBeginPlaneDetectionEXT; // previously initialized
PFN_xrGetPlaneDetectionStateEXT xrGetPlaneDetectionStateEXT; // previously initialized
PFN_xrGetPlaneDetectionsEXT xrGetPlaneDetectionsEXT; // previously initialized
PFN_xrGetPlanePolygonBufferEXT xrGetPlanePolygonBufferEXT; // previously initialized

XrSystemPlaneDetectionPropertiesEXT planeDetectionProperties {
  .type = XR_TYPE_SYSTEM_PLANE_DETECTION_PROPERTIES_EXT,
};
XrSystemProperties systemProperties {
  .type = XR_TYPE_SYSTEM_PROPERTIES,
  .next = &planeDetectionProperties,
};

CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!(planeDetectionProperties.supportedFeatures &
XR_PLANE_DETECTION_CAPABILITY_PLANE_DETECTION_BIT_EXT )) {
  // plane detection is not supported.
  return;
}

// Create a plane detection
XrPlaneDetectorEXT planeDetector{};
{
    XrPlaneDetectorCreateInfoEXT createInfo {

Overview

This extension enables the application to differentiate the newer form factor of motion controller released with the Samsung Odyssey headset. It enables the application to customize the appearance and experience of the controller differently from the original mixed reality motion controller.

This extension added a new interaction profile */interaction_profiles/samsung/odyssey_controller* to describe the Odyssey controller. The action bindings of this interaction profile work exactly the same as the */interaction_profiles/microsoft/motion_controller* in terms of valid user paths and supported input and output component paths.

Note

The interaction profile path */interaction_profiles/samsung/odyssey_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/samsung/odyssey_controller_samsung*, to allow for modifications when promoted to a KHR extension or the core specification.

If the application does not do its own custom rendering for specific motion controllers, it **should** avoid using this extension and instead just use *.../microsoft/motion_controller*, as runtimes **should** treat both controllers equally when applications declare action bindings only for that profile.

If the application wants to customize rendering for specific motion controllers, it **should** setup the suggested bindings for *.../samsung/odyssey_controller* the same as *.../microsoft/motion_controller* when calling xrSuggestInteractionProfileBindings, and expect the same action bindings. Then the application **can** listen to the XrEventDataInteractionProfileChanged event and inspect the returned interaction profile from xrGetCurrentInteractionProfile to differentiate which controller is being used by the user, and hence customize the appearance or experience of the motion controller specifically for the form factor of *.../samsung/odyssey_controller*.

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

Overview

This extension defines a Universally Unique Identifier that follows RFC 4122.

The XrUuidEXT structure is a 128-bit Universally Unique Identifier and is defined as:

```
// Provided by XR_EXT_uuid
// XrUuidEXT is an alias for XrUuid
typedef struct XrUuid {
    uint8_t    data[XR_UUID_SIZE];
} XrUuid;

typedef XrUuid XrUuidEXT;
```

Member Descriptions

- `data` is a 128-bit Universally Unique Identifier.

The structure is composed of 16 octets, with the size and order of the fields defined in RFC 4122 section 4.1.2.

Valid Usage (Implicit)

- The `XR_FB_spatial_entity` extension **must** be enabled prior to using XrUuidEXT

14.9.1. Overview

This extension allows the application to persist, retrieve, and unpersist anchors on the current device for the current user, across application and device sessions. The anchors are persisted per app, as identified by their Android package name.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension depends on `XR_ANDROID_trackables` and exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission. The application **must** request the permission at runtime to use these functions:

- xrCreateDeviceAnchorPersistenceANDROID

(protection level: dangerous)

14.9.2. Deprecation note

The `XR_ANDROID_device_anchor_persistence` extension is now deprecated. Unlike typical OpenXR deprecations, its features are not replaced by a single successor. Instead, its functionality has been distributed across several different extensions.

System support, persistence data loading, and enumeration of persisted anchors is replaced by `XR_EXT_spatial_persistence`:

`XR_ANDROID_device_anchor_persistence` **functionality**	**Now available in**
XrSystemDeviceAnchorPersistencePropertiesANDROID & xrEnumerateSupportedPersistenceAnchorTypesANDROID	xrEnumerateSpatialPersistenceScopesEXT
XrDeviceAnchorPersistenceANDROID	XrSpatialPersistenceContextEXT
xrCreateDeviceAnchorPersistenceANDROID	xrCreateSpatialPersistenceContextAsyncEXT & xrCreateSpatialPersistenceContextCompleteEXT

XR_ANDROID_device_anchor_persistence **functionality**	**Now available in**
xrDestroyDeviceAnchorPersistenceANDROID	xrDestroySpatialPersistenceContextEXT
xrEnumeratePersistedAnchorsANDROID	Discover all persisted entities

Functions to persist and unpersist anchors are replaced by XR_EXT_spatial_persistence_operations:

XR_ANDROID_device_anchor_persistence **functionality**	**Now available in**
xrPersistAnchorANDROID & xrGetAnchorPersistStateANDROID	xrPersistSpatialEntityAsyncEXT & xrPersistSpatialEntityCompleteEXT
xrUnpersistAnchorANDROID	xrUnpersistSpatialEntityAsyncEXT & xrUnpersistSpatialEntityCompleteEXT

14.9.3. Inspect system capability

The XrSystemDeviceAnchorPersistencePropertiesANDROID structure is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
typedef struct XrSystemDeviceAnchorPersistencePropertiesANDROID {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsAnchorPersistence;
} XrSystemDeviceAnchorPersistencePropertiesANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- supportsAnchorPersistence is an XrBool32 indicating if the current system supports anchor persistence for spatial anchors.

An application inspects whether the system is capable of persisting spatial anchors (see xrCreateAnchorSpaceANDROID) by extending the XrSystemProperties with XrSystemDeviceAnchorPersistencePropertiesANDROID structure when calling xrGetSystemProperties.

To query the supported types for the supported trackable anchors an application calls xrEnumerateSupportedPersistenceAnchorTypesANDROID.

If and only if a runtime returns XR_FALSE for supportsAnchorPersistence, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from device anchor persistence functions that operate on a spatial anchor.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to using XrSystemDeviceAnchorPersistencePropertiesANDROID
- type **must** be XR_TYPE_SYSTEM_DEVICE_ANCHOR_PERSISTENCE_PROPERTIES_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrEnumerateSupportedPersistenceAnchorTypesANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrEnumerateSupportedPersistenceAnchorTypesANDROID(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    uint32_t                                    trackableTypeCapacityInput,
    uint32_t*                                   trackableTypeCountOutput,
    XrTrackableTypeANDROID*                     trackableTypes);
```

Parameter Descriptions

- instance is the XrInstance that creates the XrDeviceAnchorPersistenceANDROID.
- systemId is the XrSystemId that is enumerated for supported types.
- trackableTypeCapacityInput is the capacity of the trackableTypes, or 0 to retrieve the required capacity.
- trackableTypeCountOutput is a pointer to the count of trackableTypes written, or a pointer to the required capacity in the case that trackableTypeCapacityInput is insufficient.
- trackableTypes is a pointer to an array of XrTrackableTypeANDROID, but **can** be NULL if trackableTypeCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required trackableTypes size.

To check for support of anchor persistence on other XrTrackableTypeANDROID trackables the application calls xrEnumerateSupportedPersistenceAnchorTypesANDROID.

If and only if a runtime does not return a given XrTrackableTypeANDROID in the trackableTypes array, the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED from device anchor persistence functions that operate on an anchor of that type.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to calling xrEnumerateSupportedPersistenceAnchorTypesANDROID
- `instance` **must** be a valid XrInstance handle
- `trackableTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `trackableTypeCapacityInput` is not `0`, `trackableTypes` **must** be a pointer to an array of `trackableTypeCapacityInput` XrTrackableTypeANDROID values

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_SYSTEM_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

14.9.4. Create a device anchor persistence handle

An XrDeviceAnchorPersistenceANDROID is a handle that represents the resources required to persist anchors.

```
// Provided by XR_ANDROID_device_anchor_persistence
XR_DEFINE_HANDLE(XrDeviceAnchorPersistenceANDROID)
```

The xrCreateDeviceAnchorPersistenceANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrCreateDeviceAnchorPersistenceANDROID(
    XrSession                                       session,
    const XrDeviceAnchorPersistenceCreateInfoANDROID* createInfo,
    XrDeviceAnchorPersistenceANDROID*               outHandle);
```

Parameter Descriptions

- `session` is the XrSession that creates the XrDeviceAnchorPersistenceANDROID.
- `createInfo` is the XrDeviceAnchorPersistenceCreateInfoANDROID containing parameters for the XrDeviceAnchorPersistenceANDROID.
- `outHandle` is a pointer to a handle in which the created XrDeviceAnchorPersistenceANDROID is returned.

An application creates an XrDeviceAnchorPersistenceANDROID handle by calling xrCreateDeviceAnchorPersistenceANDROID.

This function starts off an asynchronous loading of the application's persisted data. All functions of this extensions, except xrDestroyDeviceAnchorPersistenceANDROID, **must** return `XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID` if the data loading is not complete. The application retries those functions at a later time.

The XrDeviceAnchorPersistenceANDROID handle **must** be eventually freed via the xrDestroyDeviceAnchorPersistenceANDROID function or by destroying the parent XrSession handle.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to calling xrCreateDeviceAnchorPersistenceANDROID
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrDeviceAnchorPersistenceCreateInfoANDROID structure
- `outHandle` **must** be a pointer to an XrDeviceAnchorPersistenceANDROID handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrDeviceAnchorPersistenceCreateInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
typedef struct XrDeviceAnchorPersistenceCreateInfoANDROID {
    XrStructureType    type;
    const void*        next;
} XrDeviceAnchorPersistenceCreateInfoANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

The XrDeviceAnchorPersistenceCreateInfoANDROID structure provides creation options for the XrDeviceAnchorPersistenceANDROID when passed to xrCreateDeviceAnchorPersistenceANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to using XrDeviceAnchorPersistenceCreateInfoANDROID
- `type` **must** be `XR_TYPE_DEVICE_ANCHOR_PERSISTENCE_CREATE_INFO_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The xrDestroyDeviceAnchorPersistenceANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrDestroyDeviceAnchorPersistenceANDROID(
    XrDeviceAnchorPersistenceANDROID            handle);
```

Parameter Descriptions

- `handle` is an XrDeviceAnchorPersistenceANDROID handle previously created by xrCreateDeviceAnchorPersistenceANDROID.

The xrDestroyDeviceAnchorPersistenceANDROID function destroys the device anchor persistence handle. After this call the runtime **may** free all related memory and resources.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to calling xrDestroyDeviceAnchorPersistenceANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle

Thread Safety

- Access to `handle`, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

14.9.5. Persist an anchor

The xrPersistAnchorANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrPersistAnchorANDROID(
    XrDeviceAnchorPersistenceANDROID            handle,
    const XrPersistedAnchorSpaceInfoANDROID*    persistedInfo,
    XrUuidEXT*                                  anchorIdOutput);
```

Parameter Descriptions

- handle is the XrDeviceAnchorPersistenceANDROID.
- persistedInfo is the XrPersistedAnchorSpaceInfoANDROID containing parameters for the anchor persistence.
- anchorIdOutput is a pointer to an XrUuidEXT in which the UUID of the persisted anchor is returned.

The application requests anchors to be persisted by calling xrPersistAnchorANDROID. The application **must** not assume a success return value means the anchor is immediately persisted. The application **should** use xrGetAnchorPersistStateANDROID to check the persist state of the anchor using the returned anchor XrUuidEXT.

- The runtime **must** return XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID if the persisted data loading for handle is not yet complete.
- The runtime **must** return XR_SUCCESS once the anchor has been queued for persistence.

To unpersist the anchor, the application calls xrUnpersistAnchorANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to calling xrPersistAnchorANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle
- `persistedInfo` **must** be a pointer to a valid XrPersistedAnchorSpaceInfoANDROID structure
- `anchorIdOutput` **must** be a pointer to an XrUuidEXT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_ANCHOR_NOT_OWNED_BY_CALLER_ANDROID
- XR_ERROR_ANCHOR_NOT_TRACKING_ANDROID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrPersistedAnchorSpaceInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
typedef struct XrPersistedAnchorSpaceInfoANDROID {
    XrStructureType    type;
    const void*        next;
    XrSpace            anchor;
} XrPersistedAnchorSpaceInfoANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `anchor` is an anchor XrSpace previously created by xrCreateAnchorSpaceANDROID to persist.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to using XrPersistedAnchorSpaceInfoANDROID
- `type` **must** be `XR_TYPE_PERSISTED_ANCHOR_SPACE_INFO_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `anchor` **must** be a valid XrSpace handle

The xrGetAnchorPersistStateANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrGetAnchorPersistStateANDROID(
    XrDeviceAnchorPersistenceANDROID            handle,
    const XrUuidEXT*                            anchorId,
    XrAnchorPersistStateANDROID*                persistState);
```

Parameter Descriptions

- `handle` is the XrDeviceAnchorPersistenceANDROID.
- `anchorId` is the XrUuidEXT of the anchor.
- `persistState` is a pointer to an XrAnchorPersistStateANDROID in which the state of the anchor is returned.

- The runtime **must** set `persistState` to `XR_ANCHOR_PERSIST_STATE_PERSIST_NOT_REQUESTED_ANDROID` if the anchor XrUuidEXT has not been requested for persistence.
- The runtime **must** return `XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID` if the persisted data of `anchorId` is not ready.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to calling xrGetAnchorPersistStateANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle
- `anchorId` **must** be a pointer to a valid XrUuidEXT structure
- `persistState` **must** be a pointer to an XrAnchorPersistStateANDROID value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrAnchorPersistStateANDROID enum is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
typedef enum XrAnchorPersistStateANDROID {
    XR_ANCHOR_PERSIST_STATE_PERSIST_NOT_REQUESTED_ANDROID = 0,
    XR_ANCHOR_PERSIST_STATE_PERSIST_PENDING_ANDROID = 1,
    XR_ANCHOR_PERSIST_STATE_PERSISTED_ANDROID = 2,
    XR_ANCHOR_PERSIST_STATE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrAnchorPersistStateANDROID;
```

Enum	Description
XR_ANCHOR_PERSIST_STATE_PERSIST_NOT_REQUESTED_ANDROID	Anchor has not been requested to be persisted by the app.

Enum	Description
XR_ANCHOR_PERSIST_STATE_PERSIST_PENDING_ANDROID	Anchor has been requested to be persisted but not persisted yet.
XR_ANCHOR_PERSIST_STATE_PERSISTED_ANDROID	Anchor has been successfully persisted by the runtime.

14.9.6. Enumerate persisted anchors

The xrEnumeratePersistedAnchorsANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrEnumeratePersistedAnchorsANDROID(
    XrDeviceAnchorPersistenceANDROID            handle,
    uint32_t                                    anchorIdCapacityInput,
    uint32_t*                                   anchorIdCountOutput,
    XrUuidEXT*                                  anchorIds);
```

Parameter Descriptions

- handle is the XrDeviceAnchorPersistenceANDROID.
- anchorIdCapacityInput is the capacity of the anchorIds array, or 0 to indicate a request to retrieve the required capacity.
- anchorIdCountOutput is a pointer to the count of anchorIds written, or a pointer to the required capacity in the case that anchorIdCapacityInput is insufficient.
- anchorIds is a pointer to an array of XrUuidEXT structures. It **can** be NULL if anchorIdCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required anchorIds size.

To enumerate all current persisted anchors, the application calls xrEnumeratePersistedAnchorsANDROID. anchorIds will hold the UUIDs of the persisted anchors up to the capacity of the array. Since anchors are persisted asynchronously, the count of persisted anchors **may** change in between calls, causing anchorIdCountOutput to differ as well. If the capacity is insufficient, the runtime **must** truncate the values to fit the output array and makes no guarantees about which anchors are returned. The runtime **must** return XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID if the persisted data loading for handle is not yet complete.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to calling xrEnumeratePersistedAnchorsANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle
- `anchorIdCountOutput` **must** be a pointer to a `uint32_t` value
- If `anchorIdCapacityInput` is not `0`, `anchorIds` **must** be a pointer to an array of `anchorIdCapacityInput` XrUuidEXT structures

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

14.9.7. Create an anchor from persisted data

The xrCreatePersistedAnchorSpaceANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrCreatePersistedAnchorSpaceANDROID(
    XrDeviceAnchorPersistenceANDROID            handle,
    const XrPersistedAnchorSpaceCreateInfoANDROID* createInfo,
    XrSpace*                                    anchorOutput);
```

Parameter Descriptions

- `handle` is the XrDeviceAnchorPersistenceANDROID.
- `createInfo` is the XrPersistedAnchorSpaceCreateInfoANDROID containing parameters for the anchor creation.
- `anchorOutput` is a pointer to an XrSpace in which the new anchor space is returned.

The application creates an XrSpace anchor from a previously persisted anchor by calling xrCreatePersistedAnchorSpaceANDROID with the same XrUuidEXT. This is another way of creating anchors as defined in `XR_ANDROID_trackables`.

- The runtime **must** return `XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID` if the persisted data loading for `handle` is not yet complete.
- The runtime **must** return `XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID` if the anchor XrUuidEXT is not found.
- If the XrUuidEXT refers to an anchor that has not reached the `XR_ANCHOR_PERSIST_STATE_PERSISTED_ANDROID` state yet, the runtime **must** return `XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID`.
- Despite the first parameter of this function being an XrDeviceAnchorPersistenceANDROID, the parent of the created XrSpace is the XrSession that is the parent of `handle`. The runtime **must** track the anchor until `anchorOutput` is destroyed.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to calling xrCreatePersistedAnchorSpaceANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle
- `createInfo` **must** be a pointer to a valid XrPersistedAnchorSpaceCreateInfoANDROID structure
- `anchorOutput` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrPersistedAnchorSpaceCreateInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
typedef struct XrPersistedAnchorSpaceCreateInfoANDROID {
    XrStructureType    type;
    const void*        next;
    XrUuidEXT          anchorId;
} XrPersistedAnchorSpaceCreateInfoANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- anchorId is the XrUuidEXT of the persisted anchor to create an anchor XrSpace from.

The XrPersistedAnchorSpaceCreateInfoANDROID structure provides creation options for the anchor when passed to xrCreateDeviceAnchorPersistenceANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_device_anchor_persistence extension **must** be enabled prior to using XrPersistedAnchorSpaceCreateInfoANDROID
- type **must** be XR_TYPE_PERSISTED_ANCHOR_SPACE_CREATE_INFO_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain

14.9.8. Unpersist a persisted anchor

The xrUnpersistAnchorANDROID function is defined as:

```
// Provided by XR_ANDROID_device_anchor_persistence
XrResult xrUnpersistAnchorANDROID(
    XrDeviceAnchorPersistenceANDROID            handle,
    const XrUuidEXT*                            anchorId);
```

Parameter Descriptions

- handle is the XrDeviceAnchorPersistenceANDROID.
- anchorId is the XrUuidEXT of the anchor to unpersist.

The application unpersists a persisted anchor by calling xrUnpersistAnchorANDROID and passing the anchor XrUuidEXT of the anchor to unpersist. The runtime **may** take some time to unpersist the anchor. Applications **should** use xrEnumeratePersistedAnchorsANDROID to verify that an anchor has been unpersisted before exiting. Anchor spaces that have been created from persisted anchors are unaffected by unpersisting and keep tracking as normal anchors.

- The runtime **must** return XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID if the persisted data is not ready.
- The runtime **must** return XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID if the anchor XrUuidEXT is not found.
- The runtime **must** guarantee that the anchor will be unpersisted, regardless if the anchor at the time of the call is in either pending or persisted state. I.e. A call to xrPersistAnchorANDROID followed by a call to xrUnpersistAnchorANDROID **must** always result in the anchor being unpersisted, or never persisted.

Valid Usage (Implicit)

- The `XR_ANDROID_device_anchor_persistence` extension **must** be enabled prior to calling xrUnpersistAnchorANDROID
- `handle` **must** be a valid XrDeviceAnchorPersistenceANDROID handle
- `anchorId` **must** be a pointer to a valid XrUuidEXT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_ANCHOR_ID_NOT_FOUND_ANDROID`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

14.9.9. Example code for anchor persistence

The following example code demonstrates how to inspect system capability, persist, enumerate and unpersist anchors, as well as creating an anchor from persisted anchor XrUuidEXT.

```
XrSession session; // previously initialized
XrSpace anchor; // previously initialized
XrSpace appSpace; // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrEnumerateSupportedPersistenceAnchorTypesANDROID
xrEnumerateSupportedPersistenceAnchorTypesANDROID; // previously initialized
PFN_xrCreateDeviceAnchorPersistenceANDROID xrCreateDeviceAnchorPersistenceANDROID; //
```

```
previously initialized
PFN_xrDestroyDeviceAnchorPersistenceANDROID xrDestroyDeviceAnchorPersistenceANDROID; //
previously initialized
PFN_xrPersistAnchorANDROID xrPersistAnchorANDROID; // previously initialized
PFN_xrGetAnchorPersistStateANDROID xrGetAnchorPersistStateANDROID; // previously
initialized
PFN_xrCreatePersistedAnchorSpaceANDROID xrCreatePersistedAnchorSpaceANDROID; //
previously initialized
PFN_xrEnumeratePersistedAnchorsANDROID xrEnumeratePersistedAnchorsANDROID; // previously
initialized
PFN_xrUnpersistAnchorANDROID xrUnpersistAnchorANDROID; // previously initialized

// Create a device anchor persistence handle
XrDeviceAnchorPersistenceCreateInfoANDROID persistenceHandleCreateInfo {
  .type = XR_TYPE_DEVICE_ANCHOR_PERSISTENCE_CREATE_INFO_ANDROID,
  .next = nullptr,
};

XrDeviceAnchorPersistenceANDROID persistenceHandle;
CHK_XR(xrCreateDeviceAnchorPersistenceANDROID(session, &persistenceHandleCreateInfo,
&persistenceHandle));

/// Persist an anchor
XrPersistedAnchorSpaceInfoANDROID anchorSpaceInfo {
  .type = XR_TYPE_PERSISTED_ANCHOR_SPACE_INFO_ANDROID,
  .next = nullptr,
  .anchor = anchor,
};

XrUuidEXT anchorId;
XrResult result;
do {
  result = xrPersistAnchorANDROID(
    persistenceHandle, &anchorSpaceInfo, &anchorId);
} while (result == XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID ||
         result == XR_ERROR_ANCHOR_NOT_TRACKING_ANDROID);
if (result != XR_SUCCESS) {
  // Handle errors
}

// ... Update loop ...
// Poll for anchor persist state to confirm if it was successfully persisted
XrAnchorPersistStateANDROID persistState;
CHK_XR(xrGetAnchorPersistStateANDROID(persistenceHandle, &anchorId, &persistState));
if (persistState == XR_ANCHOR_PERSIST_STATE_PERSISTED_ANDROID)  {
  // The anchor was persisted successfully
}
```

```
// Enumerate all persisted anchors
uint32_t anchorCountOutput = 0;
std::vector<XrUuidEXT> allAnchors;

CHK_XR(xrEnumeratePersistedAnchorsANDROID(
  persistenceHandle,
  anchorCountOutput,
  &anchorCountOutput,
  nullptr
));
allAnchors.resize(anchorCountOutput, XrUuidEXT{.data={0}});

// Fetch the actual anchors in an appropriately resized array.
CHK_XR(xrEnumeratePersistedAnchorsANDROID(
  persistenceHandle,
  anchorCountOutput,
  &anchorCountOutput,
  allAnchors.data()
));

// Creating an anchor from a previously persisted anchor using its UUID
XrTime updateTime; // Time used for the current frame's simulation update.
anchorId = allAnchors[0];

XrPersistedAnchorSpaceCreateInfoANDROID createInfo {
  .type = XR_TYPE_PERSISTED_ANCHOR_SPACE_CREATE_INFO_ANDROID,
  .next = nullptr,
  .anchorId = anchorId,
};

XrSpace anchorSpace = XR_NULL_HANDLE;
CHK_XR(xrCreatePersistedAnchorSpaceANDROID(
  persistenceHandle,
  &createInfo,
  &anchorSpace
));

// The anchor was found and retrieved from the local device successfully.
XrSpaceLocation anchorLocation {
  .type = XR_TYPE_SPACE_LOCATION,
};
CHK_XR(xrLocateSpace(anchorSpace, appSpace, updateTime, &anchorLocation));
XrPosef pose = anchorLocation.pose;

// Unpersist the anchor
do {
  result = xrUnpersistAnchorANDROID(persistenceHandle, &anchorId);
} while (result == XR_ERROR_PERSISTED_DATA_NOT_READY_ANDROID);
```

```
if (result != XR_SUCCESS) {
  // Handle errors
}

// Once app is done with all persistence related tasks
CHK_XR(xrDestroySpace(anchorSpace));
CHK_XR(xrDestroyDeviceAnchorPersistenceANDROID(persistenceHandle));
```

14.9.10. New Object Types

- XrDeviceAnchorPersistenceANDROID

14.9.11. New Commands

- xrCreateDeviceAnchorPersistenceANDROID
- xrCreatePersistedAnchorSpaceANDROID
- xrDestroyDeviceAnchorPersistenceANDROID
- xrEnumeratePersistedAnchorsANDROID
- xrEnumerateSupportedPersistenceAnchorTypesANDROID

14.10.1. Overview

This extension allows the application to perform raycasts against trackables in the environment.

Raycasts are useful for detecting objects in the environment that are in the trajectory of a ray from a given origin. For example:

- To determine where a floating object will fall when dropped, by using a vertical raycast.
- To determine where a user is looking, by using a forward-facing raycast.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension depends on `XR_ANDROID_trackables` and exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission.

(protection level: dangerous)

14.10.2. Query supported raycast capabilities

The xrEnumerateRaycastSupportedTrackableTypesANDROID function is defined as:

```
// Provided by XR_ANDROID_raycast
XrResult xrEnumerateRaycastSupportedTrackableTypesANDROID(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    uint32_t                                    trackableTypeCapacityInput,
    uint32_t*                                   trackableTypeCountOutput,
    XrTrackableTypeANDROID*                     trackableTypes);
```

Parameter Descriptions

- `instance` is the XrInstance from which `systemId` was retrieved.
- `systemId` is the `XrSystemId` whose supported trackable types for raycasting are being enumerated.
- `trackableTypeCapacityInput` is the capacity of the `trackableTypes`, or 0 to retrieve the required capacity.
- `trackableTypeCountOutput` is a pointer to the count of the array, or a pointer to the required capacity in the case that `trackableTypeCapacityInput` is insufficient.
- `trackableTypes` is a pointer to an array of XrTrackableTypeANDROID, but **can** be `NULL` if `trackableTypeCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `trackableTypes` size.

xrEnumerateRaycastSupportedTrackableTypesANDROID enumerates which trackable types the runtime supports raycasting for.

Valid Usage (Implicit)

- The `XR_ANDROID_raycast` extension **must** be enabled prior to calling xrEnumerateRaycastSupportedTrackableTypesANDROID
- `instance` **must** be a valid XrInstance handle
- `trackableTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `trackableTypeCapacityInput` is not `0`, `trackableTypes` **must** be a pointer to an array of `trackableTypeCapacityInput` XrTrackableTypeANDROID values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SYSTEM_INVALID
- XR_ERROR_VALIDATION_FAILURE

14.10.3. Performing a raycast

The xrRaycastANDROID function is defined as:

```
// Provided by XR_ANDROID_raycast
XrResult xrRaycastANDROID(
    XrSession                                   session,
    const XrRaycastInfoANDROID*                 rayInfo,
    XrRaycastHitResultsANDROID*                 results);
```

Parameter Descriptions

- session is the XrSession that the raycast is performed in.
- rayInfo is the XrRaycastInfoANDROID that describes the ray to cast.
- results is a pointer to the XrRaycastHitResultsANDROID that receives the results of the raycast.

To perform raycasts, the application calls xrRaycastANDROID.

- If a raycast intersects more trackables than XrRaycastInfoANDROID::maxResults, the runtime **must** return the hit results that are closest to the XrRaycastInfoANDROID::origin of the ray.
- If a raycast intersects a trackable of type XR_TRACKABLE_TYPE_PLANE_ANDROID, that is subsumed by another plane, the runtime **must** return the hit result for the subsuming plane only.
- The runtime **must** return the hit results in closest-to-farthest order from XrRaycastInfoANDROID

::origin along the XrRaycastInfoANDROID::trajectory vector.

- The runtime **must** return XR_ERROR_TRACKABLE_TYPE_NOT_SUPPORTED_ANDROID if the trackable type corresponding to the XrTrackableTrackerANDROID handles in XrRaycastInfoANDROID::trackers are not enumerated by xrEnumerateRaycastSupportedTrackableTypesANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_raycast extension **must** be enabled prior to calling xrRaycastANDROID
- session **must** be a valid XrSession handle
- rayInfo **must** be a pointer to a valid XrRaycastInfoANDROID structure
- results **must** be a pointer to an XrRaycastHitResultsANDROID structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_TRACKABLE_TYPE_NOT_SUPPORTED_ANDROID
- XR_ERROR_VALIDATION_FAILURE

The XrRaycastInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_raycast
typedef struct XrRaycastInfoANDROID {
    XrStructureType                     type;
    const void*                         next;
    uint32_t                            maxResults;
    uint32_t                            trackerCount;
    const XrTrackableTrackerANDROID*    trackers;
    XrVector3f                          origin;
    XrVector3f                          trajectory;
    XrSpace                             space;
    XrTime                              time;
} XrRaycastInfoANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `maxResults` is the `uint32_t` maximum number of results to return.
- `trackerCount` is the `uint32_t` count of the `trackers` array.
- `trackers` is the array of XrTrackableTrackerANDROID that the casted ray **should** be tested against.
- `origin` is the XrVector3f that the ray is cast from.
- `trajectory` is the XrVector3f that the ray is targeted at.
- `space` is the XrSpace that the ray is cast in.
- `time` is the `XrTime` the ray is cast at.

The XrRaycastInfoANDROID structure describes the ray to cast.

- The XrRaycastInfoANDROID::`trackers` array **may** contain trackers of different types.
- The XrRaycastInfoANDROID::`trackers` array **must** not contain multiple trackers of the same type, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The XR_ANDROID_raycast extension **must** be enabled prior to using XrRaycastInfoANDROID
- type **must** be XR_TYPE_RAYCAST_INFO_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- trackers **must** be a pointer to an array of trackerCount valid XrTrackableTrackerANDROID handles
- space **must** be a valid XrSpace handle
- The trackerCount parameter **must** be greater than 0
- Both of space and the elements of trackers **must** have been created, allocated, or retrieved from the same XrSession

The XrRaycastHitResultsANDROID structure is defined as:

```
// Provided by XR_ANDROID_raycast
typedef struct XrRaycastHitResultsANDROID {
    XrStructureType               type;
    void*                         next;
    uint32_t                      resultsCapacityInput;
    uint32_t                      resultsCountOutput;
    XrRaycastHitResultANDROID*    results;
} XrRaycastHitResultsANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- resultsCapacityInput is the capacity of the results array, or 0 to indicate a request to retrieve the required capacity.
- resultsCountOutput is a pointer to the count of results written, or a pointer to the required capacity in the case that resultsCapacityInput is insufficient.
- results is a pointer to an array of XrRaycastHitResultANDROID structures. It **can** be NULL if resultsCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required results size.

The XrRaycastHitResultsANDROID contains the array of hits of a raycast.

The runtime **must** set `resultsCountOutput` to be less than or equal to XrRaycastInfoANDROID ::`maxResults`.

Valid Usage (Implicit)

- The `XR_ANDROID_raycast` extension **must** be enabled prior to using XrRaycastHitResultsANDROID
- `type` **must** be `XR_TYPE_RAYCAST_HIT_RESULTS_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `resultsCapacityInput` is not `0`, `results` **must** be a pointer to an array of `resultsCapacityInput` XrRaycastHitResultANDROID-based structures

The XrRaycastHitResultANDROID structure is defined as:

```
// Provided by XR_ANDROID_raycast
typedef struct XrRaycastHitResultANDROID {
    XrTrackableTypeANDROID    type;
    XrTrackableANDROID        trackable;
    XrPosef                   pose;
} XrRaycastHitResultANDROID;
```

Member Descriptions

- `type` is the XrTrackableTypeANDROID of the trackable that the raycast hit.
- `trackable` is the `XrTrackableANDROID` that the raycast hit, or XR_NULL_TRACKABLE_ANDROID if the trackable `type` was `XR_TRACKABLE_TYPE_DEPTH_ANDROID`.
- `pose` is the XrPosef that the raycast hit.

The XrRaycastHitResultANDROID contains the details of a raycast hit.

The XrRaycastHitResultANDROID::`pose` for a plane hit **must** be such that X+ is perpendicular to the cast ray and parallel to the physical surface centered around the hit, Y+ points along the estimated surface normal, and Z+ points roughly toward the ray origin.

The XrRaycastHitResultANDROID::`pose` for a depth hit is analogous to a plane hit, using an estimated surface normal. X+ is perpendicular to the cast ray and parallel to the physical surface centered around the hit, Y+ points along the estimated surface normal, and Z+ points roughly toward the ray origin.

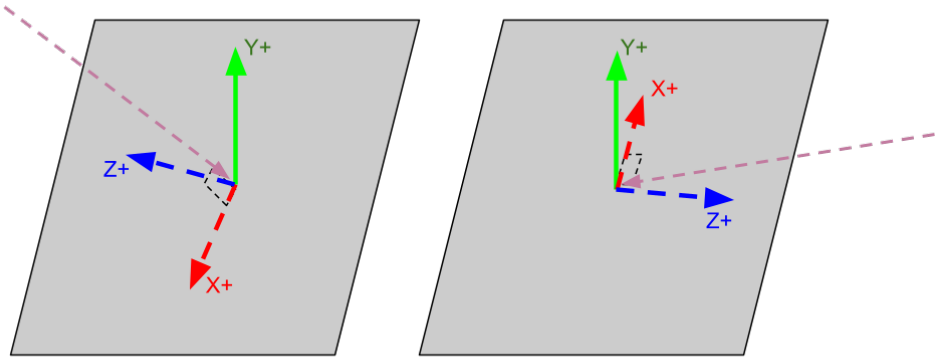

Figure 39. Example raycast hit orientation.

Type of trackable hit	Description
`XR_TRACKABLE_TYPE_PLANE_ANDROID`	Hits horizontal and/or vertical surfaces to determine a point's correct depth and orientation.
`XR_TRACKABLE_TYPE_DEPTH_ANDROID`	Uses depth information from the entire scene to determine a point's correct depth and orientation.

Other extensions **may** implement raycasting for other types of trackables.

Valid Usage (Implicit)

- The `XR_ANDROID_raycast` extension **must** be enabled prior to using XrRaycastHitResultANDROID

14.10.4. Example code for raycasting

The following example code demonstrates how to perform raycasts.

```
XrSession session; // previously initialized
XrTime updateTime; // previously initialized
XrSpace appSpace;  // space created for XR_REFERENCE_SPACE_TYPE_LOCAL.
XrPosef headPose;  // latest pose of the HMD.
XrTrackableTrackerANDROID planeTracker; // tracker for plane trackables.
XrTrackableTrackerANDROID depthTracker; // tracker for depth trackables.

PFN_xrRaycastANDROID xrRaycastANDROID; // previously initialized
XrVector3f CalculateForwardDirectionFromHeadPose(XrPosef); // defined elsewhere

// Perform a raycast against multiple trackers.
constexpr uint32_t NUM_DESIRED_RESULTS = 2;
XrTrackableTrackerANDROID trackers[] = {
  planeTracker,
  depthTracker,
};
XrRaycastInfoANDROID rayInfo = {
  .type = XR_TYPE_RAYCAST_INFO_ANDROID,
  .maxResults = NUM_DESIRED_RESULTS,
  .trackerCount = sizeof(trackers) / sizeof(XrTrackableTrackerANDROID),
  .trackers = trackers,
  .origin = headPose.position,
  .trajectory = CalculateForwardDirectionFromHeadPose(headPose),
  .space = appSpace,
  .time = updateTime,
};

uint32_t totalHitResults = 0;
XrRaycastHitResultANDROID hitResult[NUM_DESIRED_RESULTS]{};
XrRaycastHitResultsANDROID hitResults = {
  .type = XR_TYPE_RAYCAST_HIT_RESULTS_ANDROID,
  .resultsCapacityInput = NUM_DESIRED_RESULTS,
  .results = hitResult,
};
XrResult result = xrRaycastANDROID(session, &rayInfo, &hitResults);

if (result == XR_SUCCESS && hitResults.resultsCountOutput >= 1) {
  // Hit results are returned in closest-to-farthest order in
  // hitResults.results[0] .. hitResults.results[hitResults.resultsCountOutput - 1]
}
```

14.10.5. New Commands

- xrEnumerateRaycastSupportedTrackableTypesANDROID
- xrRaycastANDROID

14.10.6. New Structures

- XrRaycastHitResultANDROID
- XrRaycastHitResultsANDROID
- XrRaycastInfoANDROID

14.10.7. New Enum Constants

- `XR_ANDROID_RAYCAST_EXTENSION_NAME`
- `XR_ANDROID_raycast_SPEC_VERSION`
- Extending XrStructureType:
  - `XR_TYPE_RAYCAST_HIT_RESULTS_ANDROID`
  - `XR_TYPE_RAYCAST_INFO_ANDROID`
- Extending XrTrackableTypeANDROID:
  - `XR_TRACKABLE_TYPE_DEPTH_ANDROID`

14.11.1. Overview

This extension allows the application to access trackables from the physical environment, and create anchors attached to a trackable. It also allows applications to create world-locked spatial anchors.

A trackable is something that is tracked in the physical environment:

- a plane (e.g. wall, floor, ceiling, table)
- an object (e.g. keyboard, mouse, laptop)

See also XrTrackableTypeANDROID.

This extension defines plane trackables.

Additional trackable types are added by other extensions. For example, `XR_ANDROID_trackables_object` adds object trackables, and `XR_ANDROID_raycast` adds depth trackables that allow raycasting to arbitrary points in the environment.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission. The application **must** request the permission at runtime to use these functions:

- xrCreateTrackableTrackerANDROID

(protection level: dangerous)

14.11.2. Deprecation note

The `XR_ANDROID_trackables` extension is now deprecated. Unlike typical OpenXR deprecations, its features are not replaced by a single successor. Instead, its functionality has been distributed across several different extensions.

Trackable foundations are replaced by `XR_EXT_spatial_entity`:

`XR_ANDROID_trackables` **functionality**	**Now available in**
XrTrackableTypeANDROID	XrSpatialCapabilityEXT
xrEnumerateSupportedTrackableTypesANDROID	xrEnumerateSpatialCapabilitiesEXT
XrTrackableTrackerANDROID	XrSpatialContextEXT
xrCreateTrackableTrackerANDROID	xrCreateSpatialContextAsyncEXT & xrCreateSpatialContextCompleteEXT
xrDestroyTrackableTrackerANDROID	xrDestroySpatialContextEXT
`XrTrackableANDROID`	`XrSpatialEntityIdEXT`
XrTrackingStateANDROID	XrSpatialEntityTrackingStateEXT
xrGetAllTrackablesANDROID	xrCreateSpatialDiscoverySnapshotAsyncEXT, xrCreateSpatialDiscoverySnapshotCompleteEXT, & xrQuerySpatialComponentDataEXT (XrSpatialComponentDataQueryResultEXT::`entityIds`)

Plane trackables are replaced by `XR_EXT_spatial_plane_tracking` and `XR_ANDROID_spatial_component_subsumed_by`:

`XR_ANDROID_trackables` **functionality**	**Now available in**
XrPlaneTypeANDROID	XrSpatialPlaneAlignmentEXT
XrPlaneLabelANDROID	XrSpatialPlaneSemanticLabelEXT

XR_ANDROID_trackables functionality	Now available in
xrGetTrackablePlaneANDROID	xrQuerySpatialComponentDataEXT
XrTrackablePlaneANDROID::centerPose & XrTrackablePlaneANDROID::extents	Provided by Bounded 2D component
XrTrackablePlaneANDROID::vertices	Provided by Polygon 2D Component
XrTrackablePlaneANDROID::subsumedByPlane	Provided by Subsumed By Component

Anchors are replaced by XR_EXT_spatial_anchor, XR_ANDROID_spatial_entity_bound_anchor, and XR_ANDROID_spatial_anchor_space:

XR_ANDROID_trackables functionality	Now available in
xrEnumerateSupportedAnchorTrackableTypesANDROID	xrEnumerateSpatialAnchorAttachableComponentsANDROID
xrCreateAnchorSpaceANDROID	xrCreateSpatialAnchorEXT or xrCreateSpatialAnchorSpaceANDROID
XrAnchorSpaceCreateInfoANDROID::trackable	XrSpatialAnchorParentANDROID::parentId

14.11.3. Inspect system capability

The XrSystemTrackablesPropertiesANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables
typedef struct XrSystemTrackablesPropertiesANDROID {
    XrStructureType    type;
    const void*        next;
    XrBool32           supportsAnchor;
    uint32_t           maxAnchors;
} XrSystemTrackablesPropertiesANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- supportsAnchor is an XrBool32 indicating if current system supports anchor creation via xrCreateAnchorSpaceANDROID for spatial anchors.
- maxAnchors is the total maximum number of anchors supported by the runtime to be created via xrCreateAnchorSpaceANDROID of all types combined at any given time.

To inspect whether the system is capable of creating spatial anchors an application calls xrCreateAnchorSpaceANDROID by extending the XrSystemProperties with XrSystemTrackablesPropertiesANDROID structure when calling xrGetSystemProperties. The runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED for spatial anchor creation if and only if supportsAnchor is false.

If a runtime supports anchors, it **must** support maxAnchors active anchors at any given time.

To determine which trackable types are supported by the runtime for tracking and for anchor creation respectively an application calls xrEnumerateSupportedTrackableTypesANDROID and xrEnumerateSupportedAnchorTrackableTypesANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to using XrSystemTrackablesPropertiesANDROID
- type **must** be XR_TYPE_SYSTEM_TRACKABLES_PROPERTIES_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrEnumerateSupportedTrackableTypesANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrEnumerateSupportedTrackableTypesANDROID(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    uint32_t                                    trackableTypeCapacityInput,
    uint32_t*                                   trackableTypeCountOutput,
    XrTrackableTypeANDROID*                     trackableTypes);
```

Parameter Descriptions

- `instance` is the XrInstance that enumerates the supported trackable types.
- `systemId` is the `XrSystemId` of the system to query.
- `trackableTypeCapacityInput` is the capacity of the `trackableTypes`, or 0 to retrieve the required capacity.
- `trackableTypeCountOutput` is a pointer to the count of `uint64_t trackableTypes` written, or a pointer to the required capacity in the case that `trackableTypeCapacityInput` is insufficient.
- `trackableTypes` is a pointer to an array of XrTrackableTypeANDROID, but **can** be `NULL` if `trackableTypeCapacityInput` is `0`.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `trackableTypes` size.

xrEnumerateSupportedTrackableTypesANDROID enumerates the trackable types supported by the runtime for xrCreateTrackableTrackerANDROID.

If and only if a trackable type X is not returned by xrEnumerateSupportedTrackableTypesANDROID, then the runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` when calling xrCreateTrackableTrackerANDROID with X as the trackable type.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables` extension **must** be enabled prior to calling xrEnumerateSupportedTrackableTypesANDROID
- `instance` **must** be a valid XrInstance handle
- `trackableTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `trackableTypeCapacityInput` is not `0`, `trackableTypes` **must** be a pointer to an array of `trackableTypeCapacityInput` XrTrackableTypeANDROID values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SYSTEM_INVALID
- XR_ERROR_VALIDATION_FAILURE

The xrEnumerateSupportedAnchorTrackableTypesANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrEnumerateSupportedAnchorTrackableTypesANDROID(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    uint32_t                                    trackableTypeCapacityInput,
    uint32_t*                                   trackableTypeCountOutput,
    XrTrackableTypeANDROID*                     trackableTypes);
```

Parameter Descriptions

- instance is the XrInstance that enumerates the supported anchor trackable types.
- systemId is the XrSystemId of the system to query.
- trackableTypeCapacityInput is the capacity of the trackableTypes, or 0 to retrieve the required capacity.
- trackableTypeCountOutput is a pointer to the count of uint64_t trackableTypes written, or a pointer to the required capacity in the case that trackableTypeCapacityInput is insufficient.
- trackableTypes is a pointer to an array of XrTrackableTypeANDROID, but **can** be NULL if trackableTypeCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required trackableTypes size.

xrEnumerateSupportedAnchorTrackableTypesANDROID enumerates the trackable types supported by the runtime for anchor creation.

If and only if a trackable type X is not returned by xrEnumerateSupportedAnchorTrackableTypesANDROID, then the runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED when calling xrCreateAnchorSpaceANDROID with X as the trackable type.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to calling xrEnumerateSupportedAnchorTrackableTypesANDROID
- `instance` **must** be a valid XrInstance handle
- `trackableTypeCountOutput` **must** be a pointer to a `uint32_t` value
- If `trackableTypeCapacityInput` is not `0`, `trackableTypes` **must** be a pointer to an array of `trackableTypeCapacityInput` XrTrackableTypeANDROID values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SYSTEM_INVALID
- XR_ERROR_VALIDATION_FAILURE

14.11.4. Creating a trackable tracker

An XrTrackableTrackerANDROID is a handle that represents the resources required to discover and update trackables of a given XrTrackableTypeANDROID in the environment.

```
// Provided by XR_ANDROID_trackables
XR_DEFINE_HANDLE(XrTrackableTrackerANDROID)
```

The xrCreateTrackableTrackerANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrCreateTrackableTrackerANDROID(
    XrSession                                   session,
    const XrTrackableTrackerCreateInfoANDROID*  createInfo,
    XrTrackableTrackerANDROID*                  trackableTracker);
```

Parameter Descriptions

- `session` is the XrSession that creates the tracker.
- `createInfo` is a pointer to an XrTrackableTrackerCreateInfoANDROID structure containing parameters to be used to create the tracker.
- `trackableTracker` is a pointer to a handle in which the created XrTrackableTrackerANDROID is returned.

The application creates trackable trackers with xrCreateTrackableTrackerANDROID.

- The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if the system does not support trackables of the specified XrTrackableTrackerCreateInfoANDROID::`trackableType` as returned by xrEnumerateSupportedTrackableTypesANDROID.
- The runtime **must** return `XR_ERROR_PERMISSION_INSUFFICIENT` if the required permissions have not been granted to the calling app.

The XrTrackableTrackerANDROID handle **must** be eventually freed via the xrDestroyTrackableTrackerANDROID function or by destroying the parent XrSession handle.

The runtime **may** use the creation of an XrTrackableTrackerANDROID to prepare itself for discovering trackables of the selected XrTrackableTrackerCreateInfoANDROID::`trackableType`. For example, the runtime **may** only begin its plane tracking system when a trackable tracker handle for `XR_TRACKABLE_TYPE_PLANE_ANDROID` is created by the application.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables` extension **must** be enabled prior to calling xrCreateTrackableTrackerANDROID
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrTrackableTrackerCreateInfoANDROID structure
- `trackableTracker` **must** be a pointer to an XrTrackableTrackerANDROID handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrTrackableTrackerCreateInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables
typedef struct XrTrackableTrackerCreateInfoANDROID {
    XrStructureType           type;
    const void*               next;
    XrTrackableTypeANDROID    trackableType;
} XrTrackableTrackerCreateInfoANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- trackableType is the XrTrackableTypeANDROID that the tracker will track.

The XrTrackableTrackerCreateInfoANDROID structure is passed to xrCreateTrackableTrackerANDROID and provides creation options for the XrTrackableTrackerANDROID.

Extensions **may** define structures to be provided in the slinkXrTrackableTrackerCreateInfoANDROID::next chain to allow additional configuration for the

trackable trackers.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to using XrTrackableTrackerCreateInfoANDROID
- type **must** be XR_TYPE_TRACKABLE_TRACKER_CREATE_INFO_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrTrackableMarkerConfigurationANDROID, XrTrackableObjectConfigurationANDROID, XrTrackableQrCodeConfigurationANDROID
- trackableType **must** be a valid XrTrackableTypeANDROID value

The XrTrackableTypeANDROID enum is defined as:

```
// Provided by XR_ANDROID_trackables
typedef enum XrTrackableTypeANDROID {
    XR_TRACKABLE_TYPE_NOT_VALID_ANDROID = 0,
    XR_TRACKABLE_TYPE_PLANE_ANDROID = 1,
  // Provided by XR_ANDROID_raycast
    XR_TRACKABLE_TYPE_DEPTH_ANDROID = 1000463000,
  // Provided by XR_ANDROID_trackables_object
    XR_TRACKABLE_TYPE_OBJECT_ANDROID = 1000466000,
  // Provided by XR_ANDROID_trackables_marker
    XR_TRACKABLE_TYPE_MARKER_ANDROID = 1000707000,
  // Provided by XR_ANDROID_trackables_qr_code
    XR_TRACKABLE_TYPE_QR_CODE_ANDROID = 1000708000,
  // Provided by XR_ANDROID_trackables_image
    XR_TRACKABLE_TYPE_IMAGE_ANDROID = 1000709000,
    XR_TRACKABLE_TYPE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrTrackableTypeANDROID;
```

Enum	Description
XR_TRACKABLE_TYPE_NOT_VALID_ANDROID	Indicates that the trackable is not valid.
XR_TRACKABLE_TYPE_PLANE_ANDROID	Indicates that the trackable is a plane.
XR_TRACKABLE_TYPE_DEPTH_ANDROID	Indicates that the trackable is the perception depth buffer. (Added by the XR_ANDROID_raycast extension)
XR_TRACKABLE_TYPE_OBJECT_ANDROID	Indicates that the trackable is the object. (Added by the XR_ANDROID_trackables_object extension)

Enum	Description
XR_TRACKABLE_TYPE_MARKER_ANDROID	Indicates that the trackable is a marker. (Added by the XR_ANDROID_trackables_marker extension)
XR_TRACKABLE_TYPE_QR_CODE_ANDROID	Indicates that the trackable is a QR code. (Added by the XR_ANDROID_trackables_qr_code extension)
XR_TRACKABLE_TYPE_IMAGE_ANDROID	Indicates that the trackable is an image. (Added by the XR_ANDROID_trackables_image extension)

The xrDestroyTrackableTrackerANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrDestroyTrackableTrackerANDROID(
    XrTrackableTrackerANDROID                   trackableTracker);
```

Parameter Descriptions

- trackableTracker is an XrTrackableTrackerANDROID handle previously created by xrCreateTrackableTrackerANDROID.

The xrDestroyTrackableTrackerANDROID function destroys the trackable tracker. After this call the runtime **may** free all related memory and resources.

If there is no other valid XrTrackableTrackerANDROID that was created with the same XrTrackableTypeANDROID, the runtime **may** disable the tracking services required for that trackable type to save system resources.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to calling xrDestroyTrackableTrackerANDROID
- trackableTracker **must** be a valid XrTrackableTrackerANDROID handle

Thread Safety

- Access to trackableTracker, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

14.11.5. Get all trackables

The XrTrackableANDROID atom is defined as:

```
// Provided by XR_ANDROID_trackables
XR_DEFINE_ATOM(XrTrackableANDROID)
```

XrTrackableANDROID is used to represent a single trackable and is valid only within the lifecycle of its associated XrTrackableTrackerANDROID. The runtime **must** not reuse the same XrTrackableANDROID for different trackables within the same XrTrackableTrackerANDROID.

The xrGetAllTrackablesANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrGetAllTrackablesANDROID(
    XrTrackableTrackerANDROID                   trackableTracker,
    uint32_t                                    trackableCapacityInput,
    uint32_t*                                   trackableCountOutput,
    XrTrackableANDROID*                         trackables);
```

Parameter Descriptions

- `trackableTracker` is the XrTrackableTrackerANDROID to query.
- `trackableCapacityInput` is the capacity of the `trackables` array, or 0 to indicate a request to retrieve the required capacity.
- `trackableCountOutput` is a pointer to the count of `trackables` written, or a pointer to the required capacity in the case that `trackables` is insufficient.
- `trackables` is a pointer to an array of `XrTrackableANDROID`. It **can** be `NULL` if `trackableCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `trackables` size.

xrGetAllTrackablesANDROID fills an array of `XrTrackableANDROID` representing the trackables found in the environment. The XrTrackableTypeANDROID of the returned `trackables` **must** match the XrTrackableTypeANDROID of the `trackableTracker`.

14.11.6. Get trackable plane

The xrGetTrackablePlaneANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrGetTrackablePlaneANDROID(
    XrTrackableTrackerANDROID                   trackableTracker,
    const XrTrackableGetInfoANDROID*            getInfo,
    XrTrackablePlaneANDROID*                    planeOutput);
```

Parameter Descriptions

- `trackableTracker` is the XrTrackableTrackerANDROID to query.
- `getInfo` is the XrTrackableGetInfoANDROID with the information used to get the trackable plane.
- `planeOutput` is a pointer to the XrTrackablePlaneANDROID structure in which the trackable plane is returned.

The xrGetTrackablePlaneANDROID function returns details about the trackable plane — such as its geometry, orientation, and tracking state — at a given point in time.

The plane information returned is a best effort approximation of its state at the given XrTrackableGetInfoANDROID::`time`, relative to the XrTrackableGetInfoANDROID::`baseSpace`.

The runtime **must** return XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID if the trackable type of the XrTrackableGetInfoANDROID::trackable is not XR_TRACKABLE_TYPE_PLANE_ANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to calling xrGetTrackablePlaneANDROID
- trackableTracker **must** be a valid XrTrackableTrackerANDROID handle
- getInfo **must** be a pointer to a valid XrTrackableGetInfoANDROID structure
- planeOutput **must** be a pointer to an XrTrackablePlaneANDROID structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrTrackableGetInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables
typedef struct XrTrackableGetInfoANDROID {
    XrStructureType       type;
    const void*           next;
    XrTrackableANDROID    trackable;
    XrSpace               baseSpace;
    XrTime                time;
} XrTrackableGetInfoANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackable` is the `XrTrackableANDROID` plane to query.
- `baseSpace` the plane pose will be relative to this XrSpace at `time`.
- `time` is the `XrTime` at which to evaluate the coordinates relative to the `baseSpace`.

The XrTrackableGetInfoANDROID structure provides query options when passed to xrGetTrackablePlaneANDROID. The `trackable` **must** correspond to the `trackable` used in xrGetTrackablePlaneANDROID.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables` extension **must** be enabled prior to using XrTrackableGetInfoANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_GET_INFO_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle

The XrTrackablePlaneANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables
typedef struct XrTrackablePlaneANDROID {
    XrStructureType           type;
    void*                     next;
    XrTrackingStateANDROID    trackingState;
    XrPosef                   centerPose;
    XrExtent2Df               extents;
    XrPlaneTypeANDROID        planeType;
    XrPlaneLabelANDROID       planeLabel;
    XrTrackableANDROID        subsumedByPlane;
    XrTime                    lastUpdatedTime;
    uint32_t                  vertexCapacityInput;
    uint32_t*                 vertexCountOutput;
    XrVector2f*               vertices;
} XrTrackablePlaneANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackingState` is the XrTrackingStateANDROID of the plane.
- `centerPose` is an XrPosef defining the position and orientation of the plane within the reference frame of the corresponding XrTrackableGetInfoANDROID::`baseSpace`. An identity orientation here represents a set of axes with +Y parallel to the plane's normal.
- `extents` is the XrExtent2Df dimension of the plane.
- `planeType` is the XrPlaneTypeANDROID that the runtime has determined for this plane.
- `planeLabel` is the XrPlaneLabelANDROID that the runtime has determined for this plane.
- `subsumedByPlane` is the `XrTrackableANDROID` of the plane that subsumes this plane (XR_NULL_TRACKABLE_ANDROID if none exists).
- `lastUpdatedTime` is the `XrTime` of the last update of the plane, meaning any of its properties **may** be different, e.g. `planeLabel`.
- `vertexCapacityInput` is the capacity of the `vertices` array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is the count of `vertices` written, or the required capacity in the case that `vertices` is insufficient.
- `vertices` is a pointer to an array of XrVector2f. It **can** be `NULL` if `vertexCapacityInput` is 0. The vertices are in counter-clockwise order. The polygon **may** be concave and **must** not be self-intersecting.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `vertices` size. However, it is important to note that unlike the "structure form" example given in that section, `vertexCountOutput` is a pointer instead of a value type.

When the runtime has acquired enough environment information to detect that 2 tracked planes are actually the same plane, it **must** set the XrTrackablePlaneANDROID::`subsumedByPlane` of one of the planes to the handle of the other. When this happens, the plane information returned in both of the associated planes **must** be identical. The application **should** stop querying for information about planes that have been reported as subsumed.

Warning

Unlike the typical structure forms used for Buffer Size Parameters, XrTrackablePlaneANDROID ::`vertexCountOutput` is a pointer and not a value type.

Valid Usage (Implicit)

- The XR_ANDROID_trackables extension **must** be enabled prior to using XrTrackablePlaneANDROID
- type **must** be XR_TYPE_TRACKABLE_PLANE_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- trackingState **must** be a valid XrTrackingStateANDROID value
- planeType **must** be a valid XrPlaneTypeANDROID value
- planeLabel **must** be a valid XrPlaneLabelANDROID value
- If vertexCountOutput is not NULL, vertexCountOutput **must** be a pointer to a uint32_t value
- If vertexCapacityInput is not 0, vertices **must** be a pointer to an array of vertexCapacityInput XrVector2f structures

The XrTrackingStateANDROID enum describes the tracking state of an XrTrackableANDROID.

```
// Provided by XR_ANDROID_trackables
typedef enum XrTrackingStateANDROID {
    XR_TRACKING_STATE_PAUSED_ANDROID = 0,
    XR_TRACKING_STATE_STOPPED_ANDROID = 1,
    XR_TRACKING_STATE_TRACKING_ANDROID = 2,
    XR_TRACKING_STATE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrTrackingStateANDROID;
```

Enum	Description
XR_TRACKING_STATE_PAUSED_ANDROID	Indicates that the trackable or anchor tracking is paused but may be resumed in the future.
XR_TRACKING_STATE_STOPPED_ANDROID	Tracking has stopped on this Trackable and will never be resumed.
XR_TRACKING_STATE_TRACKING_ANDROID	The object is currently tracked and its pose is current.

The XrPlaneTypeANDROID enum is the type of an XrTrackableANDROID plane.

```
// Provided by XR_ANDROID_trackables
typedef enum XrPlaneTypeANDROID {
    XR_PLANE_TYPE_HORIZONTAL_DOWNWARD_FACING_ANDROID = 0,
    XR_PLANE_TYPE_HORIZONTAL_UPWARD_FACING_ANDROID = 1,
    XR_PLANE_TYPE_VERTICAL_ANDROID = 2,
    XR_PLANE_TYPE_ARBITRARY_ANDROID = 3,
    XR_PLANE_TYPE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrPlaneTypeANDROID;
```

Enum	Description
XR_PLANE_TYPE_HORIZONTAL_DOWNWARD_FACING_ANDROID	A horizontal plane facing downward (for example a ceiling).
XR_PLANE_TYPE_HORIZONTAL_UPWARD_FACING_ANDROID	A horizontal plane facing upward (for example a floor or tabletop).
XR_PLANE_TYPE_VERTICAL_ANDROID	A vertical plane (for example a wall).
XR_PLANE_TYPE_ARBITRARY_ANDROID	A plane with an arbitrary orientation.

The XrPlaneLabelANDROID enum is a label for an XrTrackableANDROID plane.

```
// Provided by XR_ANDROID_trackables
typedef enum XrPlaneLabelANDROID {
    XR_PLANE_LABEL_UNKNOWN_ANDROID = 0,
    XR_PLANE_LABEL_WALL_ANDROID = 1,
    XR_PLANE_LABEL_FLOOR_ANDROID = 2,
    XR_PLANE_LABEL_CEILING_ANDROID = 3,
    XR_PLANE_LABEL_TABLE_ANDROID = 4,
    XR_PLANE_LABEL_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrPlaneLabelANDROID;
```

Enum	Description
XR_PLANE_LABEL_UNKNOWN_ANDROID	It was not possible to label the plane
XR_PLANE_LABEL_WALL_ANDROID	The plane is a wall.
XR_PLANE_LABEL_FLOOR_ANDROID	The plane is a floor.
XR_PLANE_LABEL_CEILING_ANDROID	The plane is a ceiling.
XR_PLANE_LABEL_TABLE_ANDROID	The plane is a table.

14.11.7. Create anchor space

The xrCreateAnchorSpaceANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables
XrResult xrCreateAnchorSpaceANDROID(
    XrSession                                   session,
    const XrAnchorSpaceCreateInfoANDROID*       createInfo,
    XrSpace*                                    anchorOutput);
```

Parameter Descriptions

- `session` is the XrSession that creates the anchor space.
- `createInfo` is a pointer to an XrAnchorSpaceCreateInfoANDROID structure containing parameters to be used to create the anchor space.
- `anchorOutput` is a pointer to a handle in which the created XrSpace is returned.

At any point in time both the position and direction of the anchor is tracked or untracked together. This means that the runtime **must** either set both `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` and `XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT` or clear both `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` and `XR_SPACE_LOCATION_ORIENTATION_TRACKED_BIT` when the application calls xrLocateSpace or xrLocateSpaces for `anchorOutput`.

The application **must** eventually free the returned XrSpace via xrDestroySpace.

- The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if the runtime does not support anchors.
- The runtime **must** return `XR_ERROR_TRACKABLE_TYPE_NOT_SUPPORTED_ANDROID` if the specific anchor attachment is not supported for the type of the passed XrAnchorSpaceCreateInfoANDROID ::`trackable` as returned by xrEnumerateSupportedAnchorTrackableTypesANDROID.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables` extension **must** be enabled prior to calling xrCreateAnchorSpaceANDROID
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrAnchorSpaceCreateInfoANDROID structure
- `anchorOutput` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_TRACKABLE_TYPE_NOT_SUPPORTED_ANDROID
- XR_ERROR_VALIDATION_FAILURE

The XrAnchorSpaceCreateInfoANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables
typedef struct XrAnchorSpaceCreateInfoANDROID {
    XrStructureType       type;
    const void*           next;
    XrSpace               space;
    XrTime                time;
    XrPosef               pose;
    XrTrackableANDROID    trackable;
} XrAnchorSpaceCreateInfoANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is the XrSpace on which the anchor will be created.
- `time` is the `XrTime` at which `pose` is evaluated in `space`.
- `pose` is the XrPosef of the anchor.
- `trackable` is the `XrTrackableANDROID` on which the anchor will be attached. It **may** be XR_NULL_TRACKABLE_ANDROID to create a spatial anchor.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables` extension **must** be enabled prior to using XrAnchorSpaceCreateInfoANDROID
- `type` **must** be `XR_TYPE_ANCHOR_SPACE_CREATE_INFO_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle

Example code for getting all trackables

The following example code demonstrates how to get all trackables of a given type.

```
XrSession session; // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrCreateTrackableTrackerANDROID xrCreateTrackableTrackerANDROID; // previously
initialized
PFN_xrGetAllTrackablesANDROID xrGetAllTrackablesANDROID; // previously initialized
PFN_xrDestroyTrackableTrackerANDROID xrDestroyTrackableTrackerANDROID; // previously
initialized

XrTrackableTrackerCreateInfoANDROID createInfo{
  .type = XR_TYPE_TRACKABLE_TRACKER_CREATE_INFO_ANDROID,
  .trackableType = XR_TRACKABLE_TYPE_PLANE_ANDROID,
};
XrTrackableTrackerANDROID planeTrackableTracker {XR_NULL_HANDLE};
XrResult result = xrCreateTrackableTrackerANDROID(
  session,
  &createInfo,
```

```
  &planeTrackableTracker);
if (result != XR_SUCCESS) { /* Handle failures. */ }

uint32_t trackableCountOutput = 0;
std::vector<XrTrackableANDROID> allPlaneTrackables;

// Query the number of trackables available.
result = xrGetAllTrackablesANDROID(
  planeTrackableTracker,
  0,
  &trackableCountOutput,
  nullptr
);

if (result == XR_SUCCESS) {
  allPlaneTrackables.resize(trackableCountOutput, XR_NULL_TRACKABLE_ANDROID);

  // Fetch the actual trackable handles in the appropriately resized array.
  result = xrGetAllTrackablesANDROID(
    planeTrackableTracker,
    trackableCountOutput,
    &trackableCountOutput,
    allPlaneTrackables.data());

  if (result == XR_SUCCESS) {
    for (XrTrackableANDROID trackable : allPlaneTrackables) {
      // You now have all trackables of the specified type.
    }
  }
}

// Release trackable tracker.
result = xrDestroyTrackableTrackerANDROID(planeTrackableTracker);
```

Example code for getting trackable plane

The following example code demonstrates how to get a trackable plane from an existing XrTrackableANDROID, obtained from a hit result (XR_ANDROID_raycast) or xrGetAllTrackablesANDROID.

```
XrTrackableTrackerANDROID planeTracker; // previously created

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrGetTrackablePlaneANDROID xrGetTrackablePlaneANDROID; // previously initialized

XrTime updateTime; // Time used for the current frame's simulation update.
XrSpace appSpace; // Space created for XR_REFERENCE_SPACE_TYPE_LOCAL.
XrTrackableANDROID planeTrackable; // Acquired from a hit result or
xrGetAllTrackablesANDROID().

XrTrackableGetInfoANDROID planeGetInfo {
  .type = XR_TYPE_TRACKABLE_GET_INFO_ANDROID,
  .next = nullptr,
  .trackable = planeTrackable,
  .baseSpace = appSpace,
  .time = updateTime,
};

XrTrackablePlaneANDROID plane {
  .type = XR_TYPE_TRACKABLE_PLANE_ANDROID,
};

XrResult result = xrGetTrackablePlaneANDROID(
  planeTracker,
  &planeGetInfo,
  &plane
);

if (result == XR_SUCCESS) {
  // Plane tracking state, center pose, extents, type now available in plane.
}
```

Example code for creating anchor space

The following example code demonstrates how to create an anchor space attached to a trackable.

```
XrSession session; // Created at app startup.
XrTime updateTime; // Time used for the current frame's simulation update.
XrSpace appSpace; // Space created for XR_REFERENCE_SPACE_TYPE_LOCAL.
XrTrackableANDROID planeTrackable; // Acquired from a hit result or
xrGetAllTrackablesANDROID().

PFN_xrCreateAnchorSpaceANDROID xrCreateAnchorSpaceANDROID; // Previously initialized.

// Create an anchor at (2, 2, 2) world-coordinates.
XrAnchorSpaceCreateInfoANDROID spatialAnchorCreateInfo {
```

```
  .type = XR_TYPE_ANCHOR_SPACE_CREATE_INFO_ANDROID,
  .next = nullptr,
  .space = appSpace,
  .time = updateTime,
  .pose = { { 0, 0, 0, 1 }, { 2, 2, 2 } },
};

XrSpace spatialAnchor {XR_NULL_HANDLE};
XrResult result = xrCreateAnchorSpaceANDROID(
  session,
  &spatialAnchorCreateInfo,
  &spatialAnchor
);

// Create an anchor attached to a trackable.
XrTrackablePlaneANDROID plane;
XrAnchorSpaceCreateInfoANDROID trackableAnchorCreateInfo {
  .type = XR_TYPE_ANCHOR_SPACE_CREATE_INFO_ANDROID,
  .next = nullptr,
  .space = appSpace,
  .pose = plane.centerPose,
  .trackable = planeTrackable,
};

XrSpace trackableAnchor = XR_NULL_HANDLE;
result = xrCreateAnchorSpaceANDROID(
  session,
  &trackableAnchorCreateInfo,
  &trackableAnchor
);

while (true) {
  // app update loop
  // ...

  // Get the current location of the anchor's space w.r.t the world.
  XrSpaceLocation anchorLocation {
    .type = XR_TYPE_SPACE_LOCATION,
  };
  result = xrLocateSpace(trackableAnchor, appSpace, updateTime, &anchorLocation);

  if (plane.trackingState == XR_TRACKING_STATE_TRACKING_ANDROID) {
    // Update anchor pose.
    /* doDrawingForAnchor(anchorLocation.pose); */
  } else {
    // ...
  }
```

```
}

// Cleanup - destroy the space, detach the anchor so its no longer tracked by the
// runtime and then release all resources held by it.
xrDestroySpace(spatialAnchor);
xrDestroySpace(trackableAnchor);
```

New Defines

```
// Provided by XR_ANDROID_trackables
#define XR_NULL_TRACKABLE_ANDROID 0
```

XR_NULL_TRACKABLE_ANDROID defines an invalid trackable atom.

14.11.8. New Macros

- XR_NULL_TRACKABLE_ANDROID

14.11.9. New Base Types

- XrTrackableANDROID

14.11.10. New Object Types

- XrTrackableTrackerANDROID

14.11.11. New Commands

14.12.1. Overview

This extension enables physical marker tracking, and enables applications to attach XR content to physical markers in an efficient way.

The extension supports well known marker types, specifically ArUco and April Tags. It enables

runtimes to optionally support marker size estimation.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension depends on `XR_ANDROID_trackables` and exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission i.e. applications **must** explicitly request the permission.

(protection level: dangerous)

14.12.2. Inspect system capability

The XrSystemMarkerTrackingPropertiesANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_marker
typedef struct XrSystemMarkerTrackingPropertiesANDROID {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsMarkerTracking;
    XrBool32           supportsMarkerSizeEstimation;
    uint16_t           maxMarkerCount;
} XrSystemMarkerTrackingPropertiesANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsMarkerTracking` is an `XrBool32` indicating if the current system provides marker tracking capability.
- `supportsMarkerSizeEstimation` is an `XrBool32` indicating if the current system provides marker size estimation.
- `maxMarkerCount` is the maximum number of markers that the runtime is able to track at the same time.

An application **can** inspect whether the system is capable of marker tracking by extending the XrSystemProperties with XrSystemMarkerTrackingPropertiesANDROID structure when calling xrGetSystemProperties. The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` for marker tracker

creation if and only if supportsMarkerTracking is XR_FALSE.

If a runtime supports marker tracking, maxMarkerCount **must** be at least 1.

Valid Usage (Implicit)

- The XR_ANDROID_trackables_marker extension **must** be enabled prior to using XrSystemMarkerTrackingPropertiesANDROID
- type **must** be XR_TYPE_SYSTEM_MARKER_TRACKING_PROPERTIES_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain

14.12.3. Tracking markers

This extension adds XR_TRACKABLE_TYPE_MARKER_ANDROID to XrTrackableTypeANDROID.

The application creates an XrTrackableTrackerANDROID by calling xrCreateTrackableTrackerANDROID and specifying XR_TRACKABLE_TYPE_MARKER_ANDROID as the trackable type in XrTrackableTrackerCreateInfoANDROID::trackableType as well as setting a setting a valid configuration by adding a XrTrackableMarkerConfigurationANDROID to the next chain of XrTrackableTrackerCreateInfoANDROID.

The runtime **must** return XR_ERROR_FEATURE_UNSUPPORTED if XrTrackableTrackerCreateInfoANDROID::trackableType is XR_TRACKABLE_TYPE_MARKER_ANDROID and XrSystemMarkerTrackingPropertiesANDROID::supportsMarkerTracking returns XR_FALSE via xrGetSystemProperties.

The XrTrackableMarkerConfigurationANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_marker
typedef struct XrTrackableMarkerConfigurationANDROID {
    XrStructureType                           type;
    void*                                     next;
    XrTrackableMarkerTrackingModeANDROID      trackingMode;
    uint32_t                                  databaseCount;
    const XrTrackableMarkerDatabaseANDROID*   databases;
} XrTrackableMarkerConfigurationANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `trackingMode` is an XrTrackableMarkerTrackingModeANDROID indicating the desired mode for tracking.
- `databaseCount` is a `uint32_t` describing the count of elements in the `databases` array.
- `databases` is a pointer to an array of XrTrackableMarkerDatabaseANDROID, each of which contains the desired markers from a given dictionary to track.

The application **must** set a valid configuration by adding a XrTrackableMarkerConfigurationANDROID to the XrTrackableTrackerCreateInfoANDROID::`next` chain when calling xrCreateTrackableTrackerANDROID with XrTrackableTrackerCreateInfoANDROID::`trackableType` set to `XR_TRACKABLE_TYPE_MARKER_ANDROID`. Otherwise, if the tracker type is set as above but the configuration structure is not present or not valid, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If a runtime supports marker size estimation, the application **can** set XrTrackableMarkerDatabaseEntryANDROID::`edgeSize` to `0` in XrTrackableMarkerDatabaseANDROID::`entries` to indicate the usage of size estimation. Otherwise, the application **must** set XrTrackableMarkerDatabaseEntryANDROID::`edgeSize` to a positive value or the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The runtime **must** filter the output from xrGetAllTrackablesANDROID to match the `trackingMode` and XrTrackableMarkerDatabaseEntryANDROID::`edgeSize`.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_marker` extension **must** be enabled prior to using XrTrackableMarkerConfigurationANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_MARKER_CONFIGURATION_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `trackingMode` **must** be a valid XrTrackableMarkerTrackingModeANDROID value
- `databases` **must** be a pointer to an array of `databaseCount` valid XrTrackableMarkerDatabaseANDROID structures
- The `databaseCount` parameter **must** be greater than `0`

The XrTrackableMarkerTrackingModeANDROID enum describes the supported tracking modes of markers.

```
// Provided by XR_ANDROID_trackables_marker
typedef enum XrTrackableMarkerTrackingModeANDROID {
    XR_TRACKABLE_MARKER_TRACKING_MODE_DYNAMIC_ANDROID = 0,
    XR_TRACKABLE_MARKER_TRACKING_MODE_STATIC_ANDROID = 1,
    XR_TRACKABLE_MARKER_TRACKING_MODE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrTrackableMarkerTrackingModeANDROID;
```

Enumerant Descriptions

- XR_TRACKABLE_MARKER_TRACKING_MODE_DYNAMIC_ANDROID — Tracking dynamic markers. This mode has the highest accuracy and works on moving and static markers, but also has the highest power consumption.
- XR_TRACKABLE_MARKER_TRACKING_MODE_STATIC_ANDROID — Tracking static markers. This mode is primarily useful for markers that are known to be static, which leads to less power consumption in comparison to the dynamic mode.

The XrTrackableMarkerDatabaseANDROID structure defines a dictionary and corresponding marker ids to be tracked.

```
// Provided by XR_ANDROID_trackables_marker
typedef struct XrTrackableMarkerDatabaseANDROID {
    XrTrackableMarkerDictionaryANDROID              dictionary;
    uint32_t                                        entryCount;
    const XrTrackableMarkerDatabaseEntryANDROID*    entries;
} XrTrackableMarkerDatabaseANDROID;
```

Member Descriptions

- dictionary is the XrTrackableMarkerDictionaryANDROID that all entries belong to.
- entryCount is a uint32_t describing the count of elements in the entries array. The application **can** set entryCount 0 to track all markers in the dictionary.
- entries is a pointer to an array of XrTrackableMarkerDatabaseEntryANDROID, each of which contains the configuration of a marker to track.

Valid Usage (Implicit)

- The XR_ANDROID_trackables_marker extension **must** be enabled prior to using XrTrackableMarkerDatabaseANDROID
- dictionary **must** be a valid XrTrackableMarkerDictionaryANDROID value
- If entryCount is not 0, entries **must** be a pointer to an array of entryCount XrTrackableMarkerDatabaseEntryANDROID structures

The XrTrackableMarkerDictionaryANDROID enum describes the supported marker dictionaries.

```
// Provided by XR_ANDROID_trackables_marker
typedef enum XrTrackableMarkerDictionaryANDROID {
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_4X4_50_ANDROID = 0,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_4X4_100_ANDROID = 1,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_4X4_250_ANDROID = 2,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_4X4_1000_ANDROID = 3,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_5X5_50_ANDROID = 4,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_5X5_100_ANDROID = 5,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_5X5_250_ANDROID = 6,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_5X5_1000_ANDROID = 7,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_6X6_50_ANDROID = 8,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_6X6_100_ANDROID = 9,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_6X6_250_ANDROID = 10,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_6X6_1000_ANDROID = 11,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_7X7_50_ANDROID = 12,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_7X7_100_ANDROID = 13,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_7X7_250_ANDROID = 14,
    XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_7X7_1000_ANDROID = 15,
    XR_TRACKABLE_MARKER_DICTIONARY_APRILTAG_16H5_ANDROID = 16,
    XR_TRACKABLE_MARKER_DICTIONARY_APRILTAG_25H9_ANDROID = 17,
    XR_TRACKABLE_MARKER_DICTIONARY_APRILTAG_36H10_ANDROID = 18,
    XR_TRACKABLE_MARKER_DICTIONARY_APRILTAG_36H11_ANDROID = 19,
    XR_TRACKABLE_MARKER_DICTIONARY_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrTrackableMarkerDictionaryANDROID;
```

The XrTrackableMarkerDatabaseEntryANDROID structure configures a single marker id of a dictionary.

```
// Provided by XR_ANDROID_trackables_marker
typedef struct XrTrackableMarkerDatabaseEntryANDROID {
    int32_t    id;
    float      edgeSize;
} XrTrackableMarkerDatabaseEntryANDROID;
```

Member Descriptions

- `id` is the marker id as given in the dictionary.
- `edgeSize` represents the size of marker edge in meters. If the runtime supports marker size estimation, the application **can** set this to zero and the marker size will be estimated online. If this is set to zero but the runtime does not support marker size estimation, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_marker` extension **must** be enabled prior to using XrTrackableMarkerDatabaseEntryANDROID

14.12.4. Get markers

The xrGetTrackableMarkerANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables_marker
XrResult xrGetTrackableMarkerANDROID(
    XrTrackableTrackerANDROID                   tracker,
    const XrTrackableGetInfoANDROID*            getInfo,
    XrTrackableMarkerANDROID*                   markerOutput);
```

Parameter Descriptions

- `tracker` is the XrTrackableTrackerANDROID to query.
- `getInfo` is the XrTrackableGetInfoANDROID with the information used to get the trackable marker.
- `markerOutput` is a pointer to the XrTrackableMarkerANDROID structure in which the trackable marker is returned.

The runtime **must** return `XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID` if the trackable type of the

XrTrackableANDROID is not XR_TRACKABLE_TYPE_MARKER_ANDROID, or if the trackable type of the XrTrackableTrackerANDROID is not XR_TRACKABLE_TYPE_MARKER_ANDROID.

Valid Usage (Implicit)

- The XR_ANDROID_trackables_marker extension **must** be enabled prior to calling xrGetTrackableMarkerANDROID
- `tracker` **must** be a valid XrTrackableTrackerANDROID handle
- `getInfo` **must** be a pointer to a valid XrTrackableGetInfoANDROID structure
- `markerOutput` **must** be a pointer to an XrTrackableMarkerANDROID structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrTrackableMarkerANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_marker
typedef struct XrTrackableMarkerANDROID {
    XrStructureType                         type;
    void*                                   next;
    XrTrackingStateANDROID                  trackingState;
    XrTime                                  lastUpdatedTime;
    XrTrackableMarkerDictionaryANDROID      dictionary;
    int32_t                                 markerId;
    XrPosef                                 centerPose;
    XrExtent2Df                             extents;
} XrTrackableMarkerANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackingState` is the XrTrackingStateANDROID of the marker.
- `lastUpdatedTime` is the `XrTime` of the last update of the marker.
- `dictionary` is the XrTrackableMarkerDictionaryANDROID of the marker.
- `markerId` is the marker id as given in the dictionary.
- `centerPose` is the XrPosef of the marker located in XrTrackableGetInfoANDROID::`baseSpace`. The marker lies in the XZ plane with X pointing to the right of the marker and Z pointing to its bottom and Y coming out of the marker as the normal.
- `extents` is the XrExtent2Df dimensions of the marker. The boundary of the bounding box is at points: `centerPose` +/- (`extents` / 2).

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_marker` extension **must** be enabled prior to using XrTrackableMarkerANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_MARKER_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `trackingState` **must** be a valid XrTrackingStateANDROID value
- `dictionary` **must** be a valid XrTrackableMarkerDictionaryANDROID value

14.12.5. Example code for getting trackable markers

The following example code demonstrates how to get trackable markers.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrGetSystemProperties xrGetSystemProperties;                      // previously
initialized
PFN_xrCreateTrackableTrackerANDROID xrCreateTrackableTrackerANDROID;   // previously
initialized
PFN_xrGetAllTrackablesANDROID xrGetAllTrackablesANDROID;              // previously
initialized
PFN_xrGetTrackableMarkerANDROID xrGetTrackableMarkerANDROID;          // previously
initialized
PFN_xrDestroyTrackableTrackerANDROID xrDestroyTrackableTrackerANDROID; // previously
initialized

XrTime updateTime; // Time used for the current frame's simulation update.
XrSpace appSpace;  // Space created for XR_REFERENCE_SPACE_TYPE_LOCAL.

// Inspect system capability
XrSystemMarkerTrackingPropertiesANDROID markerProperty {
  .type = XR_TYPE_SYSTEM_MARKER_TRACKING_PROPERTIES_ANDROID,
  .next = nullptr,
};
XrSystemProperties systemProperties {
  .type = XR_TYPE_SYSTEM_PROPERTIES,
  .next = &markerProperty,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!markerProperty.supportsMarkerTracking) {
    // Marker tracking is not supported.
    return;
}

// Create a trackable tracker for marker tracking.
// If the runtime does not support size estimation, configures marker edge size of 0.1m.
XrTrackableMarkerDatabaseEntryANDROID markerEntries {
  .id = 0,
  .edgeSize = markerProperty.supportsMarkerSizeEstimation ? 0.0f : 0.1f,
};
XrTrackableMarkerDatabaseANDROID markerDatabases {
  .dictionary = XR_TRACKABLE_MARKER_DICTIONARY_ARUCO_4X4_50_ANDROID,
  .entryCount = 1,
```

```
  .entries = &markerEntries,
};
XrTrackableMarkerConfigurationANDROID configuration {
  .type = XR_TYPE_TRACKABLE_MARKER_CONFIGURATION_ANDROID,
  .next = nullptr,
  .trackingMode = XR_TRACKABLE_MARKER_TRACKING_MODE_DYNAMIC_ANDROID,
  .databaseCount = 1,
  .databases = &markerDatabases,
};
XrTrackableTrackerCreateInfoANDROID createInfo {
  .type = XR_TYPE_TRACKABLE_TRACKER_CREATE_INFO_ANDROID,
  .next = &configuration,
  .trackableType = XR_TRACKABLE_TYPE_MARKER_ANDROID,
};
XrTrackableTrackerANDROID markerTracker;
auto res = xrCreateTrackableTrackerANDROID(session, &createInfo, &markerTracker);
if (res == XR_ERROR_PERMISSION_INSUFFICIENT) {
    // Handle permission requests.
}
CHK_XR(res);

// Get markers.
std::vector<XrTrackableANDROID> trackables(markerProperty.maxMarkerCount);
std::vector<XrTrackableMarkerANDROID> markers(markerProperty.maxMarkerCount, {
  .type = XR_TYPE_TRACKABLE_MARKER_ANDROID,
  .next = nullptr,
});
uint32_t markerSize = 0;
CHK_XR(xrGetAllTrackablesANDROID(markerTracker, markerProperty.maxMarkerCount,
&markerSize,
                                 trackables.data()));
for (int i = 0; i < markerSize; i++) {
    XrTrackableGetInfoANDROID getInfo {
      .type = XR_TYPE_TRACKABLE_GET_INFO_ANDROID,
      .next = nullptr,
      .trackable = trackables[i],
      .baseSpace = appSpace,
      .time = updateTime,
    };
    CHK_XR(xrGetTrackableMarkerANDROID(markerTracker, &getInfo, &markers[i]));
    // Handle markers.
}

// Release trackable tracker.
CHK_XR(xrDestroyTrackableTrackerANDROID(markerTracker));
```

14.12.6. New Commands

- xrGetTrackableMarkerANDROID

14.12.7. New Structures

- XrTrackableMarkerANDROID
- XrTrackableMarkerDatabaseANDROID
- XrTrackableMarkerDatabaseEntryANDROID
- Extending XrSystemProperties:
  - XrSystemMarkerTrackingPropertiesANDROID
- Extending XrTrackableTrackerCreateInfoANDROID:
  - XrTrackableMarkerConfigurationANDROID

14.12.8. New Enums

- XrTrackableMarkerDictionaryANDROID
- XrTrackableMarkerTrackingModeANDROID

14.12.9. New Enum Constants

- `XR_ANDROID_TRACKABLES_MARKER_EXTENSION_NAME`
- `XR_ANDROID_trackables_marker_SPEC_VERSION`
- Extending XrStructureType:
  - `XR_TYPE_SYSTEM_MARKER_TRACKING_PROPERTIES_ANDROID`
  - `XR_TYPE_TRACKABLE_MARKER_ANDROID`
  - `XR_TYPE_TRACKABLE_MARKER_CONFIGURATION_ANDROID`
- Extending XrTrackableTypeANDROID:
  - `XR_TRACKABLE_TYPE_MARKER_ANDROID`

14.12.10. Issues

14.12.11. Version History

14.13.1. Overview

This extension enables physical object tracking such as keyboards, mice, and other objects in the environment.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension depends on XR_ANDROID_trackables and exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission.

(protection level: dangerous)

14.13.2. Tracking objects

To track objects, the application creates an XrTrackableTrackerANDROID by calling xrCreateTrackableTrackerANDROID and specifying the XR_TRACKABLE_TYPE_OBJECT_ANDROID enumerant added to XrTrackableTypeANDROID by this extension as the trackable type in XrTrackableTrackerCreateInfoANDROID::trackableType.

The XrTrackableObjectConfigurationANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_object
typedef struct XrTrackableObjectConfigurationANDROID {
    XrStructureType                type;
    void*                          next;
    uint32_t                       labelCount;
    const XrObjectLabelANDROID*    activeLabels;
} XrTrackableObjectConfigurationANDROID;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- labelCount is the count of activeLabels.
- activeLabels is a pointer to the array of XrObjectLabelANDROID indicating the active objects in tracking.

- The application **can** configure the XrTrackableTrackerANDROID to track only a subset of supported objects by adding a XrTrackableObjectConfigurationANDROID structure to the XrTrackableTrackerCreateInfoANDROID::next chain.
- The runtime **must** filter the output from xrGetAllTrackablesANDROID to match any of the activeLabels.

If the application does not add XrTrackableObjectConfigurationANDROID to the XrTrackableTrackerCreateInfoANDROID::next chain, the runtime **must** track all objects that the system has identified.

Valid Usage (Implicit)

- The XR_ANDROID_trackables_object extension **must** be enabled prior to using XrTrackableObjectConfigurationANDROID
- type **must** be XR_TYPE_TRACKABLE_OBJECT_CONFIGURATION_ANDROID
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- activeLabels **must** be a pointer to an array of labelCount valid XrObjectLabelANDROID values
- The labelCount parameter **must** be greater than 0

The XrObjectLabelANDROID enum describes the type of object that the system has identified.

```
// Provided by XR_ANDROID_trackables_object
typedef enum XrObjectLabelANDROID {
    XR_OBJECT_LABEL_UNKNOWN_ANDROID = 0,
    XR_OBJECT_LABEL_KEYBOARD_ANDROID = 1,
    XR_OBJECT_LABEL_MOUSE_ANDROID = 2,
    XR_OBJECT_LABEL_LAPTOP_ANDROID = 3,
    XR_OBJECT_LABEL_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrObjectLabelANDROID;
```

14.13.3. Get trackable object

The xrGetTrackableObjectANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables_object
XrResult xrGetTrackableObjectANDROID(
    XrTrackableTrackerANDROID                   tracker,
    const XrTrackableGetInfoANDROID*            getInfo,
    XrTrackableObjectANDROID*                   objectOutput);
```

Parameter Descriptions

- `tracker` is the XrTrackableTrackerANDROID to query.
- `getInfo` is the XrTrackableGetInfoANDROID with the information used to get the trackable object.
- `objectOutput` is a pointer to the XrTrackableObjectANDROID structure in which the trackable object is returned.

The runtime **must** return `XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID` if the trackable type of the `XrTrackableANDROID` is not `XR_TRACKABLE_TYPE_OBJECT_ANDROID`, or if the trackable type of the XrTrackableTrackerANDROID is not `XR_TRACKABLE_TYPE_OBJECT_ANDROID`.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_object` extension **must** be enabled prior to calling xrGetTrackableObjectANDROID
- `tracker` **must** be a valid XrTrackableTrackerANDROID handle
- `getInfo` **must** be a pointer to a valid XrTrackableGetInfoANDROID structure
- `objectOutput` **must** be a pointer to an XrTrackableObjectANDROID structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SESSION_NOT_RUNNING`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

The XrTrackableObjectANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_object
typedef struct XrTrackableObjectANDROID {
    XrStructureType           type;
    void*                     next;
    XrTrackingStateANDROID    trackingState;
    XrPosef                   centerPose;
    XrExtent3DfEXT            extents;
    XrObjectLabelANDROID      objectLabel;
    XrTime                    lastUpdatedTime;
} XrTrackableObjectANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackingState` is the XrTrackingStateANDROID of the object.
- `centerPose` is the XrPosef of the object located in XrTrackableGetInfoANDROID::`baseSpace`.
- `extents` is the XrExtent3DfEXT dimension of the object.
- `objectLabel` is the XrObjectLabelANDROID that the runtime has determined for this object.
- `lastUpdatedTime` is the `XrTime` of the last update of the object.

The runtime **must** only return objects that it successfully identified. I.e. XrTrackableObjectANDROID ::`objectLabel` **must** not be `XR_OBJECT_LABEL_UNKNOWN_ANDROID`.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_object` extension **must** be enabled prior to using XrTrackableObjectANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_OBJECT_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `trackingState` **must** be a valid XrTrackingStateANDROID value
- `objectLabel` **must** be a valid XrObjectLabelANDROID value

14.13.4. Trackable object orientation

The orientation of the objects is shown in the following image (with xyz = rgb) originating at the centroid of the objects.

The 3D orientation of the mouse is aligned to the 3D orientation of the supporting plane. The extents enclose the keyboard and mouse completely and the base of the laptop.

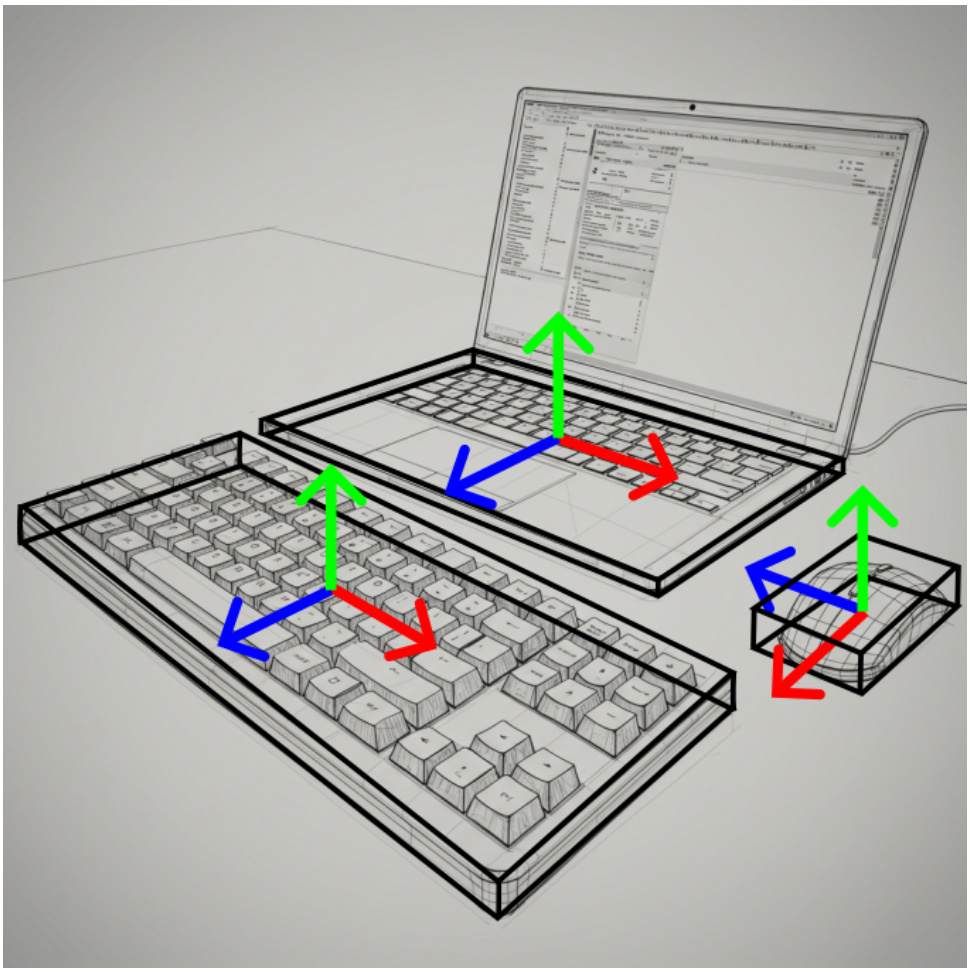

Figure 40. Example object orientation.

14.13.5. Example code for getting trackable objects

The following example code demonstrates how to get trackable objects.

```
XrSession session; // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrCreateTrackableTrackerANDROID xrCreateTrackableTrackerANDROID; // previously
initialized
PFN_xrGetAllTrackablesANDROID xrGetAllTrackablesANDROID; // previously initialized
PFN_xrGetTrackableObjectANDROID xrGetTrackableObjectANDROID; // previously initialized
PFN_xrDestroyTrackableTrackerANDROID xrDestroyTrackableTrackerANDROID; // previously
```

```
initialized

XrTime updateTime; // Time used for the current frame's simulation update.
XrSpace appSpace; // Space created for XR_REFERENCE_SPACE_TYPE_LOCAL.

XrTrackableTrackerCreateInfoANDROID createInfo {
  .type = XR_TYPE_TRACKABLE_TRACKER_CREATE_INFO_ANDROID,
  .trackableType = XR_TRACKABLE_TYPE_OBJECT_ANDROID,
};
XrTrackableTrackerANDROID objectTrackableTracker;
XrResult result = xrCreateTrackableTrackerANDROID(
  session,
  &createInfo,
  &objectTrackableTracker);
if (result != XR_SUCCESS) { /* Handle failures. */ }

uint32_t trackableCountOutput = 0;
std::vector<XrTrackableANDROID> allObjectTrackables;

// Query the number of trackables available.
result = xrGetAllTrackablesANDROID(
  objectTrackableTracker,
  0,
  &trackableCountOutput,
  nullptr
);

if (result == XR_SUCCESS) {
  allObjectTrackables.resize(trackableCountOutput, XR_NULL_TRACKABLE_ANDROID);

  // Fetch the actual trackable handles in the appropriately resized array.
  result = xrGetAllTrackablesANDROID(
    objectTrackableTracker,
    trackableCountOutput,
    &trackableCountOutput,
    allObjectTrackables.data());

  if (result == XR_SUCCESS) {
    for (XrTrackableANDROID trackable : allObjectTrackables) {

      // Object trackable query information
      XrTrackableGetInfoANDROID objectGetInfo {
        .type = XR_TYPE_TRACKABLE_GET_INFO_ANDROID,
        .next = nullptr,
        .trackable = trackable,
        .baseSpace = appSpace,
        .time = updateTime,
      };
```

```
      // Get the object trackable. Note that the tracker only returns object types.
      XrTrackableObjectANDROID object = { XR_TYPE_TRACKABLE_OBJECT_ANDROID };
      result = xrGetTrackableObjectANDROID(
        objectTrackableTracker,
        &objectGetInfo,
        &object
      );

      if (result == XR_SUCCESS) {
        /** Do Stuff with the object */
      }
    }
  }
}

// Release trackable tracker.
result = xrDestroyTrackableTrackerANDROID(objectTrackableTracker);
```

14.14.1. Overview

This extension enables physical QR code tracking and QR code data decoding.

Permissions

Android applications **must** have the android.permission.SCENE_UNDERSTANDING_COARSE permission listed in their manifest as this extension depends on `XR_ANDROID_trackables` and exposes the geometry of the environment. The android.permission.SCENE_UNDERSTANDING_COARSE permission is considered a dangerous permission.

(protection level: dangerous)

14.14.2. Inspect system capability

The XrSystemQrCodeTrackingPropertiesANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_qr_code
typedef struct XrSystemQrCodeTrackingPropertiesANDROID {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsQrCodeTracking;
    XrBool32           supportsQrCodeSizeEstimation;
    uint16_t           maxQrCodeCount;
} XrSystemQrCodeTrackingPropertiesANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `supportsQrCodeTracking` is an `XrBool32` indicating if current system provides QR code tracking capability.
- `supportsQrCodeSizeEstimation` is an `XrBool32` indicating if current system provides QR code size estimation.
- `maxQrCodeCount` is the total maximum number of QR codes that **can** be tracked at the same time.

An application **can** inspect whether the system is capable of QR code tracking by extending the XrSystemProperties with XrSystemQrCodeTrackingPropertiesANDROID structure when calling xrGetSystemProperties. The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` for QR code tracker creation if and only if `supportsQrCodeTracking` is `XR_FALSE`.

If a runtime supports QR code tracking, `maxQrCodeCount` **must** be at least 1. If a runtime does not support QR code tracking, `maxQrCodeCount` **must** be 0.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_qr_code` extension **must** be enabled prior to using XrSystemQrCodeTrackingPropertiesANDROID
- `type` **must** be `XR_TYPE_SYSTEM_QR_CODE_TRACKING_PROPERTIES_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

14.14.3. Tracking QR codes

This extension adds `XR_TRACKABLE_TYPE_QR_CODE_ANDROID` to XrTrackableTypeANDROID.

The application **may** create an XrTrackableTrackerANDROID by calling xrCreateTrackableTrackerANDROID and specifying `XR_TRACKABLE_TYPE_QR_CODE_ANDROID` as the trackable type in XrTrackableTrackerCreateInfoANDROID::`trackableType` to track QR codes.

The runtime **must** return `XR_ERROR_FEATURE_UNSUPPORTED` if XrTrackableTrackerCreateInfoANDROID::`trackableType` is `XR_TRACKABLE_TYPE_QR_CODE_ANDROID` and XrSystemQrCodeTrackingPropertiesANDROID::`supportsQrCodeTracking` returns `XR_FALSE` via xrGetSystemProperties.

The XrTrackableQrCodeConfigurationANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_qr_code
typedef struct XrTrackableQrCodeConfigurationANDROID {
    XrStructureType                type;
    void*                          next;
    XrQrCodeTrackingModeANDROID    trackingMode;
    float                          qrCodeEdgeSize;
} XrTrackableQrCodeConfigurationANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackingMode` is an XrQrCodeTrackingModeANDROID indicating the desired mode for tracking.
- `qrCodeEdgeSize` indicates the size of the QR code edge in meters. If zero, the runtime estimates the QR code size online.

The application **must** set a valid configuration by adding a XrTrackableQrCodeConfigurationANDROID to the next chain of XrTrackableTrackerCreateInfoANDROID. Otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If the runtime supports QR code size estimation, the application **may** set XrTrackableQrCodeConfigurationANDROID::`qrCodeEdgeSize` to `0.0` to indicate the usage of size estimation.

If the runtime does not support QR code size estimation, the application **must** set XrTrackableQrCodeConfigurationANDROID::`qrCodeEdgeSize` to a positive value, otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

The runtime **must** filter the output from xrGetAllTrackablesANDROID to match the `trackingMode`. If XrTrackableQrCodeConfigurationANDROID::`qrCodeEdgeSize` is not set to `0.0` the runtime **must** only return QR codes that match this size. If XrTrackableQrCodeConfigurationANDROID::`qrCodeEdgeSize` is set to `0.0` the runtime **must** return all QR codes with estimated size.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_qr_code` extension **must** be enabled prior to using XrTrackableQrCodeConfigurationANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_QR_CODE_CONFIGURATION_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `trackingMode` **must** be a valid XrQrCodeTrackingModeANDROID value

The XrQrCodeTrackingModeANDROID enum describes the supported tracking modes of QR codes.

```
// Provided by XR_ANDROID_trackables_qr_code
typedef enum XrQrCodeTrackingModeANDROID {
    XR_QR_CODE_TRACKING_MODE_DYNAMIC_ANDROID = 0,
    XR_QR_CODE_TRACKING_MODE_STATIC_ANDROID = 1,
    XR_QR_CODE_TRACKING_MODE_MAX_ENUM_ANDROID = 0x7FFFFFFF
} XrQrCodeTrackingModeANDROID;
```

Enumerant Descriptions

- `XR_QR_CODE_TRACKING_MODE_DYNAMIC_ANDROID` — Tracking dynamic QR codes. This mode has the highest accuracy and works on moving and static QR codes, but also has the highest power consumption.
- `XR_QR_CODE_TRACKING_MODE_STATIC_ANDROID` — Tracking static QR codes. This mode is primarily useful for QR codes that are known to be static, which leads to less power consumption in comparison to the dynamic mode.

14.14.4. Get QR codes

The xrGetTrackableQrCodeANDROID function is defined as:

```
// Provided by XR_ANDROID_trackables_qr_code
XrResult xrGetTrackableQrCodeANDROID(
    XrTrackableTrackerANDROID                   tracker,
    const XrTrackableGetInfoANDROID*            getInfo,
    XrTrackableQrCodeANDROID*                   qrCodeOutput);
```

Parameter Descriptions

- `tracker` is the XrTrackableTrackerANDROID to query.
- `getInfo` is the XrTrackableGetInfoANDROID with the information used to get the trackable QR code.
- `qrCodeOutput` is a pointer to the XrTrackableQrCodeANDROID structure in which the trackable QR code is returned.

The runtime **must** return `XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID` if the trackable type of the `XrTrackableANDROID` is not `XR_TRACKABLE_TYPE_QR_CODE_ANDROID`, or if the trackable type of the XrTrackableTrackerANDROID is not `XR_TRACKABLE_TYPE_QR_CODE_ANDROID`.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_qr_code` extension **must** be enabled prior to calling xrGetTrackableQrCodeANDROID
- `tracker` **must** be a valid XrTrackableTrackerANDROID handle
- `getInfo` **must** be a pointer to a valid XrTrackableGetInfoANDROID structure
- `qrCodeOutput` **must** be a pointer to an XrTrackableQrCodeANDROID structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_MISMATCHING_TRACKABLE_TYPE_ANDROID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrTrackableQrCodeANDROID structure is defined as:

```
// Provided by XR_ANDROID_trackables_qr_code
typedef struct XrTrackableQrCodeANDROID {
    XrStructureType           type;
    void*                     next;
    XrTrackingStateANDROID    trackingState;
    XrTime                    lastUpdatedTime;
    XrPosef                   centerPose;
    XrExtent2Df               extents;
    uint32_t                  bufferCapacityInput;
    uint32_t                  bufferCountOutput;
    char*                     buffer;
} XrTrackableQrCodeANDROID;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `trackingState` is the XrTrackingStateANDROID of the QR code.
- `lastUpdatedTime` is the `XrTime` of the last update of the QR code. If `lastUpdatedTime` is changed from the last call, all other fields **may** have changed.
- `centerPose` is the XrPosef of the QR code located in XrTrackableGetInfoANDROID::`baseSpace`. The QR code lies in the XZ plane with X pointing to the right of the QR code, Z pointing to its bottom and Y coming out of the QR code as the normal.
- `extents` is the XrExtent2Df dimensions of the QR code. The boundary of the bounding box is at points: `centerPose` +/- (`extents` / 2).
- `bufferCapacityInput` is the capability of the `buffer`, or `0` to retrieve the required capability.
- `bufferCountOutput` If the `bufferCapacityInput` is `0`, the runtime will write the required buffer size into `bufferCountOutput`. Otherwise, it contains the total elements written in `buffer`. If the QR code data has not been decoded yet, the runtime **must** set bufferCountOutput to 0.
- `buffer` is a pointer to an array of `char` to write the decoded QR code data. If the application does not care about the decoded QR code data it **can** pass `nullptr` and omit the second two-call call. The QR code data is returned as null-terminated UTF-8 string.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

Valid Usage (Implicit)

- The `XR_ANDROID_trackables_qr_code` extension **must** be enabled prior to using XrTrackableQrCodeANDROID
- `type` **must** be `XR_TYPE_TRACKABLE_QR_CODE_ANDROID`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `trackingState` **must** be a valid XrTrackingStateANDROID value
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` char values

14.14.5. Example code for getting trackable QR codes

The following example code demonstrates how to get trackable QR codes.

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// The function pointers are previously initialized using xrGetInstanceProcAddr.
PFN_xrGetSystemProperties xrGetSystemProperties;                      // previously
initialized
PFN_xrCreateTrackableTrackerANDROID xrCreateTrackableTrackerANDROID;   // previously
initialized
PFN_xrGetAllTrackablesANDROID xrGetAllTrackablesANDROID;               // previously
initialized
PFN_xrGetTrackableQrCodeANDROID xrGetTrackableQrCodeANDROID;           // previously
initialized
PFN_xrDestroyTrackableTrackerANDROID xrDestroyTrackableTrackerANDROID; // previously
initialized

XrTime updateTime; // Time used for the current frame's simulation update.
XrSpace appSpace;  // Space created for XR_REFERENCE_SPACE_TYPE_LOCAL.

// Inspect system capability
XrSystemQrCodeTrackingPropertiesANDROID qrCodeProperty {
  .type = XR_TYPE_SYSTEM_QR_CODE_TRACKING_PROPERTIES_ANDROID,
  .next = nullptr,
};
XrSystemProperties systemProperties {
  .type = XR_TYPE_SYSTEM_PROPERTIES,
  .next = &qrCodeProperty,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!qrCodeProperty.supportsQrCodeTracking) {
    // QR code tracking is not supported.
    return;
}

// Create a trackable tracker for QR code tracking.
// If the runtime does not support size estimation, configures QR code edge size of 0.1m.
XrTrackableQrCodeConfigurationANDROID configuration {
  .type = XR_TYPE_TRACKABLE_QR_CODE_CONFIGURATION_ANDROID,
  .next = nullptr,
  .trackingMode = XR_QR_CODE_TRACKING_MODE_DYNAMIC_ANDROID,
  .qrCodeEdgeSize = qrCodeProperty.supportsQrCodeSizeEstimation ? 0.0f : 0.1f,
};
XrTrackableTrackerCreateInfoANDROID createInfo {
  .type = XR_TYPE_TRACKABLE_TRACKER_CREATE_INFO_ANDROID,
  .next = &configuration,
  .trackableType = XR_TRACKABLE_TYPE_QR_CODE_ANDROID
};
XrTrackableTrackerANDROID qrCodeTracker;
```

```
auto res = xrCreateTrackableTrackerANDROID(session, &createInfo, &qrCodeTracker);
if (res == XR_ERROR_PERMISSION_INSUFFICIENT) {
    // Handle permission requests.
}
CHK_XR(res);

// Get QR codes.
std::vector<XrTrackableANDROID> trackables(qrCodeProperty.maxQrCodeCount);
std::vector<XrTrackableQrCodeANDROID> qrCodes(qrCodeProperty.maxQrCodeCount, {
  .type = XR_TYPE_TRACKABLE_QR_CODE_ANDROID,
  .next = nullptr,
  .bufferCountOutput = 0,
});
uint32_t qrCodeSize = 0;
CHK_XR(xrGetAllTrackablesANDROID(qrCodeTracker, qrCodeProperty.maxQrCodeCount,
&qrCodeSize,
                                 trackables.data()));
for (int i = 0; i < qrCodeSize; i++) {
    XrTrackableGetInfoANDROID getInfo {
      .type = XR_TYPE_TRACKABLE_GET_INFO_ANDROID,
      .next = nullptr,
      .trackable = trackables.at(i),
      .baseSpace = appSpace,
      .time = updateTime,
    };
    CHK_XR(xrGetTrackableQrCodeANDROID(qrCodeTracker, &getInfo, &qrCodes[i]));
    if (qrCodes[i].bufferCountOutput > 0) {
        // Allocate the buffer if it is not already allocated.
        if (qrCodes[i].bufferCapacityInput == 0) {
            qrCodes[i].buffer = new char[qrCodes[i].bufferCountOutput];
            qrCodes[i].bufferCapacityInput = qrCodes[i].bufferCountOutput;
            CHK_XR(xrGetTrackableQrCodeANDROID(qrCodeTracker, &getInfo, &qrCodes[i]));
        }
    }
}

// Release trackable tracker.
CHK_XR(xrDestroyTrackableTrackerANDROID(qrCodeTracker));
```

Overview

This extension defines the interaction profile for PICO Neo3, PICO 4, and PICO G3 Controllers.

BD(ByteDance) Controller interaction profile

Interaction profile path for PICO Neo3:

- */interaction_profiles/bytedance/pico_neo3_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/bytedance/pico_neo3_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/bytedance/pico_neo3_controller_bd*, to allow for modifications when promoted to a KHR extension or the core specification.

Interaction profile path for PICO 4:

- */interaction_profiles/bytedance/pico4_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/bytedance/pico4_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/bytedance/pico4_controller_bd*, to allow for modifications when promoted to a KHR extension or the core specification.

Interaction profile path for PICO G3:

- */interaction_profiles/bytedance/pico_g3_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/bytedance/pico_g3_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/bytedance/pico_g3_controller_bd*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for user paths for pico_neo3_controller, pico4_controller, and pico_g3_controller:

- */user/hand/left*
- */user/hand/right*

Supported component paths for pico_neo3_controller:

- On /user/hand/left only:
  - *.../input/x/click*
  - *.../input/x/touch*
  - *.../input/y/click*
  - *.../input/y/touch*
- On /user/hand/right only:
  - *.../input/a/click*
  - *.../input/a/touch*
  - *.../input/b/click*
  - *.../input/b/touch*
- *.../input/menu/click*
- *.../input/system/click* (**may** not be available for application use)

- *.../input/trigger/click*
- *.../input/trigger/value*
- *.../input/trigger/touch*
- *.../input/thumbstick/y*
- *.../input/thumbstick/x*
- *.../input/thumbstick/click*
- *.../input/thumbstick/touch*
- *.../input/squeeze/click*
- *.../input/squeeze/value*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../output/haptic*

Supported component paths for pico4_controller:

- On /user/hand/left only:
  - *.../input/x/click*
  - *.../input/x/touch*
  - *.../input/y/click*
  - *.../input/y/touch*
  - *.../input/menu/click*
- On /user/hand/right only:
  - *.../input/a/click*
  - *.../input/a/touch*
  - *.../input/b/click*
  - *.../input/b/touch*
- *.../input/system/click* (**may** not be available for application use)
- *.../input/trigger/click*
- *.../input/trigger/value*
- *.../input/trigger/touch*
- *.../input/thumbstick/y*
- *.../input/thumbstick/x*
- *.../input/thumbstick/click*
- *.../input/thumbstick/touch*

- *.../input/squeeze/click*
- *.../input/squeeze/value*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../output/haptic*

Supported component paths for pico_g3_controller:

- *.../input/trigger/click*
- *.../input/trigger/value*
- *.../input/menu/click*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../input/thumbstick*
- *.../input/thumbstick/click*

Be careful with the following difference:

- pico_neo3_controller supports *.../input/menu/click* both on */user/hand/left* and */user/hand/right*.
- pico4_controller supports *.../input/menu/click* only on */user/hand/left*.
- pico_g3_controller has only one physical controller. When designing suggested bindings for this interaction profile, you **may** suggest bindings for both */user/hand/left* and */user/hand/right*. However, only one of them will be active at a given time, so do not design interactions that require simultaneous use of both hands.

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

Instance extension

Registered Extension Number

172

Revision

2

Ratification Status

Not ratified

Extension and Version Dependencies

OpenXR 1.0

Deprecation State

- *Deprecated* by `XR_EXT_frame_synthesis` extension

Contributors

Jian Zhang, Facebook
Neel Bedekar, Facebook
Xiang Wei, Facebook

Overview

This extension provides support to enable space warp technology on application. By feeding application generated motion vector and depth buffer images, the runtime can do high quality frame extrapolation and reprojection, allow applications to run at half fps but still providing smooth experience to users.

Note

This extension is independent of `XR_KHR_composition_layer_depth`, and both may be enabled and used at the same time, for different purposes. The XrCompositionLayerSpaceWarpInfoFB::`depthSubImage` depth data is dedicated for space warp, and its resolution is usually lower than XrCompositionLayerDepthInfoKHR::`subImage`. See XrSystemSpaceWarpPropertiesFB for suggested resolution of `depthSubImage`.

New Flag Types

```
// Provided by XR_FB_space_warp
typedef XrFlags64 XrCompositionLayerSpaceWarpInfoFlagsFB;
```

```
// Provided by XR_FB_space_warp
// Flag bits for XrCompositionLayerSpaceWarpInfoFlagsFB
static const XrCompositionLayerSpaceWarpInfoFlagsFB
XR_COMPOSITION_LAYER_SPACE_WARP_INFO_FRAME_SKIP_BIT_FB = 0x00000001;
```

Flag Descriptions

- XR_COMPOSITION_LAYER_SPACE_WARP_INFO_FRAME_SKIP_BIT_FB requests that the runtime skips space warp frame extrapolation for a particular frame. This can be used when the application has better knowledge the particular frame will be not a good fit for space warp frame extrapolation.

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_COMPOSITION_LAYER_SPACE_WARP_INFO_FB
- XR_TYPE_SYSTEM_SPACE_WARP_PROPERTIES_FB

New Enums

- XR_COMPOSITION_LAYER_SPACE_WARP_INFO_FRAME_SKIP_BIT_FB

New Structures

When submitting motion vector buffer and depth buffers along with projection layers, add an XrCompositionLayerSpaceWarpInfoFB structure to the XrCompositionLayerProjectionView::next chain, for each XrCompositionLayerProjectionView structure in the given layer.

The XrCompositionLayerSpaceWarpInfoFB structure is defined as:

```
// Provided by XR_FB_space_warp
typedef struct XrCompositionLayerSpaceWarpInfoFB {
    XrStructureType                            type;
    const void*                                next;
    XrCompositionLayerSpaceWarpInfoFlagsFB     layerFlags;
    XrSwapchainSubImage                        motionVectorSubImage;
    XrPosef                                    appSpaceDeltaPose;
    XrSwapchainSubImage                        depthSubImage;
    float                                      minDepth;
    float                                      maxDepth;
    float                                      nearZ;
    float                                      farZ;
} XrCompositionLayerSpaceWarpInfoFB;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `layerFlags` is a bitmask of XrCompositionLayerSpaceWarpInfoFlagsFB.
- `motionVectorSubImage` identifies the motion vector image XrSwapchainSubImage to be associated with the submitted layer XrCompositionLayerProjection.
- `appSpaceDeltaPose` is the incremental application-applied transform, if any, since the previous frame that affects the view. When artificial locomotion (scripted movement, teleportation, etc.) happens, the application might transform the whole XrCompositionLayerProjection::space from one application space pose to another pose between frames. The pose should be identity when there is no XrCompositionLayerProjection::space transformation in application.
- `depthSubImage` identifies the depth image XrSwapchainSubImage to be associated with motionVectorSubImage. The swapchain should be created with `XR_SWAPCHAIN_USAGE_SAMPLED_BIT` | `XR_SWAPCHAIN_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.
- `minDepth` and `maxDepth` are the range of depth values the depth swapchain could have, in the range of [0.0,1.0]. This is akin to min and max values of OpenGL's `glDepthRange`, but with the requirement here that maxDepth ≥ minDepth.
- `nearZ` is the positive distance in meters of the `minDepth` value in the depth swapchain. Applications **may** use a `nearZ` that is greater than `farZ` to indicate depth values are reversed. `nearZ` can be infinite.
- `farZ` is the positive distance in meters of the `maxDepth` value in the depth swapchain. `farZ` can be infinite.

The motion vector data is stored in the `motionVectorSubImage`'s RGB channels, defined in NDC (normalized device coordinates) space, for example, the same surface point's NDC is PrevNDC in previous frame, CurrNDC in current frame, then the motion vector value is "highp vec3 motionVector = (CurrNDC - PrevNDC).xyz;". Signed 16 bit float pixel format is recommended for this image.

The runtime **must** return error `XR_ERROR_VALIDATION_FAILURE` if `nearZ` == `farZ`.

Valid Usage (Implicit)

- The XR_FB_space_warp extension **must** be enabled prior to using XrCompositionLayerSpaceWarpInfoFB
- type **must** be XR_TYPE_COMPOSITION_LAYER_SPACE_WARP_INFO_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- layerFlags **must** be 0 or a valid combination of XrCompositionLayerSpaceWarpInfoFlagBitsFB values
- motionVectorSubImage **must** be a valid XrSwapchainSubImage structure
- depthSubImage **must** be a valid XrSwapchainSubImage structure

When this extension is enabled, an application **can** pass in an XrSystemSpaceWarpPropertiesFB structure in the XrSystemProperties::next chain when calling xrGetSystemProperties to acquire information about recommended motion vector buffer resolution. The XrSystemSpaceWarpPropertiesFB structure is defined as:

```
// Provided by XR_FB_space_warp
typedef struct XrSystemSpaceWarpPropertiesFB {
    XrStructureType    type;
    void*              next;
    uint32_t           recommendedMotionVectorImageRectWidth;
    uint32_t           recommendedMotionVectorImageRectHeight;
} XrSystemSpaceWarpPropertiesFB;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- recommendedMotionVectorImageRectWidth: recommended motion vector and depth image width
- recommendedMotionVectorImageRectHeight: recommended motion vector and depth image height

Valid Usage (Implicit)

- The XR_FB_space_warp extension **must** be enabled prior to using XrSystemSpaceWarpPropertiesFB
- type **must** be XR_TYPE_SYSTEM_SPACE_WARP_PROPERTIES_FB
- next **must** be NULL or a valid pointer to the next structure in a structure chain

Overview

This extension defines a new interaction profile for the Meta Quest Touch Pro Controller.

Meta Quest Touch Pro Controller Profile Path:

- */interaction_profiles/facebook/touch_controller_pro*

> **Note**
>
> The interaction profile path */interaction_profiles/facebook/touch_controller_pro* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/facebook/touch_controller_pro_fb*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

This interaction profile provides inputs and outputs that are a superset of those available in the existing "Oculus Touch Controller" interaction profile:

- */interaction_profiles/oculus/touch_controller*

Supported component paths (Note that the paths which are marked as 'new' are enabled by Meta Quest Touch Pro Controller profile exclusively):

- On */user/hand/left* only:
  - *.../input/x/click*

    - *.../input/x/touch*
    - *.../input/y/click*
    - *.../input/y/touch*
    - *.../input/menu/click*
- On */user/hand/right* only:
    - *.../input/a/click*
    - *.../input/a/touch*
    - *.../input/b/click*
    - *.../input/b/touch*
    - *.../input/system/click* (**may** not be available for application use)
- On both:
    - *.../input/squeeze/value*
    - *.../input/trigger/value*
    - *.../input/trigger/touch*
    - *.../input/thumbstick*
    - *.../input/thumbstick/x*
    - *.../input/thumbstick/y*
    - *.../input/thumbstick/click*
    - *.../input/thumbstick/touch*
    - *.../input/thumbrest/touch*
    - *.../input/grip/pose*
    - *.../input/aim/pose*
    - *.../output/haptic*
    - *.../input/thumbrest/force* (new)
    - *.../input/stylus_fb/force* (new)
    - *.../input/trigger/curl_fb* (new)
    - *.../input/trigger/slide_fb* (new)
    - *.../input/trigger/proximity_fb* (new)
    - *.../input/thumb_fb/proximity_fb* (new)
    - *.../output/haptic_trigger_fb* (new)
    - *.../output/haptic_thumb_fb* (new)

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

New Identifiers

- **stylus_fb**: Meta Quest Touch Pro Controller adds an optional stylus tip that can be interchanged with the lanyard. This tip can detect various pressure levels and could be used for writing or drawing.
- **thumb_fb**: Meta Quest Touch Pro Controller adds a 1-dimensional analog input value for the thumb. This is similar to other triggers on the controller like the fore trigger for the index finger and grip trigger for the middle finger.

Input Path Descriptions

- **/input/thumbrest/force** : Allow developers to access the normalized 1D force value associated with the thumb ranging from 0-6 Newtons: 0 = not pressed, 1 = fully pressed
- **/input/stylus_fb/force** : Allow developers to access the normalized 1D force value associated with the stylus ranging from ~0-2 Newtons: 0 = not pressed, 1 = fully pressed
- **/input/trigger/curl_fb** : This represents how pointed or curled the user's finger is on the trigger: 0 = fully pointed, 1 = finger flat on surface
- **/input/trigger/slide_fb**: This represents how far the user is sliding their index finger along the surface of the trigger: 0 = finger flat on the surface, 1 = finger fully drawn back
- **/input/trigger/proximity_fb** : Bit indicating whether the user's index finger is near the trigger
- **/input/thumb_fb/proximity_fb** : Bit indicating the user's thumb is near the touchpad

Output Path Descriptions

In addition to the VCM motor, Meta Quest Touch Pro Controller has two localized LRA haptics elements located in the fore trigger and under the touchpad.

- **/output/haptic_trigger_fb** represents the path to the haptic element in the trigger
- **/output/haptic_thumb_fb** represents the path to the haptic element under the touchpad

14.18.1. Overview

This extension introduces a new component path, proximity_fb, and adds support for it for the */interaction_profiles/oculus/touch_controller* interaction profile.

14.18.2. New Interaction Profile Component Paths

- proximity_fb - The user is in physical proximity of input source. This **may** be present for any kind of input source representing a physical component, such as a button, if the device includes the necessary sensor. The state of a "proximity_fb" component **must** be `XR_TRUE` if the same input source is returning `XR_TRUE` for either a "touch" or any other component that implies physical contact. The runtime **may** return `XR_TRUE` for "proximity_fb" when "touch" returns `XR_FALSE`. This indicate that the user is hovering just above, but not touching the input source in question. "proximity_fb" components are always boolean.

14.18.3. Interaction Profile Changes

Interaction profile: */interaction_profiles/oculus/touch_controller*

Additional supported component paths for the above profile enabled by this extension:

Valid for user paths:

- */user/hand/left*

- */user/hand/right*

On both:

- *.../input/trigger/proximity_fb* This represents whether the user is in proximity of the trigger button, usually with their index finger.
- *.../input/thumb_fb/proximity_fb* This represents whether the user is in proximity of the input sources at the top of the controller, usually with their thumb.

14.18.4. Example code

The following example code demonstrates detecting when a user lifts their finger off the trigger button.

```
XrInstance instance;           // previously initialized
XrSession session;             // previously initialized
XrActionSet inGameActionSet;   // previously initialized

XrAction indexProximityAction; // previously initialized
XrAction indexTouchAction;     // previously initialized

//  ----------
//  Bind actions to trigger/proximity_fb and trigger/touch
//  ----------

XrPath indexProximityPath, indexTouchPath{XR_NULL_PATH};
// New component exposed by this extension:
CHK_XR(xrStringToPath(instance, "/user/hand/right/input/trigger/proximity_fb",
&indexProximityPath));
// Existing component that is useful together with proximity_fb
CHK_XR(xrStringToPath(instance, "/user/hand/right/input/trigger/touch", &indexTouchPath))

XrPath interactionProfilePath{XR_NULL_PATH};
CHK_XR(xrStringToPath(instance, "/interaction_profiles/oculus/touch_controller",
&interactionProfilePath));

XrActionSuggestedBinding bindings[2];
bindings[0].action = indexProximityAction;
bindings[0].binding = indexProximityPath;
bindings[1].action = indexTouchAction;
bindings[1].binding = indexTouchPath;

XrInteractionProfileSuggestedBinding suggestedBindings{
  .type = XR_TYPE_INTERACTION_PROFILE_SUGGESTED_BINDING,
  .interactionProfile = interactionProfilePath,
  .countSuggestedBindings = 2,
```

```
  .suggestedBindings = bindings,
};
CHK_XR(xrSuggestInteractionProfileBindings(instance, &suggestedBindings));

//  ----------
//  Application main loop
//  ----------

while (1)
{
    // ...

    //  ----------
    //  Query input state
    //  ----------

    XrActionStateBoolean indexTouchState{
        .type = XR_TYPE_ACTION_STATE_BOOLEAN,
    };
    XrActionStateBoolean indexProximityState{
        .type = XR_TYPE_ACTION_STATE_BOOLEAN,
    };
    XrActionStateGetInfo getInfo{
        .type = XR_TYPE_ACTION_STATE_GET_INFO,
    };

    getInfo.action = indexTouchAction;
    CHK_XR(xrGetActionStateBoolean(session, &getInfo, &indexTouchState));
    getInfo.action = indexProximityAction;
    CHK_XR(xrGetActionStateBoolean(session, &getInfo, &indexProximityState));

    //  ----------
    //  Proximity and touch logic
    //  ----------

    // There are only three valid combinations of the proximity and touch values
    if (!indexProximityState.currentState)
    {
        // Index is not in proximity of the trigger button (they might be pointing!)
        // Implies that TouchState.currentState == XR_FALSE
    }
    if (indexProximityState.currentState && !indexTouchState.currentState)
    {
        // Index finger of user is in proximity of, but not touching, the trigger button
        // i.e. they are hovering above the button
    }
    if (indexTouchState.currentState)
    {
```

```
        // Index finger of user is touching the trigger button
        // Implies that ProximityState.currentState == XR_TRUE
    }
}
```

  - *.../input/trigger/slide_meta*

- */input/trigger/force*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- */input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- */input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- */input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- */input/pinch_ext/pose*
- */input/poke_ext/pose*

New Identifiers

- **thumb_meta**: Meta Quest Touch Plus Controller adds an input identifier for the user's thumb on the same hand currently holding the controller. Thumb input is not explicitly bound to any location on the controller.

Input Path Descriptions

- **/input/thumb_meta/proximity_meta** : Boolean indicating the user's thumb is near the inputs on the top face of the controller.
- **/input/trigger/proximity_meta** : Boolean indicating whether the user's index finger is near the trigger.
- **/input/trigger/curl_meta** : Float representing how pointed or curled the user's index finger is on the trigger: 0.0 = fully pointed, 1.0 = finger flat on the surface
- **/input/trigger/slide_meta** : Float representing how far the user is sliding the tip of their index finger along the surface of the trigger: 0.0 = finger flat on the surface, 1.0 = finger fully drawn back.
- **/input/trigger/force** : Float representing the amount of force being applied by the user to the trigger after it reaches the end of the range of travel: 0.0 = no additional pressure applied, 1.0 = maximum detectable pressure applied.

Overview

This extension defines the interaction profile for the Magic Leap 2 Controller.

Magic Leap 2 Controller interaction profile

This interaction profile represents the input sources and haptics on the Magic Leap 2 Controller.

Interaction profile path:

- */interaction_profiles/ml/ml2_controller*

> **Note**
>
> The interaction profile path */interaction_profiles/ml/ml2_controller* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/ml/ml2_controller_ml*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for user paths:

- */user/hand/left*
- */user/hand/right*

Supported component paths:

- *.../input/menu/click*
- *.../input/home/click* (**may** not be available for application use)
- *.../input/trigger/click*

- *.../input/trigger/value*
- *.../input/trackpad/y*
- *.../input/trackpad/x*
- *.../input/trackpad/click*
- *.../input/trackpad/force*
- *.../input/trackpad/touch*
- *.../input/grip/pose*
- *.../input/aim/pose*
- *.../input/shoulder/click*
- *.../output/haptic*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

Overview

This extension enables an application to provide additional reprojection information for a projection composition layer to help the runtime produce better hologram stability and visual quality.

First, the application uses xrEnumerateReprojectionModesMSFT to inspect what reprojection mode the view configuration supports.

The xrEnumerateReprojectionModesMSFT function returns the supported reprojection modes of the view configuration.

```
// Provided by XR_MSFT_composition_layer_reprojection
XrResult xrEnumerateReprojectionModesMSFT(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    XrViewConfigurationType                     viewConfigurationType,
    uint32_t                                    modeCapacityInput,
    uint32_t*                                   modeCountOutput,
    XrReprojectionModeMSFT*                     modes);
```

Parameter Descriptions

- `instance` is the instance from which `systemId` was retrieved.
- `systemId` is the `XrSystemId` whose reprojection modes will be enumerated.
- `viewConfigurationType` is the XrViewConfigurationType to enumerate.
- `modeCapacityInput` is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- `modeCountOutput` is a pointer to the count of the array, or a pointer to the required capacity in the case that `modeCapacityInput` is insufficient.
- `modes` is a pointer to an application-allocated array that will be filled with the XrReprojectionModeMSFT values that are supported by the runtime. It **can** be `NULL` if `modeCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `modes` size.

Valid Usage (Implicit)

- The `XR_MSFT_composition_layer_reprojection` extension **must** be enabled prior to calling xrEnumerateReprojectionModesMSFT
- `instance` **must** be a valid XrInstance handle
- `viewConfigurationType` **must** be a valid XrViewConfigurationType value
- `modeCountOutput` **must** be a pointer to a `uint32_t` value
- If `modeCapacityInput` is not `0`, `modes` **must** be a pointer to an array of `modeCapacityInput` XrReprojectionModeMSFT values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SYSTEM_INVALID
- XR_ERROR_VALIDATION_FAILURE
- XR_ERROR_VIEW_CONFIGURATION_TYPE_UNSUPPORTED

A system **may** support different sets of reprojection modes for different view configuration types.

Then, the application **can** provide reprojection mode for the projection composition layer to inform the runtime that the XR experience **may** benefit from the provided reprojection mode.

An XrCompositionLayerReprojectionInfoMSFT structure **can** be added to the `next` chain of XrCompositionLayerProjection structure when calling xrEndFrame.

```
// Provided by XR_MSFT_composition_layer_reprojection
typedef struct XrCompositionLayerReprojectionInfoMSFT {
    XrStructureType           type;
    const void*               next;
    XrReprojectionModeMSFT    reprojectionMode;
} XrCompositionLayerReprojectionInfoMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `reprojectionMode` is an XrReprojectionModeMSFT enum providing a hint to the reprojection mode to the corresponding projection layer.

Valid Usage (Implicit)

- The XR_MSFT_composition_layer_reprojection extension **must** be enabled prior to using XrCompositionLayerReprojectionInfoMSFT
- type **must** be XR_TYPE_COMPOSITION_LAYER_REPROJECTION_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- reprojectionMode **must** be a valid XrReprojectionModeMSFT value

When the application chained this structure when calling xrEndFrame, the reprojectionMode **must** be one of the supported XrReprojectionModeMSFT returned by xrEnumerateReprojectionModesMSFT function for the corresponding XrViewConfigurationType. Otherwise, the runtime **must** return error XR_ERROR_REPROJECTION_MODE_UNSUPPORTED_MSFT on the xrEndFrame function.

The runtime **must** only use the given information for the corresponding frame in xrEndFrame function, and it **must** not affect other frames.

The XrReprojectionModeMSFT describes the reprojection mode of a projection composition layer.

```
// Provided by XR_MSFT_composition_layer_reprojection
typedef enum XrReprojectionModeMSFT {
    XR_REPROJECTION_MODE_DEPTH_MSFT = 1,
    XR_REPROJECTION_MODE_PLANAR_FROM_DEPTH_MSFT = 2,
    XR_REPROJECTION_MODE_PLANAR_MANUAL_MSFT = 3,
    XR_REPROJECTION_MODE_ORIENTATION_ONLY_MSFT = 4,
    XR_REPROJECTION_MODE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrReprojectionModeMSFT;
```

- `XR_REPROJECTION_MODE_DEPTH_MSFT` indicates the corresponding layer **may** benefit from per-pixel depth reprojection provided by XrCompositionLayerDepthInfoKHR to the projection layer. This mode is typically used for world-locked content that should remain physically stationary as the user walks around.
- `XR_REPROJECTION_MODE_PLANAR_FROM_DEPTH_MSFT` indicates the corresponding layer **may** benefit from planar reprojection and the plane **can** be calculated from the corresponding depth information provided by XrCompositionLayerDepthInfoKHR to the projection layer. This mode works better when the application knows the content is mostly placed on a plane.
- `XR_REPROJECTION_MODE_PLANAR_MANUAL_MSFT` indicates that the corresponding layer **may** benefit from planar reprojection. The application **can** customize the plane by chaining an XrCompositionLayerReprojectionPlaneOverrideMSFT structure to the same layer. The app **can** also omit the plane override, indicating the runtime should use the default reprojection plane settings. This mode works better when the application knows the content is mostly placed on a plane, or when it cannot afford to submit depth information.
- `XR_REPROJECTION_MODE_ORIENTATION_ONLY_MSFT` indicates the layer should be stabilized only for changes to orientation, ignoring positional changes. This mode works better for body-locked content that should follow the user as they walk around, such as 360-degree video.

When the application passes `XR_REPROJECTION_MODE_DEPTH_MSFT` or `XR_REPROJECTION_MODE_PLANAR_FROM_DEPTH_MSFT` mode, it **should** also provide the depth buffer for the corresponding layer using XrCompositionLayerDepthInfoKHR in `XR_KHR_composition_layer_depth` extension. However, if the application does not submit this depth buffer, the runtime **must** apply a runtime defined fallback reprojection mode, and **must** not fail the xrEndFrame function because of this missing depth.

When the application passes `XR_REPROJECTION_MODE_PLANAR_MANUAL_MSFT` or `XR_REPROJECTION_MODE_ORIENTATION_ONLY_MSFT` mode, it **should** avoid providing a depth buffer for the corresponding layer using XrCompositionLayerDepthInfoKHR in `XR_KHR_composition_layer_depth` extension. However, if the application does submit this depth buffer, the runtime **must** not fail the xrEndFrame function because of this unused depth data.

When the application is confident that overriding the reprojection plane can benefit hologram stability, it **can** provide XrCompositionLayerReprojectionPlaneOverrideMSFT structure to further help the runtime to fine tune the reprojection details.

An application **can** add an XrCompositionLayerReprojectionPlaneOverrideMSFT structure to the `next` chain of XrCompositionLayerProjection structure.

The runtime **must** only use the given plane override for the corresponding frame in xrEndFrame function, and it **must** not affect other frames.

```
// Provided by XR_MSFT_composition_layer_reprojection
typedef struct XrCompositionLayerReprojectionPlaneOverrideMSFT {
    XrStructureType    type;
    const void*        next;
    XrVector3f         position;
    XrVector3f         normal;
    XrVector3f         velocity;
} XrCompositionLayerReprojectionPlaneOverrideMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `position` describes the position of the focus plane represented in the corresponding XrCompositionLayerProjection::`space`.
- `normal` is a unit vector describes the focus plane normal represented in the corresponding XrCompositionLayerProjection::`space`.
- `velocity` is a velocity of the position in the corresponding XrCompositionLayerProjection ::`space` measured in meters per second.

A runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the `normal` vector deviates by more than 1% from unit length.

Adding a reprojection plane override **may** benefit various reprojection modes including `XR_REPROJECTION_MODE_DEPTH_MSFT`, `XR_REPROJECTION_MODE_PLANAR_FROM_DEPTH_MSFT` and `XR_REPROJECTION_MODE_PLANAR_MANUAL_MSFT`.

When application choose `XR_REPROJECTION_MODE_ORIENTATION_ONLY_MSFT` mode, the reprojection plane override **may** be ignored by the runtime.

Valid Usage (Implicit)

- The `XR_MSFT_composition_layer_reprojection` extension **must** be enabled prior to using XrCompositionLayerReprojectionPlaneOverrideMSFT
- `type` **must** be `XR_TYPE_COMPOSITION_LAYER_REPROJECTION_PLANE_OVERRIDE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

Overview

This extension provides a mechanism to load a GLTF model for controllers. An application **can** render the controller model using the real time pose input from controller's grip action pose and animate controller parts representing the user's interactions, such as pressing a button, or pulling a trigger.

This extension supports any controller interaction profile that supports *.../grip/pose*. The returned controller model represents the physical controller held in the user's hands, and it **may** be different from the current interaction profile.

Query controller model key

xrGetControllerModelKeyMSFT retrieves the `XrControllerModelKeyMSFT` for a controller. This model key **may** later be used to retrieve the model data.

The xrGetControllerModelKeyMSFT function is defined as:

```
// Provided by XR_MSFT_controller_model
XrResult xrGetControllerModelKeyMSFT(
    XrSession                                   session,
    XrPath                                      topLevelUserPath,
    XrControllerModelKeyStateMSFT*              controllerModelKeyState);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `topLevelUserPath` is the top level user path corresponding to the controller render model being queried (e.g. */user/hand/left* or */user/hand/right*).
- `controllerModelKeyState` is a pointer to the XrControllerModelKeyStateMSFT to write the model key state to.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to calling xrGetControllerModelKeyMSFT
- `session` **must** be a valid XrSession handle
- `controllerModelKeyState` **must** be a pointer to an XrControllerModelKeyStateMSFT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_PATH_INVALID`
- `XR_ERROR_PATH_UNSUPPORTED`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrControllerModelKeyStateMSFT structure is defined as:

```
// Provided by XR_MSFT_controller_model
typedef struct XrControllerModelKeyStateMSFT {
    XrStructureType             type;
    void*                       next;
    XrControllerModelKeyMSFT    modelKey;
} XrControllerModelKeyStateMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `modelKey` is the model key corresponding to the controller render model being queried.

The `modelKey` value for the session represents a unique controller model that can be retrieved from xrLoadControllerModelMSFT function. Therefore, the application **can** use `modelKey` to cache the returned data from xrLoadControllerModelMSFT for the session.

A `modelKey` value of XR_NULL_CONTROLLER_MODEL_KEY_MSFT, represents an invalid model key and indicates there is no controller model yet available. The application **should** keep calling xrGetControllerModelKeyMSFT because the model **may** become available at a later point.

The returned `modelKey` value depends on an active action binding to the corresponding *.../grip/pose* of the controller. Therefore, the application **must** have provided a valid action set containing an action for *.../grip/pose*, and have successfully completed an xrSyncActions call, in order to obtain a valid `modelKey`.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to using XrControllerModelKeyStateMSFT
- `type` **must** be `XR_TYPE_CONTROLLER_MODEL_KEY_STATE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

```
// Provided by XR_MSFT_controller_model
#define XR_NULL_CONTROLLER_MODEL_KEY_MSFT 0
```

XR_NULL_CONTROLLER_MODEL_KEY_MSFT defines an invalid model key value.

```
// Provided by XR_MSFT_controller_model
XR_DEFINE_ATOM(XrControllerModelKeyMSFT)
```

The controller model key used to retrieve the data for the renderable controller model and associated properties and state.

Load controller model as glTF 2.0 data

Once the application obtained a valid `modelKey`, it **can** use the xrLoadControllerModelMSFT function to load the GLB data for the controller model.

The xrLoadControllerModelMSFT function loads the controller model as a byte buffer containing a binary form of glTF (a.k.a GLB file format) for the controller. The binary glTF data **must** conform to glTF 2.0 format defined at https://registry.khronos.org/glTF/specs/2.0/glTF-2.0.html.

```
// Provided by XR_MSFT_controller_model
XrResult xrLoadControllerModelMSFT(
    XrSession                                   session,
    XrControllerModelKeyMSFT                    modelKey,
    uint32_t                                    bufferCapacityInput,
    uint32_t*                                   bufferCountOutput,
    uint8_t*                                    buffer);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `modelKey` is the model key corresponding to the controller render model being queried.
- `bufferCapacityInput` is the capacity of the `buffer` array, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` filled in by the runtime with the count of elements in `buffer` array, or returns the required capacity in the case that `bufferCapacityInput` is insufficient.
- `buffer` is a pointer to an application-allocated array of the model for the device that will be filled with the `uint8_t` values by the runtime. It **can** be `NULL` if `bufferCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

The xrLoadControllerModelMSFT function **may** be a slow operation and therefore **should** be invoked from a non-timing critical thread.

If the input `modelKey` is invalid, i.e. it is XR_NULL_CONTROLLER_MODEL_KEY_MSFT or not a key returned from XrControllerModelKeyStateMSFT, the runtime **must** return

XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT.

Valid Usage (Implicit)

- The XR_MSFT_controller_model extension **must** be enabled prior to calling xrLoadControllerModelMSFT
- session **must** be a valid XrSession handle
- bufferCountOutput **must** be a pointer to a uint32_t value
- If bufferCapacityInput is not 0, buffer **must** be a pointer to an array of bufferCapacityInput uint8_t values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

Animate controller parts

The application **can** animate parts of the glTF model to represent the user's interaction on the controller, such as pressing a button or pulling a trigger.

Once the application loads the glTF model of the controller, it **should** first get XrControllerModelPropertiesMSFT containing an array of node names in the glTF model that **can** be animated. These properties, including the order of these node names in the array, **must** be immutable for a valid modelKey in the session, and therefore **can** be cached. In the frame loop, the application **should** get XrControllerModelStateMSFT to retrieve the pose of each node representing user's

interaction on the controller and apply the transform to the corresponding node in the glTF model using application's glTF renderer.

The xrGetControllerModelPropertiesMSFT function returns the controller model properties for a given `modelKey`.

```
// Provided by XR_MSFT_controller_model
XrResult xrGetControllerModelPropertiesMSFT(
    XrSession                                   session,
    XrControllerModelKeyMSFT                    modelKey,
    XrControllerModelPropertiesMSFT*            properties);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `modelKey` is a valid model key obtained from XrControllerModelKeyStateMSFT
- `properties` is an XrControllerModelPropertiesMSFT returning the properties of the controller model

The runtime **must** return the same data in XrControllerModelPropertiesMSFT for a valid `modelKey`. Therefore, the application **can** cache the returned XrControllerModelPropertiesMSFT using `modelKey` and reuse the data for each frame.

If the input `modelKey` is invalid, i.e. it is XR_NULL_CONTROLLER_MODEL_KEY_MSFT or not a key returned from XrControllerModelKeyStateMSFT, the runtime **must** return `XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to calling xrGetControllerModelPropertiesMSFT
- `session` **must** be a valid XrSession handle
- `properties` **must** be a pointer to an XrControllerModelPropertiesMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The XrControllerModelPropertiesMSFT structure describes the properties of a controller model including an array of XrControllerModelNodePropertiesMSFT.

```
// Provided by XR_MSFT_controller_model
typedef struct XrControllerModelPropertiesMSFT {
    XrStructureType                         type;
    void*                                   next;
    uint32_t                                nodeCapacityInput;
    uint32_t                                nodeCountOutput;
    XrControllerModelNodePropertiesMSFT*    nodeProperties;
} XrControllerModelPropertiesMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `nodeCapacityInput` is the capacity of the `nodeProperties` array, or 0 to indicate a request to retrieve the required capacity.
- `nodeCountOutput` filled in by the runtime with the count of elements in `nodeProperties` array, or returns the required capacity in the case that `nodeCapacityInput` is insufficient.
- `nodeProperties` is a pointer to an application-allocated array that will be filled with the XrControllerModelNodePropertiesMSFT values. It **can** be `NULL` if `nodeCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `nodeProperties` size.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to using XrControllerModelPropertiesMSFT
- `type` **must** be `XR_TYPE_CONTROLLER_MODEL_PROPERTIES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `nodeCapacityInput` is not `0`, `nodeProperties` **must** be a pointer to an array of `nodeCapacityInput` XrControllerModelNodePropertiesMSFT structures

The XrControllerModelNodePropertiesMSFT structure describes properties of animatable nodes, including the node name and parent node name to locate a glTF node in the controller model that **can** be animated based on user's interactions on the controller.

```
// Provided by XR_MSFT_controller_model
typedef struct XrControllerModelNodePropertiesMSFT {
    XrStructureType    type;
    void*              next;
    char               parentNodeName[XR_MAX_CONTROLLER_MODEL_NODE_NAME_SIZE_MSFT];
    char               nodeName[XR_MAX_CONTROLLER_MODEL_NODE_NAME_SIZE_MSFT];
} XrControllerModelNodePropertiesMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `parentNodeName` is the name of the parent node in the provided glTF file. The parent name **may** be empty if it should not be used to locate this node.
- `nodeName` is the name of this node in the provided glTF file.

The node can be located in the glTF node hierarchy by finding the node(s) with the matching node name and parent node name. If the `parentNodeName` is empty, the matching will be solely based on the `nodeName`.

If there are multiple nodes in the glTF file matches the condition above, the first matching node using depth-first traversal in the glTF scene **should** be animated and the rest **should** be ignored.

The runtime **must** not return any `nodeName` or `parentNodeName` that does not match any glTF nodes in the corresponding controller model.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to using XrControllerModelNodePropertiesMSFT
- `type` **must** be `XR_TYPE_CONTROLLER_MODEL_NODE_PROPERTIES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `parentNodeName` **must** be a null-terminated UTF-8 string whose length is less than or equal to `XR_MAX_CONTROLLER_MODEL_NODE_NAME_SIZE_MSFT`
- `nodeName` **must** be a null-terminated UTF-8 string whose length is less than or equal to `XR_MAX_CONTROLLER_MODEL_NODE_NAME_SIZE_MSFT`

The xrGetControllerModelStateMSFT function returns the current state of the controller model representing user's interaction to the controller, such as pressing a button or pulling a trigger.

```
// Provided by XR_MSFT_controller_model
XrResult xrGetControllerModelStateMSFT(
    XrSession                                   session,
    XrControllerModelKeyMSFT                    modelKey,
    XrControllerModelStateMSFT*                 state);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `modelKey` is the model key corresponding to the controller model being queried.
- `state` is a pointer to XrControllerModelStateMSFT and returns the current controller model state.

The runtime **may** return different state for a model key after each call to xrSyncActions, which represents the latest state of the user interactions.

If the input `modelKey` is invalid, i.e. it is XR_NULL_CONTROLLER_MODEL_KEY_MSFT or not a key returned from XrControllerModelKeyStateMSFT, the runtime **must** return `XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to calling xrGetControllerModelStateMSFT
- `session` **must** be a valid XrSession handle
- `state` **must** be a pointer to an XrControllerModelStateMSFT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_CONTROLLER_MODEL_KEY_INVALID_MSFT`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

The XrControllerModelStateMSFT structure describes the state of a controller model, including an array of XrControllerModelNodeStateMSFT.

```
// Provided by XR_MSFT_controller_model
typedef struct XrControllerModelStateMSFT {
    XrStructureType                     type;
    void*                               next;
    uint32_t                            nodeCapacityInput;
    uint32_t                            nodeCountOutput;
    XrControllerModelNodeStateMSFT*     nodeStates;
} XrControllerModelStateMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `nodeCapacityInput` is the capacity of the `nodeStates` array, or 0 to indicate a request to retrieve the required capacity.
- `nodeCountOutput` filled in by the runtime with the count of elements in `nodeStates` array, or returns the required capacity in the case that `nodeCapacityInput` is insufficient.
- `nodeStates` is a pointer to an application-allocated array that will be filled with the XrControllerModelNodeStateMSFT values. It **can** be `NULL` if `nodeCapacityInput` is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `nodeStates` size.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to using XrControllerModelStateMSFT
- `type` **must** be `XR_TYPE_CONTROLLER_MODEL_STATE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `nodeCapacityInput` is not `0`, `nodeStates` **must** be a pointer to an array of `nodeCapacityInput` XrControllerModelNodeStateMSFT structures

The XrControllerModelNodeStateMSFT structure describes the state of a node in a controller model.

```
// Provided by XR_MSFT_controller_model
typedef struct XrControllerModelNodeStateMSFT {
    XrStructureType    type;
    void*              next;
    XrPosef            nodePose;
} XrControllerModelNodeStateMSFT;
```

Parameter Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `nodePose` is an XrPosef of the node in its parent node space.

The state is corresponding to the glTF node identified by the XrControllerModelNodePropertiesMSFT::`nodeName` and XrControllerModelNodePropertiesMSFT::`parentNodeName` of the node property at the same array index in the XrControllerModelPropertiesMSFT::`nodeProperties` in XrControllerModelPropertiesMSFT.

The `nodePose` is based on the user's interaction on the controller at the latest xrSyncActions, represented as the XrPosef of the node in it's parent node space.

Valid Usage (Implicit)

- The `XR_MSFT_controller_model` extension **must** be enabled prior to using XrControllerModelNodeStateMSFT
- `type` **must** be `XR_TYPE_CONTROLLER_MODEL_NODE_STATE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

14.26.1. Overview

This first-person observer view configuration enables the runtime to request the application to render an additional first-person view of the scene to be composed onto video frames being captured from a camera attached to and moved with the primary display on the form factor, which is generally for viewing on a 2D screen by an external observer. This first-person camera will be facing forward with roughly the same perspective as the primary views, and so the application should render its view to show objects that surround the user and avoid rendering the user's body avatar. The runtime is responsible for composing the application's rendered observer view onto the camera frame based on the chosen environment blend mode for this view configuration, as this extension does not provide the associated camera frame to the application.

This extension requires the `XR_MSFT_secondary_view_configuration` extension to also be enabled.

`XR_VIEW_CONFIGURATION_TYPE_SECONDARY_MONO_FIRST_PERSON_OBSERVER_MSFT` requires one projection in each XrCompositionLayerProjection layer.

Runtimes **should** only make this view configuration active when the user or the application activates a runtime feature that will make use of the resulting composed camera frames, for example taking a mixed reality photo. Otherwise, the runtime **should** leave this view configuration inactive to avoid the application wasting CPU and GPU resources rendering unnecessarily for this extra view.

Because this is a first-person view of the scene, applications **can** share a common culling and instanced rendering pass with their primary view renders. However, the view state (pose and FOV) of the first-

person observer view will not match the view state of any of the primary views. Applications enabling this view configuration **must** call xrLocateViews a second time each frame to explicitly query the view state for the XR_VIEW_CONFIGURATION_TYPE_SECONDARY_MONO_FIRST_PERSON_OBSERVER_MSFT configuration.

This secondary view configuration **may** support a different set of environment blend modes than the primary view configuration. For example, a device that only supports additive blending for its primary display may support alpha-blending when composing the first-person observer view with camera frames. The application should render with assets and shaders that produce output acceptable to both the primary and observer view configuration's environment blend modes when sharing render passes across both view configurations.

API Interactions

- Interacts with `XR_EXT_hand_interaction`
- Interacts with `XR_EXT_palm_pose`

Deprecation State

- *Promoted* to `XR_EXT_hand_interaction` extension

Contributors

Yin Li, Microsoft
Lachlan Ford, Microsoft
Alex Turner, Microsoft

Overview

This extension defines a new interaction profile for near interactions and far interactions driven by directly-tracked hands.

Hand interaction profile

Interaction profile path:

- */interaction_profiles/microsoft/hand_interaction*

> **Note**
>
> The interaction profile path */interaction_profiles/microsoft/hand_interaction* defined here does not follow current rules for interaction profile names. If this extension were introduced today, it would be called */interaction_profiles/microsoft/hand_interaction_msft*, to allow for modifications when promoted to a KHR extension or the core specification.

Valid for top level user path:

- */user/hand/left*
- */user/hand/right*

This interaction profile provides basic pose and actions for near and far interactions using hand tracking input.

Supported component paths:

- *.../input/select/value*
- *.../input/squeeze/value*
- *.../input/aim/pose*
- *.../input/grip/pose*

Note

When the runtime supports `XR_VERSION_1_1` and use of OpenXR 1.1 is requested by the application, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_KHR_maintenance1` extension is available and enabled, this interaction profile **must** also support

- *.../input/grip_surface/pose*

Note

When the `XR_EXT_palm_pose` extension is available and enabled, this interaction profile **must** also support

- *.../input/palm_ext/pose*

Note

When the `XR_EXT_hand_interaction` extension is available and enabled, this interaction profile **must** also support

- *.../input/pinch_ext/pose*
- *.../input/poke_ext/pose*

The application **should** use the *.../select/value* and *.../aim/pose* paths for far hand interactions, such as using a virtual laser pointer to target and click a button on the wall. Here, *.../select/value* **can** be used as either a boolean or float action type, where the value `XR_TRUE` or `1.0f` represents a closed hand shape.

The application **should** use the *.../squeeze/value* and *.../grip/pose* for near hand interactions, such as picking up a virtual object within the user's reach from a table. Here, *.../squeeze/value* **can** be used as either a boolean or float action type, where the value `XR_TRUE` or `1.0f` represents a closed hand shape.

The runtime **may** trigger both "select" and "squeeze" actions for the same hand gesture if the user's hand gesture is able to trigger both near and far interactions. The application **should** not assume they are as independent as two buttons on a controller.

14.28.1. Overview

This extension enables hand tracking inputs represented as a dynamic hand mesh. It enables applications to render hands in XR experiences and interact with virtual objects using hand meshes.

The application **must** also enable the `XR_EXT_hand_tracking` extension in order to use this extension.

Inspect system capability

An application **can** inspect whether the system is capable of hand tracking meshes by chaining an XrSystemHandTrackingMeshPropertiesMSFT structure to the XrSystemProperties when calling xrGetSystemProperties.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrSystemHandTrackingMeshPropertiesMSFT {
    XrStructureType    type;
    void*              next;
    XrBool32           supportsHandTrackingMesh;
    uint32_t           maxHandMeshIndexCount;
    uint32_t           maxHandMeshVertexCount;
} XrSystemHandTrackingMeshPropertiesMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension. For more details about the structure chain, see the structure being extended (XrSystemProperties).
- `supportsHandTrackingMesh` is an `XrBool32`, indicating if current system is capable of hand tracking mesh input.
- `maxHandMeshIndexCount` is a `uint32_t` returns the maximum count of indices that will be returned from the hand tracker.
- `maxHandMeshVertexCount` is a `uint32_t` returns the maximum count of vertices that will be returned from the hand tracker.

If a runtime returns `XR_FALSE` for `supportsHandTrackingMesh`, the system does not support hand tracking mesh input, and therefore **must** return `XR_ERROR_FEATURE_UNSUPPORTED` from xrCreateHandMeshSpaceMSFT and xrUpdateHandMeshMSFT. The application **should** avoid using hand mesh functionality when `supportsHandTrackingMesh` is `XR_FALSE`.

If a runtime returns `XR_TRUE` for `supportsHandTrackingMesh`, the system supports hand tracking mesh input. In this case, the runtime **must** return a positive number for `maxHandMeshIndexCount` and `maxHandMeshVertexCount`. An application **should** use `maxHandMeshIndexCount` and `maxHandMeshVertexCount` to preallocate hand mesh buffers and reuse them in their render loop when calling xrUpdateHandMeshMSFT every frame.

Valid Usage (Implicit)

- The `XR_MSFT_hand_tracking_mesh` extension **must** be enabled prior to using XrSystemHandTrackingMeshPropertiesMSFT
- `type` **must** be `XR_TYPE_SYSTEM_HAND_TRACKING_MESH_PROPERTIES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

14.28.2. Obtain a hand tracker handle

An application first creates an XrHandTrackerEXT handle using the xrCreateHandTrackerEXT function for each hand. The application can also reuse the same XrHandTrackerEXT handle previously created for the hand joint tracking. When doing so, the hand mesh input is always in sync with hand joints input with the same XrHandTrackerEXT handle.

14.28.3. Create a hand mesh space

The application creates a hand mesh space using function xrCreateHandMeshSpaceMSFT. The position and normal of hand mesh vertices will be represented in this space.

```
// Provided by XR_MSFT_hand_tracking_mesh
XrResult xrCreateHandMeshSpaceMSFT(
    XrHandTrackerEXT                            handTracker,
    const XrHandMeshSpaceCreateInfoMSFT*        createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- handTracker is an XrHandTrackerEXT handle previously created with the xrCreateHandTrackerEXT function.
- createInfo is the XrHandMeshSpaceCreateInfoMSFT used to specify the hand mesh space.
- space is the returned XrSpace handle of the new hand mesh space.

A hand mesh space location is specified by runtime preference to effectively represent hand mesh vertices without unnecessary transformations. For example, an optical hand tracking system **can** define the hand mesh space origin at the depth camera's optical center.

An application should create separate hand mesh space handles for each hand to retrieve the corresponding hand mesh data. The runtime **may** use the lifetime of this hand mesh space handle to manage the underlying device resources. Therefore, the application **should** destroy the hand mesh handle after it is finished using the hand mesh.

The hand mesh space can be related to other spaces in the session, such as view reference space, or grip action space from the */interaction_profiles/khr/simple_controller* interaction profile. The hand mesh space may be not locatable when the hand is outside of the tracking range, or if focus is removed from the application. In these cases, the runtime **must** not set the XR_SPACE_LOCATION_POSITION_VALID_BIT and XR_SPACE_LOCATION_ORIENTATION_VALID_BIT bits on calls to xrLocateSpace with the hand mesh space, and the application **should** avoid using the returned poses or query for hand mesh data.

If the underlying XrHandTrackerEXT is destroyed, the runtime **must** continue to support xrLocateSpace using the hand mesh space, and it **must** return space location with XR_SPACE_LOCATION_POSITION_VALID_BIT and XR_SPACE_LOCATION_ORIENTATION_VALID_BIT unset.

The application **may** create a mesh space for the reference hand by setting XrHandPoseTypeInfoMSFT::handPoseType to XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT. Hand mesh spaces for the reference hand **must** only be locatable in reference to mesh spaces or joint spaces of the reference hand.

Valid Usage (Implicit)

- The XR_MSFT_hand_tracking_mesh extension **must** be enabled prior to calling xrCreateHandMeshSpaceMSFT
- handTracker **must** be a valid XrHandTrackerEXT handle
- createInfo **must** be a pointer to a valid XrHandMeshSpaceCreateInfoMSFT structure
- space **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshSpaceCreateInfoMSFT {
    XrStructureType       type;
    const void*           next;
    XrHandPoseTypeMSFT    handPoseType;
    XrPosef               poseInHandMeshSpace;
} XrHandMeshSpaceCreateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `handPoseType` is an XrHandPoseTypeMSFT used to specify the type of hand this mesh is tracking. Indices and vertices returned from xrUpdateHandMeshMSFT for a hand type will be relative to the corresponding space create with the same hand type.
- `poseInHandMeshSpace` is an XrPosef defining the position and orientation of the new space's origin within the natural reference frame of the hand mesh space.

Valid Usage (Implicit)

- The `XR_MSFT_hand_tracking_mesh` extension **must** be enabled prior to using XrHandMeshSpaceCreateInfoMSFT
- `type` **must** be `XR_TYPE_HAND_MESH_SPACE_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `handPoseType` **must** be a valid XrHandPoseTypeMSFT value

14.28.4. Locate the hand mesh

The application **can** use the xrUpdateHandMeshMSFT function to retrieve the hand mesh at a given timestamp. The hand mesh's vertices position and normal are represented in the hand mesh space created by xrCreateHandMeshSpaceMSFT with a same XrHandTrackerEXT.

```
// Provided by XR_MSFT_hand_tracking_mesh
XrResult xrUpdateHandMeshMSFT(
    XrHandTrackerEXT                            handTracker,
    const XrHandMeshUpdateInfoMSFT*             updateInfo,
    XrHandMeshMSFT*                             handMesh);
```

Parameter Descriptions

- `handTracker` is an XrHandTrackerEXT handle previously created with xrCreateHandTrackerEXT.
- `updateInfo` is an XrHandMeshUpdateInfoMSFT which contains information to query the hand mesh.
- `handMesh` is an XrHandMeshMSFT structure to receive the updates of hand mesh data.

The application **should** preallocate the index buffer and vertex buffer in XrHandMeshMSFT using the XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshIndexCount` and XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshVertexCount` from the XrSystemHandTrackingMeshPropertiesMSFT returned from the xrGetSystemProperties function.

The application **should** preallocate the XrHandMeshMSFT structure and reuse it for each frame so as to reduce the copies of data when underlying tracking data is not changed. The application should use XrHandMeshMSFT::`indexBufferChanged` and XrHandMeshMSFT::`vertexBufferChanged` in XrHandMeshMSFT to detect changes and avoid unnecessary data processing when there is no changes.

Valid Usage (Implicit)

- The `XR_MSFT_hand_tracking_mesh` extension **must** be enabled prior to calling xrUpdateHandMeshMSFT
- `handTracker` **must** be a valid XrHandTrackerEXT handle
- `updateInfo` **must** be a pointer to a valid XrHandMeshUpdateInfoMSFT structure
- `handMesh` **must** be a pointer to an XrHandMeshMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FEATURE_UNSUPPORTED
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

A XrHandMeshUpdateInfoMSFT describes the information to update a hand mesh.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshUpdateInfoMSFT {
    XrStructureType       type;
    const void*           next;
    XrTime                time;
    XrHandPoseTypeMSFT    handPoseType;
} XrHandMeshUpdateInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- time is the XrTime that describes the time for which the application wishes to query the hand mesh state.
- handPoseType is an XrHandPoseTypeMSFT which describes the type of hand pose of the hand mesh to update.

A runtime **may** not maintain a full history of hand mesh data, therefore the returned XrHandMeshMSFT might return data that's not exactly corresponding to the `time` input. If the runtime cannot return any tracking data for the given `time` at all, it **must** set XrHandMeshMSFT::`isActive` to `XR_FALSE` for the call to xrUpdateHandMeshMSFT. Otherwise, if the runtime returns XrHandMeshMSFT::`isActive` as `XR_TRUE`, the data in XrHandMeshMSFT must be valid to use.

An application can choose different `handPoseType` values to query the hand mesh data. The returned hand mesh **must** be consistent to the hand joint space location on the same XrHandTrackerEXT when using the same XrHandPoseTypeMSFT.

Valid Usage (Implicit)

- The `XR_MSFT_hand_tracking_mesh` extension **must** be enabled prior to using XrHandMeshUpdateInfoMSFT
- `type` **must** be `XR_TYPE_HAND_MESH_UPDATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `handPoseType` **must** be a valid XrHandPoseTypeMSFT value

A XrHandMeshMSFT structure contains data and buffers to receive updates of hand mesh tracking data from xrUpdateHandMeshMSFT function.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshMSFT {
    XrStructureType               type;
    void*                         next;
    XrBool32                      isActive;
    XrBool32                      indexBufferChanged;
    XrBool32                      vertexBufferChanged;
    XrHandMeshIndexBufferMSFT     indexBuffer;
    XrHandMeshVertexBufferMSFT    vertexBuffer;
} XrHandMeshMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `isActive` is an `XrBool32` indicating if the current hand tracker is active.
- `indexBufferChanged` is an `XrBool32` indicating if the `indexBuffer` content was changed during the update.
- `vertexBufferChanged` is an `XrBool32` indicating if the `vertexBuffer` content was changed during the update.
- `indexBuffer` is an XrHandMeshIndexBufferMSFT returns the index buffer of the tracked hand mesh.
- `vertexBuffer` is an XrHandMeshVertexBufferMSFT returns the vertex buffer of the tracked hand mesh.

When the returned `isActive` value is `XR_FALSE`, the runtime indicates the hand is not actively tracked, for example, the hand is outside of sensor's range, or the input focus is taken away from the application. When the runtime returns `XR_FALSE` to `isActive`, it **must** set `indexBufferChanged` and `vertexBufferChanged` to `XR_FALSE`, and **must** not change the content in `indexBuffer` or `vertexBuffer`,

When the returned `isActive` value is `XR_TRUE`, the hand tracking mesh represented in `indexBuffer` and `vertexBuffer` are updated to the latest data of the XrHandMeshUpdateInfoMSFT::`time` given to the xrUpdateHandMeshMSFT function. The runtime **must** set `indexBufferChanged` and `vertexBufferChanged` to reflect whether the index or vertex buffer's content are changed during the update. In this way, the application can easily avoid unnecessary processing of buffers when there's no new data.

The hand mesh is represented in triangle lists and each triangle's vertices are in clockwise order when looking from outside of the hand. When hand tracking is active, i.e. when `isActive` is returned as `XR_TRUE`, the returned `indexBuffer.indexCountOutput` value **must** be positive and multiple of 3, and `vertexBuffer.vertexCountOutput` value **must** be equal to or larger than 3.

Valid Usage (Implicit)

- The `XR_MSFT_hand_tracking_mesh` extension **must** be enabled prior to using XrHandMeshMSFT
- `type` **must** be `XR_TYPE_HAND_MESH_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `indexBuffer` **must** be a valid XrHandMeshIndexBufferMSFT structure
- `vertexBuffer` **must** be a valid XrHandMeshVertexBufferMSFT structure

A XrHandMeshIndexBufferMSFT structure includes an array of indices describing the triangle list of a hand mesh.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshIndexBufferMSFT {
    uint32_t     indexBufferKey;
    uint32_t     indexCapacityInput;
    uint32_t     indexCountOutput;
    uint32_t*    indices;
} XrHandMeshIndexBufferMSFT;
```

Member Descriptions

- `indexBufferKey` is a `uint32_t` serving as the key of the returned index buffer content or 0 to indicate a request to retrieve the latest indices regardless of existing content in `indices`.
- `indexCapacityInput` is a positive `uint32_t` describes the capacity of the `indices` array.
- `indexCountOutput` is a `uint32_t` returned by the runtime with the count of indices written in `indices`.
- `indices` is an array of indices filled in by the runtime, specifying the indices of the triangles list in the vertex buffer.

An application **should** preallocate the indices array using the XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshIndexCount` returned from xrGetSystemProperties. In this way, the application can avoid possible insufficient buffer sizees for each query, and therefore avoid reallocating memory each frame.

The input `indexCapacityInput` **must** not be 0, and `indices` **must** not be `NULL`, or else the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` on calls to the xrUpdateHandMeshMSFT function.

If the input `indexCapacityInput` is not sufficient to contain all output indices, the runtime **must** return `XR_ERROR_SIZE_INSUFFICIENT` on calls to xrUpdateHandMeshMSFT, not change the content in `indexBufferKey` and `indices`, and return 0 for `indexCountOutput`.

If the input `indexCapacityInput` is equal to or larger than the XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshIndexCount` returned from xrGetSystemProperties, the runtime **must** not return `XR_ERROR_SIZE_INSUFFICIENT` error on xrUpdateHandMeshMSFT because of insufficient index buffer size.

If the input `indexBufferKey` is 0, the capacity of indices array is sufficient, and hand mesh tracking is active, the runtime **must** return the latest non-zero `indexBufferKey`, and fill in `indexCountOutput` and `indices`.

If the input `indexBufferKey` is not 0, the runtime **can** either return without changing `indexCountOutput`

or content in indices, and return XR_FALSE for XrHandMeshMSFT::indexBufferChanged indicating the indices are not changed; or return a new non-zero indexBufferKey and fill in latest data in indexCountOutput and indices, and return XR_TRUE for XrHandMeshMSFT::indexBufferChanged indicating the indices are updated to a newer version.

An application **can** keep the XrHandMeshIndexBufferMSFT structure for each frame in a frame loop and use the returned indexBufferKey to identify different triangle list topology described in indices. The application can therefore avoid unnecessary processing of indices, such as coping them to GPU memory.

The runtime **must** return the same indexBufferKey for the same XrHandTrackerEXT at a given time, regardless of the input XrHandPoseTypeMSFT in XrHandMeshUpdateInfoMSFT. This ensures the index buffer has the same mesh topology and allows the application to reason about vertices across different hand pose types. For example, the application **can** build a procedure to perform UV mapping on vertices of a hand mesh using XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT, and apply the resultant UV data on vertices to the mesh returned from the same hand tracker using XR_HAND_POSE_TYPE_TRACKED_MSFT.

Valid Usage (Implicit)

- The XR_MSFT_hand_tracking_mesh extension **must** be enabled prior to using XrHandMeshIndexBufferMSFT
- If indexCapacityInput is not 0, indices **must** be a pointer to an array of indexCapacityInput uint32_t values

A XrHandMeshVertexBufferMSFT structure includes an array of vertices of the hand mesh represented in the hand mesh space.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshVertexBufferMSFT {
    XrTime                   vertexUpdateTime;
    uint32_t                 vertexCapacityInput;
    uint32_t                 vertexCountOutput;
    XrHandMeshVertexMSFT*    vertices;
} XrHandMeshVertexBufferMSFT;
```

Member Descriptions

- `vertexUpdateTime` is an `XrTime` representing the time when the runtime receives the vertex buffer content or 0 to indicate a request to retrieve latest vertices regardless of existing content in `vertices`.
- `vertexCapacityInput` is a positive `uint32_t` describes the capacity of the `vertices` array.
- `vertexCountOutput` is a `uint32_t` filled in by the runtime with the count of vertices written in `vertices`.
- `vertices` is an array of XrHandMeshVertexMSFT filled in by the runtime, specifying the vertices of the hand mesh including the position and normal vector in the hand mesh space.

An application **should** preallocate the vertices array using the XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshVertexCount` returned from xrGetSystemProperties. In this way, the application can avoid possible insufficient buffer sizes for each query, and therefore avoid reallocating memory each frame.

The input `vertexCapacityInput` **must** not be 0, and `vertices` **must** not be `NULL`, or else the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` on calls to the xrUpdateHandMeshMSFT function.

If the input `vertexCapacityInput` is not sufficient to contain all output vertices, the runtime **must** return `XR_ERROR_SIZE_INSUFFICIENT` on calls to the xrUpdateHandMeshMSFT, do not change content in `vertexUpdateTime` and `vertices`, and return 0 for `vertexCountOutput`.

If the input `vertexCapacityInput` is equal to or larger than the XrSystemHandTrackingMeshPropertiesMSFT::`maxHandMeshVertexCount` returned from xrGetSystemProperties, the runtime **must** not return `XR_ERROR_SIZE_INSUFFICIENT` on calls to the xrUpdateHandMeshMSFT because of insufficient vertex buffer size.

If the input `vertexUpdateTime` is 0, and the capacity of the vertices array is sufficient, and hand mesh tracking is active, the runtime **must** return the latest non-zero `vertexUpdateTime`, and fill in the `vertexCountOutput` and `vertices` fields.

If the input `vertexUpdateTime` is not 0, the runtime **can** either return without changing `vertexCountOutput` or the content in `vertices`, and return `XR_FALSE` for XrHandMeshMSFT::`vertexBufferChanged` indicating the vertices are not changed; or return a new non-zero `vertexUpdateTime` and fill in latest data in `vertexCountOutput` and `vertices` and return `XR_TRUE` for XrHandMeshMSFT::`vertexBufferChanged` indicating the vertices are updated to a newer version.

An application **can** keep the XrHandMeshVertexBufferMSFT structure for each frame in frame loop and use the returned `vertexUpdateTime` to detect the changes of the content in `vertices`. The application can therefore avoid unnecessary processing of vertices, such as coping them to GPU memory.

Valid Usage (Implicit)

- The XR_MSFT_hand_tracking_mesh extension **must** be enabled prior to using XrHandMeshVertexBufferMSFT
- If vertexCapacityInput is not 0, vertices **must** be a pointer to an array of vertexCapacityInput XrHandMeshVertexMSFT structures

Each XrHandMeshVertexMSFT includes the position and normal of a vertex of a hand mesh.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandMeshVertexMSFT {
    XrVector3f    position;
    XrVector3f    normal;
} XrHandMeshVertexMSFT;
```

Member Descriptions

- position is an XrVector3f structure representing the position of the vertex in the hand mesh space, measured in meters.
- normal is an XrVector3f structure representing the unweighted normal of the triangle surface at the vertex as a unit vector in hand mesh space.

Valid Usage (Implicit)

- The XR_MSFT_hand_tracking_mesh extension **must** be enabled prior to using XrHandMeshVertexMSFT

14.28.5. Example code for hand mesh tracking

Following example code demos preallocating hand mesh buffers and updating the hand mesh in rendering loop

```
XrInstance instance; // previously initialized
XrSystemId systemId; // previously initialized
XrSession session;   // previously initialized

// Inspect hand tracking mesh system properties
XrSystemHandTrackingMeshPropertiesMSFT handMeshSystemProperties {
    .type = XR_TYPE_SYSTEM_HAND_TRACKING_MESH_PROPERTIES_MSFT,
};
```

```
XrSystemProperties systemProperties {
    .type = XR_TYPE_SYSTEM_PROPERTIES,
    .next = &handMeshSystemProperties,
};
CHK_XR(xrGetSystemProperties(instance, systemId, &systemProperties));
if (!handMeshSystemProperties.supportsHandTrackingMesh) {
    // the system does not support hand mesh tracking
    return;
}

// Get function pointer for xrCreateHandTrackerEXT
PFN_xrCreateHandTrackerEXT pfnCreateHandTrackerEXT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateHandTrackerEXT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateHandTrackerEXT)));

// Create a tracker for left hand.
XrHandTrackerEXT leftHandTracker{};
{
    XrHandTrackerCreateInfoEXT createInfo {
        .type = XR_TYPE_HAND_TRACKER_CREATE_INFO_EXT,
        .hand = XR_HAND_LEFT_EXT,
        .handJointSet = XR_HAND_JOINT_SET_DEFAULT_EXT,
    };
    CHK_XR(pfnCreateHandTrackerEXT(session, &createInfo, &leftHandTracker));
}

// Get function pointer for xrCreateHandMeshSpaceMSFT
PFN_xrCreateHandMeshSpaceMSFT pfnCreateHandMeshSpaceMSFT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateHandMeshSpaceMSFT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateHandMeshSpaceMSFT)));

// Create the hand mesh spaces
XrSpace leftHandMeshSpace{};
{
    XrHandMeshSpaceCreateInfoMSFT createInfo {
        .type = XR_TYPE_HAND_MESH_SPACE_CREATE_INFO_MSFT,
        .poseInHandMeshSpace = {{0, 0, 0, 1}, {0, 0, 0}},
    };
    CHK_XR(pfnCreateHandMeshSpaceMSFT(leftHandTracker, &createInfo, &leftHandMeshSpace));
}

// Preallocate buffers for hand mesh indices and vertices
std::vector<uint32_t> handMeshIndices(handMeshSystemProperties.maxHandMeshIndexCount);
std::vector<XrHandMeshVertexMSFT> handMeshVertices(handMeshSystemProperties
.maxHandMeshVertexCount);
```

```
XrHandMeshMSFT leftHandMesh {
    .type = XR_TYPE_HAND_MESH_MSFT,
    .indexBuffer = {
        .indexCapacityInput = (uint32_t)handMeshIndices.size(),
        .indices = handMeshIndices.data(),
    },
    .vertexBuffer = {
        .vertexCapacityInput = (uint32_t)handMeshVertices.size(),
        .vertices = handMeshVertices.data(),
    },
};

// Get function pointer for xrUpdateHandMeshMSFT
PFN_xrUpdateHandMeshMSFT pfnUpdateHandMeshMSFT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrUpdateHandMeshMSFT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnUpdateHandMeshMSFT)));
while(1){
    // ...
    // For every frame in frame loop
    // ...
    XrFrameState frameState;    // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrHandMeshUpdateInfoMSFT updateInfo {
        .type = XR_TYPE_HAND_MESH_UPDATE_INFO_MSFT,
        .time = time,
    };
    CHK_XR(pfnUpdateHandMeshMSFT(leftHandTracker, &updateInfo, &leftHandMesh));
    if (!leftHandMesh.isActive) {
        // Hand input is not focused or user's hand is out of tracking range.
        // Do not process or render hand mesh.
    } else {
        if (leftHandMesh.indexBufferChanged) {
            // Process indices in indexBuffer.indices
        }

        if (leftHandMesh.vertexBufferChanged) {
            // Process vertices in vertexBuffer.vertices and leftHandMeshSpace
        }
    }
}
```

14.28.6. Get hand reference poses

By default, an XrHandTrackerEXT tracks a default hand pose type, that is to provide best fidelity to the user's actual hand motion. This is the same with XR_HAND_POSE_TYPE_TRACKED_MSFT (i.e. value 0) in a

chained XrHandPoseTypeInfoMSFT structure to the next pointer of XrHandTrackerCreateInfoEXT when calling xrCreateHandTrackerEXT.

Some hand mesh visualizations may require an initial analysis or processing of the hand mesh relative to the joints of the hand. For example, a hand visualization may generate a UV mapping for the hand mesh vertices by raycasting outward from key joints against the mesh to find key vertices.

To avoid biasing such static analysis with the arbitrary tracked hand pose, an application **can** instead create a different XrHandTrackerEXT handle with a reference hand pose type when calling xrCreateHandTrackerEXT. This will instruct the runtime to provide a reference hand pose that is better suited for such static analysis.

An application can chain an XrHandPoseTypeInfoMSFT structure to the XrHandTrackerCreateInfoEXT::next pointer when calling xrCreateHandTrackerEXT to indicate the hand tracker to return the hand pose of specific XrHandPoseTypeMSFT.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef struct XrHandPoseTypeInfoMSFT {
    XrStructureType       type;
    const void*           next;
    XrHandPoseTypeMSFT    handPoseType;
} XrHandPoseTypeInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- handPoseType is an XrHandPoseTypeMSFT that describes the type of hand pose of the hand tracking.

Valid Usage (Implicit)

- The XR_MSFT_hand_tracking_mesh extension **must** be enabled prior to using XrHandPoseTypeInfoMSFT
- type **must** be XR_TYPE_HAND_POSE_TYPE_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- handPoseType **must** be a valid XrHandPoseTypeMSFT value

The XrHandPoseTypeMSFT describes the type of input hand pose from XrHandTrackerEXT.

```
// Provided by XR_MSFT_hand_tracking_mesh
typedef enum XrHandPoseTypeMSFT {
    XR_HAND_POSE_TYPE_TRACKED_MSFT = 0,
    XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT = 1,
    XR_HAND_POSE_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrHandPoseTypeMSFT;
```

Enumerant Descriptions

- XR_HAND_POSE_TYPE_TRACKED_MSFT represents a hand pose provided by actual tracking of the user's hand.
- XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT represents a stable reference hand pose in a relaxed open hand shape.

The XR_HAND_POSE_TYPE_TRACKED_MSFT input provides best fidelity to the user's actual hand motion. When the hand tracking input requires the user to be holding a controller in their hand, the hand tracking input will appear as the user virtually holding the controller. This input can be used to render the hand shape together with the controller in hand.

The XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT input does not move with the user's actual hand. Through this reference hand pose, an application **can** get a stable hand joint and mesh that has the same mesh topology as the tracked hand mesh using the same XrHandTrackerEXT, so that the application can apply the data computed from a reference hand pose to the corresponding tracked hand.

Although a reference hand pose does not move with user's hand motion, the bone length and hand thickness **may** be updated, for example when tracking result refines, or a different user's hand is detected. The application **should** update reference hand joints and meshes when the tracked mesh's indexBufferKey is changed or when the isActive value returned from xrUpdateHandMeshMSFT changes from XR_FALSE to XR_TRUE. It can use the returned indexBufferKey and vertexUpdateTime from xrUpdateHandMeshMSFT to avoid unnecessary CPU or GPU work to process the neutral hand inputs.

14.28.7. Example code for reference hand mesh update

The following example code demonstrates detecting reference hand mesh changes and retrieving data for processing.

```
XrInstance instance;                // previously initialized
XrSession session;                  // previously initialized
XrHandTrackerEXT handTracker;       // previously initialized with handJointSet set to
XR_HAND_JOINT_SET_DEFAULT_MSFT
XrSpace handMeshReferenceSpace;     // previously initialized with handPoseType set to
XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT
```

```
XrHandMeshMSFT referenceHandMesh;   // previously initialized with preallocated buffers

// Get function pointer for xrUpdateHandMeshMSFT
PFN_xrUpdateHandMeshMSFT pfnUpdateHandMeshMSFT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrUpdateHandMeshMSFT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnUpdateHandMeshMSFT)));

// Get function pointer for xrCreateHandTrackerEXT
PFN_xrCreateHandTrackerEXT pfnCreateHandTrackerEXT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrCreateHandTrackerEXT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnCreateHandTrackerEXT)));

// Get function pointer for xrLocateHandJointsEXT
PFN_xrLocateHandJointsEXT pfnLocateHandJointsEXT = nullptr;
CHK_XR(xrGetInstanceProcAddr(instance, "xrLocateHandJointsEXT",
                             reinterpret_cast<PFN_xrVoidFunction*>(
                             &pfnLocateHandJointsEXT)));
while(1){
    // ...
    // For every frame in frame loop
    // ...
    XrFrameState frameState;    // previously returned from xrWaitFrame
    const XrTime time = frameState.predictedDisplayTime;

    XrHandMeshUpdateInfoMSFT updateInfo {
        .type = XR_TYPE_HAND_MESH_UPDATE_INFO_MSFT,
        .time = time,
        .handPoseType = XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT,
    };
    CHK_XR(pfnUpdateHandMeshMSFT(handTracker, &updateInfo, &referenceHandMesh));

    // Detect if reference hand mesh is changed.
    if (referenceHandMesh.indexBufferChanged || referenceHandMesh.vertexBufferChanged) {

        // Query the joint location using "open palm" reference hand pose.
        XrHandPoseTypeInfoMSFT handPoseTypeInfo {
            .type = XR_TYPE_HAND_POSE_TYPE_INFO_MSFT,
            .handPoseType = XR_HAND_POSE_TYPE_REFERENCE_OPEN_PALM_MSFT,
        };

        XrHandTrackerCreateInfoEXT createInfo {
            .type = XR_TYPE_HAND_TRACKER_CREATE_INFO_EXT,
            .next = &handPoseTypeInfo,
            .hand = XR_HAND_LEFT_EXT,
            .handJointSet = XR_HAND_JOINT_SET_DEFAULT_EXT,
        };
```

```
        XrHandTrackerEXT referenceHandTracker {XR_NULL_HANDLE};
        CHK_XR(pfnCreateHandTrackerEXT(session, &createInfo, &referenceHandTracker));

        XrHandJointsLocateInfoEXT locateInfo {
            .type = XR_TYPE_HAND_JOINTS_LOCATE_INFO_EXT,
            .next = &handPoseTypeInfo,
            .baseSpace = handMeshReferenceSpace,  // Query joint location relative to
hand mesh reference space
            .time = time,
        };

        std::array<XrHandJointLocationEXT, XR_HAND_JOINT_COUNT_EXT> jointLocations;
        XrHandJointLocationsEXT locations {
            .type = XR_TYPE_HAND_JOINT_LOCATIONS_EXT,
            .jointCount = jointLocations.size(),
            .jointLocations = jointLocations.data(),
        };

        CHK_XR(pfnLocateHandJointsEXT(referenceHandTracker, &locateInfo, &locations));

        // Generate UV map using tip/wrist location and referenceHandMesh.vertexBuffer
        // For example, gradually changes color from the tip of the hand to wrist.
    }
}
```

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- XR_TYPE_HAND_MESH_SPACE_CREATE_INFO_MSFT
- XR_TYPE_HAND_MESH_UPDATE_INFO_MSFT
- XR_TYPE_HAND_MESH_MSFT
- XR_TYPE_SYSTEM_HAND_TRACKING_MESH_PROPERTIES_MSFT
- XR_TYPE_HAND_POSE_TYPE_INFO_MSFT

New Enums

- XrHandPoseTypeMSFT

New Structures

- XrHandMeshSpaceCreateInfoMSFT
- XrHandMeshUpdateInfoMSFT
- XrHandMeshMSFT
- XrHandMeshIndexBufferMSFT
- XrHandMeshVertexBufferMSFT
- XrHandMeshVertexMSFT
- XrSystemHandTrackingMeshPropertiesMSFT
- XrHandPoseTypeInfoMSFT

New Functions

- xrCreateHandMeshSpaceMSFT
- xrUpdateHandMeshMSFT

Issues

Version History

- Revision 1, 2019-09-20 (Yin LI)
  - Initial extension description
- Revision 2, 2020-04-20 (Yin LI)
  - Change joint spaces to locate joints function.
- Revision 3, 2021-04-13 (Rylie Pavlik, Collabora, Ltd.)
  - Correctly show function pointer retrieval in sample code
- Revision 4, 2021-10-20 (Darryl Gough)
  - Winding order for hand mesh is corrected to clockwise to match runtime behavior.

Overview

This extension enables the runtime to attach to app-provided HolographicSpace and CoreWindow WinRT objects when an XrSession is created. Applications may use this extension to create and control the CoreWindow/App View objects, allowing the app to subscribe to keyboard input events and react to activation event arguments. These events and data would otherwise be inaccessible if the application simply managed the app state and lifetime exclusively through the OpenXR API. This extension is only valid to use where an application can create a CoreWindow, such as UWP applications on the HoloLens.

The XrHolographicWindowAttachmentMSFT structure is defined as:

```
// Provided by XR_MSFT_holographic_window_attachment
typedef struct XrHolographicWindowAttachmentMSFT {
    XrStructureType    type;
    const void*        next;
    IUnknown*          holographicSpace;
    IUnknown*          coreWindow;
} XrHolographicWindowAttachmentMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `holographicSpace` is a pointer to a valid `Windows`.Graphics.Holographic.HolographicSpace.
- `coreWindow` is a pointer to a valid `Windows`.UI.Core.CoreWindow.

When creating a holographic window-backed XrSession, the application provides a pointer to an XrHolographicWindowAttachmentMSFT in the `next` chain of the XrSessionCreateInfo.

The session state of a holographic window-backed XrSession will only reach `XR_SESSION_STATE_VISIBLE` when the provided CoreWindow is made visible. If the CoreWindow is for a secondary app view, the application must programmatically request to make the CoreWindow visible (e.g. with `ApplicationViewSwitcher.TryShowAsStandaloneAsync` or `ApplicationViewSwitcher.SwitchAsync`).

The app **must** not call xrCreateSession while the specified CoreWindow thread is blocked, otherwise the call **may** deadlock.

Valid Usage (Implicit)

- The `XR_MSFT_holographic_window_attachment` extension **must** be enabled prior to using XrHolographicWindowAttachmentMSFT
- `type` **must** be `XR_TYPE_HOLOGRAPHIC_WINDOW_ATTACHMENT_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `holographicSpace` **must** be a pointer to an `IUnknown` value
- `coreWindow` **must** be a pointer to an `IUnknown` value

14.29.1. Sample code

Following example demos the usage of holographic window attachment and use the attached CoreWindow to receive keyboard input, use `CoreTextEditContext` to handle text typing experience, and use `IActivatedEventArgs` to handle protocol launching arguments.

```
struct AppView : implements<AppView, IFrameworkView> {
    void Initialize(CoreApplicationView const& applicationView) {
        applicationView.Activated({this, &AppView::OnActivated});
    }

    void Load(winrt::hstring const& entryPoint) {
    }

    void Uninitialize() {
    }

    void Run() {
        // Creating a HolographicSpace before activating the CoreWindow to make it a holographic window
        CoreWindow window = CoreWindow::GetForCurrentThread();
        HolographicSpace holographicSpace = Windows::Graphics::Holographic::HolographicSpace::CreateForCoreWindow(window);
```

```
        window.Activate();

        // [xrCreateInstance, xrGetSystem, and create a graphics binding]

        XrHolographicWindowAttachmentMSFT holographicWindowAttachment {
            .type = XR_TYPE_ATTACHED_CORE_WINDOW_MSFT,
            .next = &graphicsBinding,
            .coreWindow = window.as<IUnknown>().get(),
            .holographicSpace = holographicSpace.as<IUnknown>().get(),
        };

        XrSessionCreateInfo sessionCreateInfo {
            .type = XR_TYPE_SESSION_CREATE_INFO,
            .next = &holographicWindowAttachment,
            .systemId = systemId,
        };

        XrSession session {XR_NULL_HANDLE};
        CHECK_XRCMD(xrCreateSession(instance, &sessionCreateInfo, &session));

        while (!m_windowClosed) {
            window.Dispatcher().ProcessEvents(CoreProcessEventsOption
::ProcessAllIfPresent);

            // [OpenXR calls: Poll events, sync actions, render, and submit frames].
        }
    }

    void SetWindow(CoreWindow const& window) {
        window.Closed({this, &AppView::OnWindowClosed});
        window.KeyDown({this, &AppView::OnKeyDown});

        // This sample customizes the text input pane with manual display policy and
email address scope.
        windows::CoreTextServicesManager manager = windows::CoreTextServicesManager
::GetForCurrentView();
        windows::CoreTextEditContext editingContext = manager.CreateEditContext();
        editingContext.InputPaneDisplayPolicy(windows::
CoreTextInputPaneDisplayPolicy::Manual);
        editingContext.InputScope(windows::CoreTextInputScope::EmailAddress);
    }

    void OnWindowClosed(CoreWindow const& sender, CoreWindowEventArgs const& args) {
        m_windowClosed = true;
    }

    void OnKeyDown(CoreWindow const& sender, KeyEventArgs const& args) {
        // [Process key down]
```

```
60      }
61
62      void OnActivated(CoreApplicationView const&, IActivatedEventArgs const& args) {
63          if (args.Kind() == windows::ActivationKind::Protocol) {
64              auto eventArgs{args.as<windows::ProtocolActivatedEventArgs>()};
65              // Use the protocol activation parameters in eventArgs.Uri();
66          }
67
68          // Inspecting whether the application is launched from within holographic
    shell or from desktop.
69          if (windows::HolographicApplicationPreview::IsHolographicActivation(args)) {
70              // App activation is targeted at the holographic shell.
71          } else {
72              // App activation is targeted at the desktop.
73          }
74
75          // NOTE: CoreWindow is activated later after the HolographicSpace has been
    created.
76      }
77
78      bool m_windowClosed{false};
79  };
80
81  struct AppViewSource : winrt::implements<AppViewSource, IFrameworkViewSource> {

Overview

This extension supports conversion between XrSpatialAnchorMSFT and Windows.Perception.Spatial.SpatialAnchor. An application **can** use this extension to persist spatial anchors on the Windows device through SpatialAnchorStore or transfer spatial anchors between devices through SpatialAnchorTransferManager.

The xrCreateSpatialAnchorFromPerceptionAnchorMSFT function creates a XrSpatialAnchorMSFT handle from an IUnknown pointer to Windows.Perception.Spatial.SpatialAnchor.

```
// Provided by XR_MSFT_perception_anchor_interop
XrResult xrCreateSpatialAnchorFromPerceptionAnchorMSFT(
    XrSession                                   session,
    IUnknown*                                   perceptionAnchor,
    XrSpatialAnchorMSFT*                        anchor);
```

Parameter Descriptions

- `session` is the specified XrSession.
- `perceptionAnchor` is an IUnknown pointer to a Windows.Perception.Spatial.SpatialAnchor object.
- `anchor` is a pointer to XrSpatialAnchorMSFT to receive the returned anchor handle.

The input `perceptionAnchor` **must** support successful `QueryInterface` to Windows.Perception.Spatial.SpatialAnchor , otherwise the runtime **must** return `XR_ERROR_VALIDATION_FAILURE`.

If the function successfully returned, the output `anchor` **must** be a valid handle. This also increments the refcount of the `perceptionAnchor` object.

When application is done with the `anchor` handle, it **can** be destroyed using xrDestroySpatialAnchorMSFT function. This also decrements the refcount of underlying windows perception anchor object.

Valid Usage (Implicit)

- The `XR_MSFT_perception_anchor_interop` extension **must** be enabled prior to calling xrCreateSpatialAnchorFromPerceptionAnchorMSFT
- `session` **must** be a valid XrSession handle
- `perceptionAnchor` **must** be a pointer to an `IUnknown` value
- `anchor` **must** be a pointer to an XrSpatialAnchorMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The xrTryGetPerceptionAnchorFromSpatialAnchorMSFT function converts a XrSpatialAnchorMSFT handle into an IUnknown pointer to Windows.Perception.Spatial.SpatialAnchor.

```
// Provided by XR_MSFT_perception_anchor_interop
XrResult xrTryGetPerceptionAnchorFromSpatialAnchorMSFT(
    XrSession                                   session,
    XrSpatialAnchorMSFT                         anchor,
    IUnknown**                                  perceptionAnchor);
```

Parameter Descriptions

- session is the specified XrSession.
- anchor is a valid XrSpatialAnchorMSFT handle.
- perceptionAnchor is a valid pointer to IUnknown pointer to receive the output Windows.Perception.Spatial.SpatialAnchor object.

If the runtime can convert the anchor to a Windows.Perception.Spatial.SpatialAnchor object, this function **must** return XR_SUCCESS, and the output IUnknown in the pointer of perceptionAnchor **must** be not NULL. This also increments the refcount of the object. The application **can** then use QueryInterface to get the pointer for Windows.Perception.Spatial.SpatialAnchor object. The application **should** release the COM pointer after done with the object, or attach it to a smart COM pointer such as winrt::com_ptr.

If the runtime cannot convert the `anchor` to a Windows.Perception.Spatial.SpatialAnchor object, the function **must** return `XR_SUCCESS`, and the output `IUnknown` in the pointer of `perceptionAnchor` **must** be `NULL`.

Valid Usage (Implicit)

- The `XR_MSFT_perception_anchor_interop` extension **must** be enabled prior to calling xrTryGetPerceptionAnchorFromSpatialAnchorMSFT
- `session` **must** be a valid XrSession handle
- `anchor` **must** be a valid XrSpatialAnchorMSFT handle
- `perceptionAnchor` **must** be a pointer to a pointer to an `IUnknown` value
- `anchor` **must** have been created, allocated, or retrieved from `session`

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_VALIDATION_FAILURE`

Extension and Version Dependencies

OpenXR 1.0
and
`XR_MSFT_scene_understanding`

Deprecation State

- *Obsoleted* by `XR_EXT_spatial_marker_tracking` extension

Contributors

Alain Zanchetta, Microsoft
Yin Li, Microsoft
Alex Turner, Microsoft

14.31.1. Overview

This extension enables the application to observe the tracked markers, such as the QR Code markers in ISO/IEC 18004:2015. This extension also enables future extensions to easily add new types of marker

tracking.

The application **must** enable both XR_MSFT_scene_marker and XR_MSFT_scene_understanding in order to use this extension.

Note

A typical use of this extension is:

1. Verify if marker detection is supported by calling xrEnumerateSceneComputeFeaturesMSFT and validate that the returned supported features include XR_SCENE_COMPUTE_FEATURE_MARKER_MSFT.
2. If supported, create an XrSceneObserverMSFT handle.
3. Pass in XR_SCENE_COMPUTE_FEATURE_MARKER_MSFT as requested feature when starting the scene compute by calling xrComputeNewSceneMSFT function.
4. Inspect the completion of computation by polling xrGetSceneComputeStateMSFT.
5. Once compute is successfully completed, create an XrSceneMSFT handle to the result by calling xrCreateSceneMSFT.
6. Get the list of detected markers using xrGetSceneComponentsMSFT:
   - optionally: filter the type of the returned markers using XrSceneMarkerTypeFilterMSFT.
   - optionally: retrieve additional marker properties by chaining XrSceneMarkersMSFT and/or XrSceneMarkerQRCodesMSFT to the next pointer of XrSceneComponentsMSFT.
7. Get the data encoded in a marker using xrGetSceneMarkerDecodedStringMSFT or xrGetSceneMarkerRawDataMSFT.
8. Locate markers using xrLocateSceneComponentsMSFT.

14.31.2. Retrieve marker properties

The XrSceneMarkersMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_marker
typedef struct XrSceneMarkersMSFT {
    XrStructureType       type;
    const void*           next;
    uint32_t              sceneMarkerCapacityInput;
    XrSceneMarkerMSFT*    sceneMarkers;
} XrSceneMarkersMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. See also: XrSceneComponentsMSFT, XrSceneMarkerQRCodesMSFT
- `sceneMarkerCapacityInput` is a `uint32_t` indicating the capacity of elements in the `sceneMarkers` array.
- `sceneMarkers` is an array of XrSceneMarkerMSFT to fill with the properties of the markers.

Once the application creates an XrSceneMSFT after a successful scene compute, it **can** retrieve the scene markers' properties by chaining XrSceneMarkersMSFT structure to the next pointer of XrSceneComponentsGetInfoMSFT when calling xrGetSceneComponentsMSFT.

xrGetSceneComponentsMSFT follows the two-call idiom for filling the XrSceneComponentsMSFT structure to which an XrSceneMarkersMSFT structure **can** be chained.

The input `sceneMarkerCapacityInput` **must** be equal to or greater than the corresponding XrSceneComponentsMSFT::componentCapacityInput, otherwise the runtime **must** return `XR_ERROR_SIZE_INSUFFICIENT`.

The actual count of elements returned in the array `sceneMarkers` is consistent with the extended XrSceneComponentsMSFT structure and returned in XrSceneComponentsMSFT::`componentCountOutput`.

Valid Usage (Implicit)

- The `XR_MSFT_scene_marker` extension **must** be enabled prior to using XrSceneMarkersMSFT
- `type` **must** be `XR_TYPE_SCENE_MARKERS_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `sceneMarkerCapacityInput` is not `0`, `sceneMarkers` **must** be a pointer to an array of `sceneMarkerCapacityInput` XrSceneMarkerMSFT structures

The XrSceneMarkerMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_marker
typedef struct XrSceneMarkerMSFT {
    XrSceneMarkerTypeMSFT    markerType;
    XrTime                   lastSeenTime;
    XrOffset2Df              center;
    XrExtent2Df              size;
} XrSceneMarkerMSFT;
```

Member Descriptions

- `markerType` is an XrSceneMarkerTypeMSFT indicating the type of the marker.
- `lastSeenTime` is an `XrTime` indicating when the marker was seen last.
- `center` is an XrOffset2Df structure representing the location of the center of the axis-aligned bounding box of the marker in the XY plane of the marker's coordinate system.
- `size` is an XrExtent2Df structure representing the width and height of the axis-aligned bounding box of the marker in the XY plane of the marker's coordinate system.

The XrSceneMarkerMSFT structure is an element in the array of XrSceneMarkersMSFT::`sceneMarkers`.

Refer to the QR code convention for an example of marker's center and size in the context of a QR code.

When the runtime updates the location or properties of an observed marker, the runtime **must** set the XrSceneMarkerMSFT::`lastSeenTime` to the new timestamp of the update.

When the runtime cannot observe a previously observed XrSceneMarkerMSFT, the runtime **must** keep the previous `lastSeenTime` for the marker. Hence, the application **can** use the `lastSeenTime` to know how fresh the tracking information is for a given marker.

The `center` and `size` are measured in meters, relative to the XrPosef of the marker for the visual bound of the marker in XY plane, regardless of the marker type.

Valid Usage (Implicit)

- The `XR_MSFT_scene_marker` extension **must** be enabled prior to using XrSceneMarkerMSFT

The XrSceneMarkerTypeFilterMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_marker
typedef struct XrSceneMarkerTypeFilterMSFT {
    XrStructureType           type;
    const void*               next;
    uint32_t                  markerTypeCount;
    XrSceneMarkerTypeMSFT*    markerTypes;
} XrSceneMarkerTypeFilterMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `markerTypeCount` is a `uint32_t` indicating the count of elements in the `markerTypes` array.
- `markerTypes` is an array of XrSceneMarkerTypeMSFT indicating the types of markers to return.

The application **can** filter the returned scene components to specific marker types by chaining XrSceneMarkerTypeFilterMSFT to the `next` pointer of XrSceneComponentsGetInfoMSFT when calling xrGetSceneComponentsMSFT.

When XrSceneMarkerTypeFilterMSFT is provided to xrGetSceneComponentsMSFT, the runtime **must** only return scene components that match the requested types.

The application **must** provide a non-empty array of unique `markerTypes`, i.e. the `markerTypeCount` **must** be positive and the elements in the `markerTypes` array **must** not have duplicated values. Otherwise, the runtime **must** return `XR_ERROR_VALIDATION_FAILURE` for xrGetSceneComponentsMSFT function.

Valid Usage (Implicit)

- The `XR_MSFT_scene_marker` extension **must** be enabled prior to using XrSceneMarkerTypeFilterMSFT
- `type` **must** be `XR_TYPE_SCENE_MARKER_TYPE_FILTER_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `markerTypeCount` is not `0`, `markerTypes` **must** be a pointer to an array of `markerTypeCount` XrSceneMarkerTypeMSFT values

The XrSceneMarkerTypeMSFT identifies the type of a scene marker.

```
// Provided by XR_MSFT_scene_marker
typedef enum XrSceneMarkerTypeMSFT {
    XR_SCENE_MARKER_TYPE_QR_CODE_MSFT = 1,
    XR_SCENE_MARKER_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneMarkerTypeMSFT;
```

Enumerant Descriptions

- `XR_SCENE_MARKER_TYPE_QR_CODE_MSFT` represents a marker that follows the ISO standard for QR code in ISO/IEC 18004:2015.

14.31.3. Locate markers

Applications **can** use xrLocateSceneComponentsMSFT to locate an XrSceneMarkerMSFT.

The scene marker's locations are snapshots of the XrSceneMSFT, that do not change for the lifecycle of the result. To get updated tracking, the application **can** issue another xrComputeNewSceneMSFT and obtain a new XrSceneMSFT. The application **can** use the XrSceneComponentMSFT::`id` to correlate the same marker across multiple scene computes.

The pose and geometry of scene markers returned from this extension follows these general conventions:

- The marker image reside in the plane of X and Y axes.
- Z axis is perpendicular to the X and Y axes and follows the right hand rule. +Z is pointing into the marker image.
- The origin of the marker is runtime defined for the specific XrSceneMarkerTypeMSFT, and it typically represents the most stable and accurate point for tracking the marker. This allows the application to use the marker as a tracked point.
- In cases where the origin does not necessarily coincide with the center of the marker geometry, applications can obtain additional geometry information from the XrSceneMarkerMSFT structure. This information includes the center and size of the marker image in the X and Y plane.

The exact origin and geometry properties relative to the tracked marker image in physical world **must** be well defined and consistent for each XrSceneMarkerTypeMSFT, including the new marker types defined in future extensions.

14.31.4. The convention of QRCode marker location

For a marker with `XR_SCENE_MARKER_TYPE_QR_CODE_MSFT`, the origin is at the top left corner of the QR code image, where the orientation of the QR code image in the XY plane follows the convention in ISO/IEC 18004:2015. The X axis of QR code pose points to the right of the marker image, and the Z axis points inward to the marker image, as illustrated in following image.

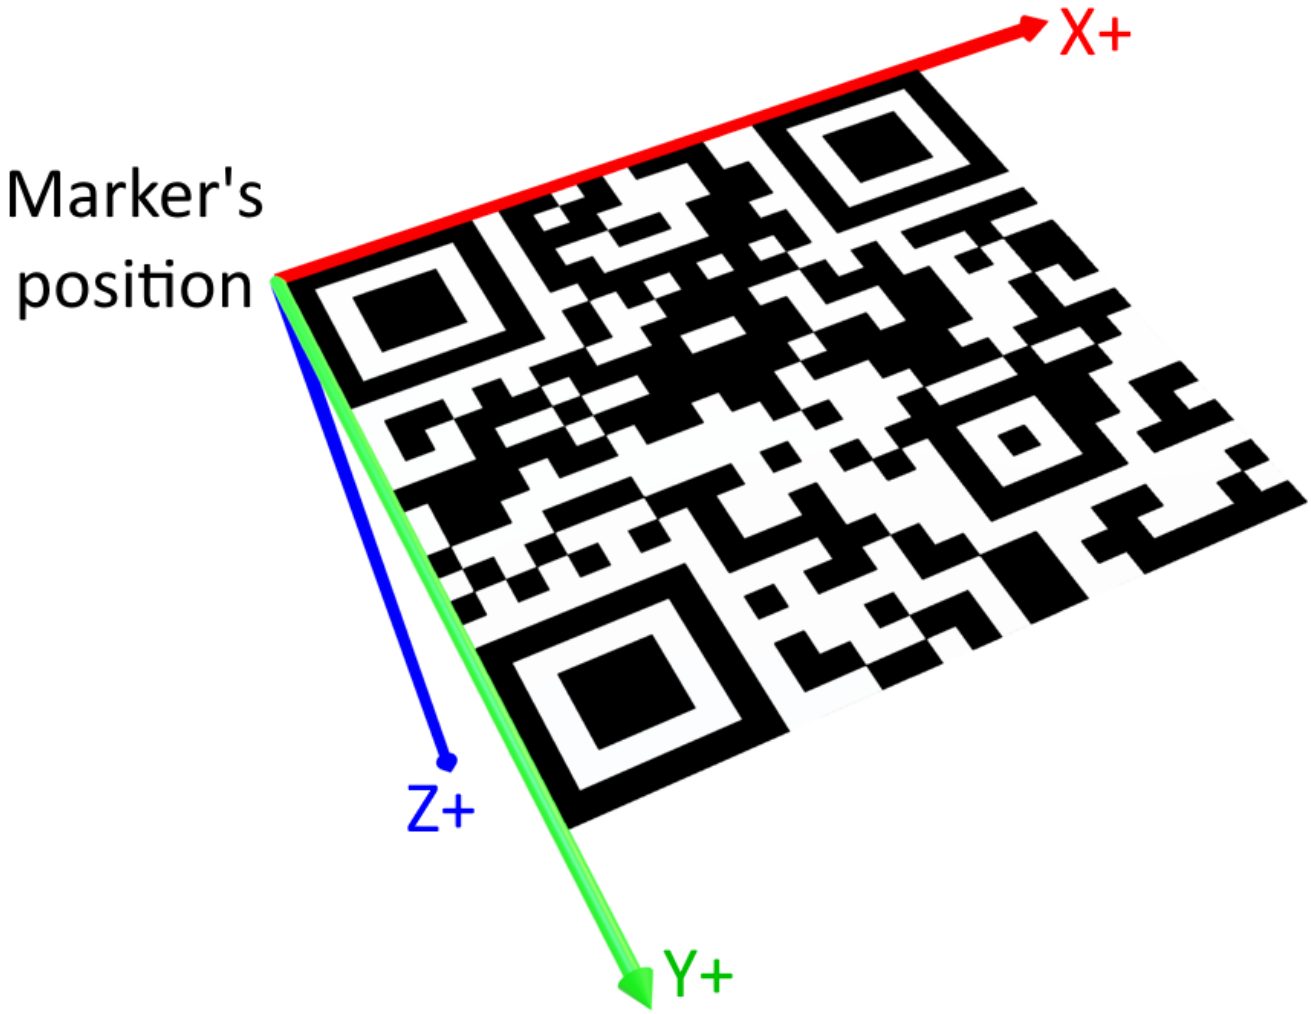

Figure 41. The pose convention of a QR code marker.

The QR Code marker's center and size are defined in the XY plane, as illustrated in following pictures.

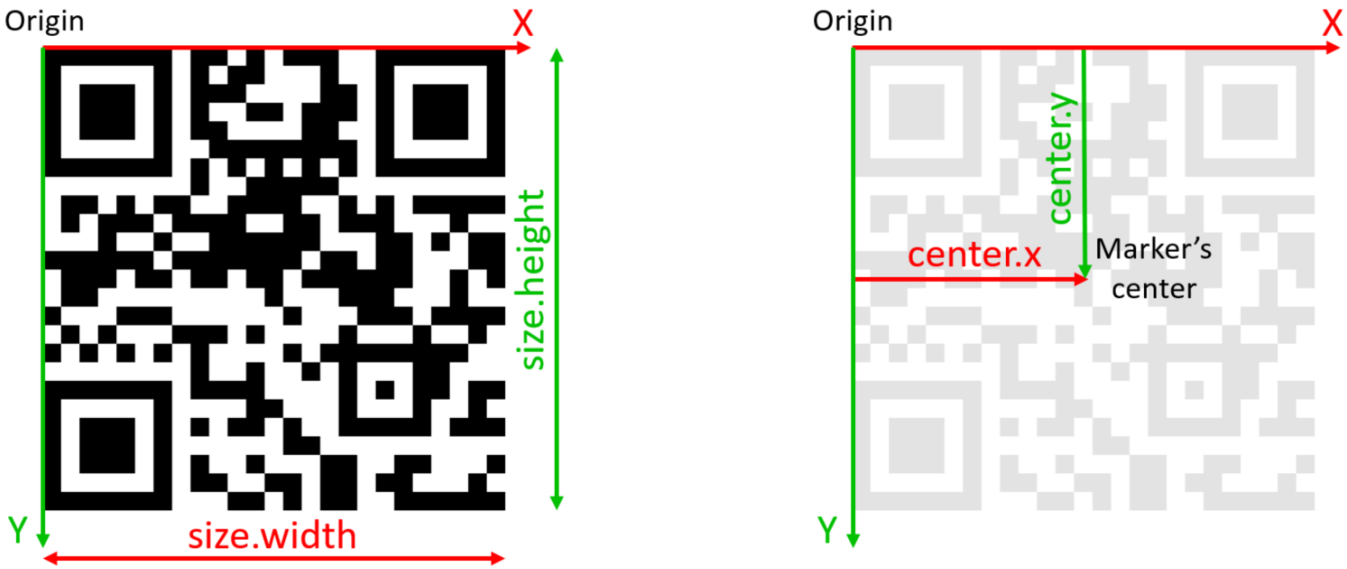

Figure 42. The center and size of QR Code marker.

14.31.5. Retrieving QRCode marker properties

The XrSceneMarkerQRCodesMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_marker
typedef struct XrSceneMarkerQRCodesMSFT {
    XrStructureType             type;
    const void*                 next;
    uint32_t                    qrCodeCapacityInput;
    XrSceneMarkerQRCodeMSFT*    qrCodes;
} XrSceneMarkerQRCodesMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. See also: XrSceneComponentsMSFT, XrSceneMarkersMSFT
- `qrCodeCapacityInput` is a `uint32_t` indicating the count of elements in the `qrCodes` array.
- `qrCodes` is an array of XrSceneMarkerQRCodeMSFT for the runtime to fill with the properties of the QR Codes.

An XrSceneMarkerQRCodesMSFT structure can be chained to the `next` pointer of XrSceneComponentsMSFT when calling xrGetSceneComponentsMSFT function to retrieve the QR Code specific properties through an array of XrSceneMarkerQRCodeMSFT structures.

xrGetSceneComponentsMSFT follows the two-call idiom for filling the XrSceneComponentsMSFT structure to which an XrSceneMarkerQRCodesMSFT structure **can** be chained.

The `qrCodeCapacityInput` **must** be equal to or greater than the corresponding XrSceneComponentsMSFT::componentCapacityInput, otherwise the runtime **must** return the success code `XR_ERROR_SIZE_INSUFFICIENT` from xrGetSceneComponentsMSFT.

The actual count of elements returned in the array `qrCodes` is consistent to the extended XrSceneComponentsMSFT structure and returned in XrSceneComponentsMSFT::componentCountOutput.

Valid Usage (Implicit)

- The XR_MSFT_scene_marker extension **must** be enabled prior to using XrSceneMarkerQRCodesMSFT
- type **must** be XR_TYPE_SCENE_MARKER_QR_CODES_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If qrCodeCapacityInput is not 0, qrCodes **must** be a pointer to an array of qrCodeCapacityInput XrSceneMarkerQRCodeMSFT structures

The XrSceneMarkerQRCodeMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_marker
typedef struct XrSceneMarkerQRCodeMSFT {
    XrSceneMarkerQRCodeSymbolTypeMSFT    symbolType;
    uint8_t                              version;
} XrSceneMarkerQRCodeMSFT;
```

Member Descriptions

- symbolType is an XrSceneMarkerQRCodeSymbolTypeMSFT indicating the symbol type of the QR Code.
- version is a uint8_t indicating the version of the QR Code

The XrSceneMarkerQRCodeMSFT structure contains the detailed QR Code symbol type and version according to ISO/IEC 18004:2015. The version **must** be in the range 1 to 40 inclusively for a QR Code and 1 to 4 inclusively for a Micro QR Code.

Valid Usage (Implicit)

- The XR_MSFT_scene_marker extension **must** be enabled prior to using XrSceneMarkerQRCodeMSFT

```
// Provided by XR_MSFT_scene_marker
typedef enum XrSceneMarkerQRCodeSymbolTypeMSFT {
    XR_SCENE_MARKER_QR_CODE_SYMBOL_TYPE_QR_CODE_MSFT = 1,
    XR_SCENE_MARKER_QR_CODE_SYMBOL_TYPE_MICRO_QR_CODE_MSFT = 2,
    XR_SCENE_MARKER_QRCODE_SYMBOL_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneMarkerQRCodeSymbolTypeMSFT;
```

The XrSceneMarkerQRCodeSymbolTypeMSFT identifies the symbol type of the QR Code.

Enumerant Descriptions

- XR_SCENE_MARKER_QR_CODE_SYMBOL_TYPE_QR_CODE_MSFT if the marker is a QR Code.
- XR_SCENE_MARKER_QR_CODE_SYMBOL_TYPE_MICRO_QR_CODE_MSFT if the marker is a Micro QR Code.

The xrGetSceneMarkerDecodedStringMSFT function is defined as:

```
// Provided by XR_MSFT_scene_marker
XrResult xrGetSceneMarkerDecodedStringMSFT(
    XrSceneMSFT                                 scene,
    const XrUuidMSFT*                           markerId,
    uint32_t                                    bufferCapacityInput,
    uint32_t*                                   bufferCountOutput,
    char*                                       buffer);
```

Parameter Descriptions

- scene is an XrSceneMSFT previously created by xrCreateSceneMSFT.
- markerId is an XrUuidMSFT identifying the marker, returned previously from XrSceneComponentMSFT::id when calling xrGetSceneComponentsMSFT.
- bufferCapacityInput is the capacity of the string buffer, or 0 to indicate a request to retrieve the required capacity.
- bufferCountOutput is a pointer to the count of characters written (including the terminating '\0'), or a pointer to the required capacity in the case that bufferCapacityInput is insufficient.
- buffer is a pointer to an application-allocated buffer that will be filled with the string stored in the QR Code. It can be NULL if bufferCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required buffer size.

The xrGetSceneMarkerDecodedStringMSFT function retrieves the string stored in the scene marker as an UTF-8 string, including the terminating '\0'. This function follows the two-call idiom for filling the buffer array.

If the stored data in the marker is not an encoded string, the runtime **must** return the success code XR_SCENE_MARKER_DATA_NOT_STRING_MSFT, set bufferCountOutput to 1, and make buffer an empty string.

Valid Usage (Implicit)

- The `XR_MSFT_scene_marker` extension **must** be enabled prior to calling xrGetSceneMarkerDecodedStringMSFT
- `scene` **must** be a valid XrSceneMSFT handle
- `markerId` **must** be a pointer to a valid XrUuidMSFT structure
- `bufferCountOutput` **must** be a pointer to a `uint32_t` value
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` char values

Return Codes

Success

- `XR_SUCCESS`
- `XR_SCENE_MARKER_DATA_NOT_STRING_MSFT`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SCENE_COMPONENT_ID_INVALID_MSFT`
- `XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SIZE_INSUFFICIENT`
- `XR_ERROR_VALIDATION_FAILURE`

The xrGetSceneMarkerRawDataMSFT function is defined as:

```
// Provided by XR_MSFT_scene_marker
XrResult xrGetSceneMarkerRawDataMSFT(
    XrSceneMSFT                                 scene,
    const XrUuidMSFT*                           markerId,
    uint32_t                                    bufferCapacityInput,
    uint32_t*                                   bufferCountOutput,
    uint8_t*                                    buffer);
```

Parameter Descriptions

- `scene` is an XrSceneMSFT previously created by xrCreateSceneMSFT.
- `markerId` is an XrUuidMSFT identifying the marker, and it is returned previous from XrSceneComponentMSFT when calling xrGetSceneComponentsMSFT.
- `bufferCapacityInput` is the capacity of the buffer, or 0 to indicate a request to retrieve the required capacity.
- `bufferCountOutput` is a pointer to the count of bytes written, or a pointer to the required capacity in the case that bufferCapacityInput is insufficient.
- `buffer` is a pointer to an application-allocated buffer that will be filled with the data stored in the QR Code. It can be NULL if bufferCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `buffer` size.

The xrGetSceneMarkerRawDataMSFT function retrieves the data stored in the scene marker.

Valid Usage (Implicit)

- The `XR_MSFT_scene_marker` extension **must** be enabled prior to calling xrGetSceneMarkerRawDataMSFT
- `scene` **must** be a valid XrSceneMSFT handle
- `markerId` **must** be a pointer to a valid XrUuidMSFT structure
- `bufferCountOutput` **must** be a pointer to a `uint32_t` value
- If `bufferCapacityInput` is not `0`, `buffer` **must** be a pointer to an array of `bufferCapacityInput` `uint8_t` values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SCENE_COMPONENT_ID_INVALID_MSFT
- XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

New Object Types

New Flag Types

New Enum Constants

XrSceneComputeFeatureMSFT enumeration is extended with:

- XR_SCENE_COMPUTE_FEATURE_MARKER_MSFT

XrSceneComponentTypeMSFT enumeration is extended with:

Overview

Scene understanding provides applications with a structured, high-level representation of the planes, meshes, and objects in the user's environment, enabling the development of spatially-aware applications.

The application requests computation of a scene, receiving the list of scene components observed in the environment around the user. These scene components contain information such as:

- The type of the discovered objects (wall, floor, ceiling, or other surface type).
- The planes and their bounds that represent the object.
- The visual and collider triangle meshes that represent the object.

The application can use this information to reason about the structure and location of the environment, to place holograms on surfaces, or render clues for grounding objects.

An application typically uses this extension in the following steps:

1. Create an XrSceneObserverMSFT handle to manage the system resource of the scene understanding compute.
2. Start the scene compute by calling xrComputeNewSceneMSFT with XrSceneBoundsMSFT to specify the scan range and a list of XrSceneComputeFeatureMSFT features.
3. Inspect the completion of computation by polling xrGetSceneComputeStateMSFT.
4. Once compute is completed, create an XrSceneMSFT handle to the result by calling xrCreateSceneMSFT.
5. Get properties of scene components using xrGetSceneComponentsMSFT.

6. Locate scene components using xrLocateSceneComponentsMSFT.

Create a scene observer handle

The XrSceneObserverMSFT handle represents the resources for computing scenes. It maintains a correlation of scene component identifiers across multiple scene computes.

Note

The application should destroy the XrSceneObserverMSFT handle when it is done with scene compute and scene component data to save system power consumption.

```
// Provided by XR_MSFT_scene_understanding

            XR_DEFINE_HANDLE(XrSceneObserverMSFT)
```

An XrSceneObserverMSFT handle is created using xrCreateSceneObserverMSFT.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrCreateSceneObserverMSFT(
    XrSession                                   session,
    const XrSceneObserverCreateInfoMSFT*        createInfo,
    XrSceneObserverMSFT*                        sceneObserver);
```

Parameter Descriptions

- `session` is an XrSession in which the scene observer will be active.
- `createInfo` exists for extensibility purposes, it is `NULL` or a pointer to a valid XrSceneObserverCreateInfoMSFT structure.
- `sceneObserver` is the returned XrSceneObserverMSFT handle.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to calling xrCreateSceneObserverMSFT
- `session` **must** be a valid XrSession handle
- If `createInfo` is not `NULL`, `createInfo` **must** be a pointer to a valid XrSceneObserverCreateInfoMSFT structure
- `sceneObserver` **must** be a pointer to an XrSceneObserverMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSceneObserverCreateInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneObserverCreateInfoMSFT {
    XrStructureType    type;
    const void*        next;
} XrSceneObserverCreateInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneObserverCreateInfoMSFT
- type **must** be XR_TYPE_SCENE_OBSERVER_CREATE_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrDestroySceneObserverMSFT function releases the sceneObserver and the underlying resources.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrDestroySceneObserverMSFT(
    XrSceneObserverMSFT                         sceneObserver);
```

Parameter Descriptions

- sceneObserver is an XrSceneObserverMSFT previously created by xrCreateSceneObserverMSFT.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to calling xrDestroySceneObserverMSFT
- sceneObserver **must** be a valid XrSceneObserverMSFT handle

Thread Safety

- Access to sceneObserver, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Compute a new scene and wait for completion

The xrComputeNewSceneMSFT function begins the compute of a new scene and the runtime **must** return quickly without waiting for the compute to complete. The application **should** use xrGetSceneComputeStateMSFT to inspect the compute status.

The application **can** control the compute features by passing a list of XrSceneComputeFeatureMSFT via XrNewSceneComputeInfoMSFT::requestedFeatures.

- If XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT is passed, but XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT is not passed, then:
  - The application **may** be able to read XR_SCENE_COMPONENT_TYPE_PLANE_MSFT and XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT scene components from the resulting XrSceneMSFT handle.
  - XrScenePlaneMSFT::meshBufferId **must** be zero to indicate that the plane scene component does not have a mesh buffer available to read.
- If XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT and XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT are passed, then:
  - the application **may** be able to read XR_SCENE_COMPONENT_TYPE_PLANE_MSFT and XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT scene components from the resulting XrSceneMSFT handle
  - XrScenePlaneMSFT::meshBufferId **may** contain a non-zero mesh buffer identifier to indicate that the plane scene component has a mesh buffer available to read.
- If XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT is passed then:
  - the application **may** be able to read XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT and XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT scene components from the resulting XrSceneMSFT handle.
- If XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT is passed then:
  - the application **may** be able to read XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT and XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT scene components from the resulting XrSceneMSFT handle.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrComputeNewSceneMSFT(
    XrSceneObserverMSFT                         sceneObserver,
    const XrNewSceneComputeInfoMSFT*            computeInfo);
```

Parameter Descriptions

- sceneObserver is a handle to an XrSceneObserverMSFT.
- computeInfo is a pointer to an XrNewSceneComputeInfoMSFT structure.

The runtime **must** return XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT if incompatible features were passed or no compatible features were passed.

The runtime **must** return XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT if XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT was passed but XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT was not passed.

The runtime **must** return XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT if xrComputeNewSceneMSFT is called while the scene computation is in progress.

An application that wishes to use XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT **must** create an XrSceneObserverMSFT handle that passes neither XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_COMPLETE_MSFT nor XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_INCOMPLETE_FAST_MSFT to xrComputeNewSceneMSFT for the lifetime of that XrSceneObserverMSFT handle. This allows the runtime to return occlusion mesh at a different cadence than non-occlusion mesh or planes.

- The runtime **must** return XR_ERROR_SCENE_COMPUTE_CONSISTENCY_MISMATCH_MSFT if:
  - XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT is passed to xrComputeNewSceneMSFT **and**
  - a previous call to xrComputeNewSceneMSFT did not pass XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT for the same XrSceneObserverMSFT handle.
- The runtime **must** return XR_ERROR_SCENE_COMPUTE_CONSISTENCY_MISMATCH_MSFT if:
  - XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT is not passed to xrComputeNewSceneMSFT **and**
  - a previous call to xrComputeNewSceneMSFT did pass XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT for the same XrSceneObserverMSFT handle.
- The runtime **must** return XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT if:
  - XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT is passed to xrComputeNewSceneMSFT **and**
  - neither XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT nor XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT are also passed.
- The runtime **must** return XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT if:
  - XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT is passed to xrComputeNewSceneMSFT **and**
  - at least one of XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT, XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT, XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT, or XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT are also passed.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to calling xrComputeNewSceneMSFT
- `sceneObserver` **must** be a valid XrSceneObserverMSFT handle
- `computeInfo` **must** be a pointer to a valid XrNewSceneComputeInfoMSFT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT`
- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SCENE_COMPUTE_CONSISTENCY_MISMATCH_MSFT`
- `XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

An XrSceneMSFT handle represents the collection of scene components that were detected during the scene computation.

```
// Provided by XR_MSFT_scene_understanding

            XR_DEFINE_HANDLE(XrSceneMSFT)
```

The XrNewSceneComputeInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrNewSceneComputeInfoMSFT {
    XrStructureType                       type;
    const void*                           next;
    uint32_t                              requestedFeatureCount;
    const XrSceneComputeFeatureMSFT*      requestedFeatures;
    XrSceneComputeConsistencyMSFT         consistency;
    XrSceneBoundsMSFT                     bounds;
} XrNewSceneComputeInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `requestedFeatureCount` is the number of features.
- `requestedFeatures` is an array of XrSceneComputeFeatureMSFT.
- `consistency` indicates the requested XrSceneComputeConsistencyMSFT, trading off speed against the quality of the resulting scene.
- `bounds` is an XrSceneBoundsMSFT representing the culling volume. Scene components entirely outside this volume **should** culled.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrNewSceneComputeInfoMSFT
- `type` **must** be `XR_TYPE_NEW_SCENE_COMPUTE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrVisualMeshComputeLodInfoMSFT
- `requestedFeatures` **must** be a pointer to an array of `requestedFeatureCount` valid XrSceneComputeFeatureMSFT values
- `consistency` **must** be a valid XrSceneComputeConsistencyMSFT value
- `bounds` **must** be a valid XrSceneBoundsMSFT structure
- The `requestedFeatureCount` parameter **must** be greater than `0`

The XrSceneComputeFeatureMSFT enumeration identifies the different scene compute features that may be passed to xrComputeNewSceneMSFT.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrSceneComputeFeatureMSFT {
    XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT = 1,
    XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT = 2,
    XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT = 3,
    XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT = 4,
  // Provided by XR_MSFT_scene_understanding_serialization
    XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT = 1000098000,
  // Provided by XR_MSFT_scene_marker
    XR_SCENE_COMPUTE_FEATURE_MARKER_MSFT = 1000147000,
    XR_SCENE_COMPUTE_FEATURE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneComputeFeatureMSFT;
```

Enumerant Descriptions

- `XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT` specifies that plane data for objects should be included in the resulting scene.
- `XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT` specifies that planar meshes for objects should be included in the resulting scene.
- `XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT` specifies that 3D visualization meshes for objects should be included in the resulting scene.
- `XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT` specifies that 3D collider meshes for objects should be included in the resulting scene.

Note

Applications wanting to use the scene for analysis, or in a physics simulation should set `consistency` to `XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_COMPLETE_MSFT` in order to avoid physics objects falling through the gaps and escaping the scene.

Setting `consistency` to `XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_INCOMPLETE_FAST_MSFT` might speed up the compute but it will result in gaps in the scene.

Setting `consistency` to `XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT` should be done when the resulting mesh will only be used to occlude virtual objects that are behind real-world surfaces. This mode will be most efficient and have the lowest-latency, but will return meshes less suitable for analysis or visualization.

The XrSceneComputeConsistencyMSFT enumeration identifies the different scene compute consistencies that may be passed to xrComputeNewSceneMSFT.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrSceneComputeConsistencyMSFT {
    XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_COMPLETE_MSFT = 1,
    XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_INCOMPLETE_FAST_MSFT = 2,
    XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT = 3,
    XR_SCENE_COMPUTE_CONSISTENCY_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneComputeConsistencyMSFT;
```

Enumerant Descriptions

- XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_COMPLETE_MSFT. The runtime **must** return a scene that is a consistent and complete snapshot of the environment, inferring the size and shape of objects as needed where the objects were not directly observed, in order to generate a watertight representation of the scene.
- XR_SCENE_COMPUTE_CONSISTENCY_SNAPSHOT_INCOMPLETE_FAST_MSFT. The runtime **must** return a consistent snapshot of the scene with meshes that do not overlap adjacent meshes at their edges, but **may** skip returning objects with XrSceneObjectTypeMSFT of XR_SCENE_OBJECT_TYPE_INFERRED_MSFT in order to return the scene faster.
- XR_SCENE_COMPUTE_CONSISTENCY_OCCLUSION_OPTIMIZED_MSFT. The runtime **may** react to this value by computing scenes more quickly and reusing existing mesh buffer IDs more often to minimize app overhead, with potential tradeoffs such as returning meshes that are not watertight, meshes that overlap adjacent meshes at their edges to allow partial updates in the future, or other reductions in mesh quality that are less observable when mesh is used for occlusion only.

An application **can** pass one or more bounding volumes when calling xrComputeNewSceneMSFT. These bounding volumes are used to determine which scene components to include in the resulting scene. Scene components that intersect one or more of the bounding volumes **should** be included, and all other scene components **should** be excluded. If an application inputs no bounding volumes, then the runtime **must** not associate any scene components with the resulting XrSceneMSFT handle.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneBoundsMSFT {
    XrSpace                                 space;
    XrTime                                  time;
    uint32_t                                sphereCount;
    const XrSceneSphereBoundMSFT*           spheres;
    uint32_t                                boxCount;
    const XrSceneOrientedBoxBoundMSFT*      boxes;
    uint32_t                                frustumCount;
    const XrSceneFrustumBoundMSFT*          frustums;
} XrSceneBoundsMSFT;
```

Member Descriptions

- `space` is a handle to the XrSpace in which the bounds are specified.
- `time` is the `XrTime` at which the bounds will be evaluated within `space`.
- `sphereCount` is the number of sphere bounds.
- `spheres` is an array of XrSceneSphereBoundMSFT.
- `boxCount` is the number of oriented box bounds.
- `boxes` is an array of XrSceneOrientedBoxBoundMSFT.
- `frustumCount` is the number of frustum bounds.
- `frustums` is an array of XrSceneFrustumBoundMSFT.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneBoundsMSFT
- `space` **must** be a valid XrSpace handle
- If `sphereCount` is not `0`, `spheres` **must** be a pointer to an array of `sphereCount` XrSceneSphereBoundMSFT structures
- If `boxCount` is not `0`, `boxes` **must** be a pointer to an array of `boxCount` XrSceneOrientedBoxBoundMSFT structures
- If `frustumCount` is not `0`, `frustums` **must** be a pointer to an array of `frustumCount` XrSceneFrustumBoundMSFT structures

An XrSceneSphereBoundMSFT structure describes the center and radius of a sphere bounds.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneSphereBoundMSFT {
    XrVector3f    center;
    float         radius;
} XrSceneSphereBoundMSFT;
```

Member Descriptions

- `center` is an XrVector3f representing the center of the sphere bound within the reference frame of the corresponding XrSceneBoundsMSFT::`space`.
- `radius` is the finite positive radius of the sphere bound.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if `radius` is not a finite positive value.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneSphereBoundMSFT

An XrSceneOrientedBoxBoundMSFT structure describes the pose and extents of an oriented box bounds.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneOrientedBoxBoundMSFT {
    XrPosef       pose;
    XrVector3f    extents;
} XrSceneOrientedBoxBoundMSFT;
```

Member Descriptions

- `pose` is an XrPosef defining the center position and orientation of the oriented bounding box bound within the reference frame of the corresponding XrSceneBoundsMSFT::`space`.
- `extents` is an XrVector3f defining the edge-to-edge length of the box along each dimension with `pose` as the center.

The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if any component of `extents` is not finite or less than or equal to zero.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneOrientedBoxBoundMSFT

An XrSceneFrustumBoundMSFT structure describes the pose, field of view, and far distance of a frustum bounds.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneFrustumBoundMSFT {
    XrPosef    pose;
    XrFovf     fov;
    float      farDistance;
} XrSceneFrustumBoundMSFT;
```

Member Descriptions

- pose is an XrPosef defining the position and orientation of the tip of the frustum bound within the reference frame of the corresponding XrSceneBoundsMSFT::space.
- fov is an XrFovf for the four sides of the frustum bound where XrFovf::angleLeft and XrFovf ::angleRight are along the X axis and XrFovf::angleUp and XrFovf::angleDown are along the Y axis of the frustum bound space.
- farDistance is the positive distance of the far plane of the frustum bound along the -Z direction of the frustum bound space.

The runtime **must** return XR_ERROR_VALIDATION_FAILURE if farDistance is less than or equal to zero. The runtime **must** return XR_ERROR_VALIDATION_FAILURE if the fov angles are not between between -π/2 and π/2 exclusively.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneFrustumBoundMSFT

Applications **can** request a desired visual mesh level of detail by including XrVisualMeshComputeLodInfoMSFT in the XrNewSceneComputeInfoMSFT::next chain. If XrVisualMeshComputeLodInfoMSFT is not included in the XrNewSceneComputeInfoMSFT::next chain, then XR_MESH_COMPUTE_LOD_COARSE_MSFT **must** be used for the visual mesh level of detail.

The XrVisualMeshComputeLodInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrVisualMeshComputeLodInfoMSFT {
    XrStructureType         type;
    const void*             next;
    XrMeshComputeLodMSFT    lod;
} XrVisualMeshComputeLodInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `lod` is the requested mesh level of detail specified by XrMeshComputeLodMSFT.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrVisualMeshComputeLodInfoMSFT
- `type` **must** be `XR_TYPE_VISUAL_MESH_COMPUTE_LOD_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `lod` **must** be a valid XrMeshComputeLodMSFT value

The XrMeshComputeLodMSFT enumeration identifies the level of detail of visual mesh compute.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrMeshComputeLodMSFT {
    XR_MESH_COMPUTE_LOD_COARSE_MSFT = 1,
    XR_MESH_COMPUTE_LOD_MEDIUM_MSFT = 2,
    XR_MESH_COMPUTE_LOD_FINE_MSFT = 3,
    XR_MESH_COMPUTE_LOD_UNLIMITED_MSFT = 4,
    XR_MESH_COMPUTE_LOD_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrMeshComputeLodMSFT;
```

Enumerant Descriptions

- XR_MESH_COMPUTE_LOD_COARSE_MSFT. Coarse mesh compute level of detail will generate roughly 100 triangles per cubic meter.
- XR_MESH_COMPUTE_LOD_MEDIUM_MSFT. Medium mesh compute level of detail will generate roughly 400 triangles per cubic meter.
- XR_MESH_COMPUTE_LOD_FINE_MSFT. Fine mesh compute level of detail will generate roughly 2000 triangles per cubic meter.
- XR_MESH_COMPUTE_LOD_UNLIMITED_MSFT. Unlimited mesh compute level of detail. There is no guarantee as to the number of triangles returned.

The xrEnumerateSceneComputeFeaturesMSFT function enumerates the supported scene compute features of the given system.

This function follows the two-call idiom for filling the features array.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrEnumerateSceneComputeFeaturesMSFT(
    XrInstance                                  instance,
    XrSystemId                                  systemId,
    uint32_t                                    featureCapacityInput,
    uint32_t*                                   featureCountOutput,
    XrSceneComputeFeatureMSFT*                  features);
```

Parameter Descriptions

- instance is a handle to an XrInstance.
- systemId is the XrSystemId whose scene compute features will be enumerated.
- featureCapacityInput is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- featureCountOutput is a pointer to the count of scene compute features, or a pointer to the required capacity in the case that featureCapacityInput is insufficient.
- features is an array of XrSceneComputeFeatureMSFT.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to calling xrEnumerateSceneComputeFeaturesMSFT
- instance **must** be a valid XrInstance handle
- featureCountOutput **must** be a pointer to a uint32_t value
- If featureCapacityInput is not 0, features **must** be a pointer to an array of featureCapacityInput XrSceneComputeFeatureMSFT values

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_SYSTEM_INVALID
- XR_ERROR_VALIDATION_FAILURE

An application **can** inspect the completion of the compute by polling xrGetSceneComputeStateMSFT. This function **should** typically be called once per frame per XrSceneObserverMSFT.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrGetSceneComputeStateMSFT(
    XrSceneObserverMSFT                         sceneObserver,
    XrSceneComputeStateMSFT*                    state);
```

Parameter Descriptions

- sceneObserver is a handle to an XrSceneObserverMSFT.
- state is the returned XrSceneComputeStateMSFT value.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to calling xrGetSceneComputeStateMSFT
- `sceneObserver` **must** be a valid XrSceneObserverMSFT handle
- `state` **must** be a pointer to an XrSceneComputeStateMSFT value

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

XrSceneComputeStateMSFT identifies the different states of computing a new scene.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrSceneComputeStateMSFT {
    XR_SCENE_COMPUTE_STATE_NONE_MSFT = 0,
    XR_SCENE_COMPUTE_STATE_UPDATING_MSFT = 1,
    XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT = 2,
    XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT = 3,
    XR_SCENE_COMPUTE_STATE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneComputeStateMSFT;
```

Enumerant Descriptions

- XR_SCENE_COMPUTE_STATE_NONE_MSFT indicates that no scene is available, and that a scene is not being computed. The application **may** call xrComputeNewSceneMSFT to start computing a scene.
- XR_SCENE_COMPUTE_STATE_UPDATING_MSFT indicates that a new scene is being computed. Calling xrCreateSceneMSFT or xrComputeNewSceneMSFT **must** return the error XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT.
- XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT indicates that a new scene has completed computing. The application **may** call xrCreateSceneMSFT to get the results of the query or the application **may** call xrComputeNewSceneMSFT to start computing a new scene.
- XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT indicates that the new scene computation completed with an error. Calling xrCreateSceneMSFT **must** return a valid XrSceneMSFT handle but calling xrGetSceneComponentsMSFT with that handle **must** return zero scene components. The runtime **must** allow the application to call xrComputeNewSceneMSFT to try computing a scene again, even if the last call to xrComputeNewSceneMSFT resulted in XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT.

- The xrGetSceneComputeStateMSFT function **must** return XR_SCENE_COMPUTE_STATE_NONE_MSFT if it is called before xrComputeNewSceneMSFT is called for the first time for the given XrSceneObserverMSFT handle.
- After calling xrComputeNewSceneMSFT but before the asynchronous operation has completed, any calls to xrGetSceneComputeStateMSFT **should** return XR_SCENE_COMPUTE_STATE_UPDATING_MSFT.
- Once the asynchronous operation has completed successfully, xrGetSceneComputeStateMSFT **must** return XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT until xrComputeNewSceneMSFT is called again.

Create a scene handle after a new scene compute has completed

The xrCreateSceneMSFT functions creates an XrSceneMSFT handle. It can only be called after xrGetSceneComputeStateMSFT returns XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT to indicate that the asynchronous operation has completed. The XrSceneMSFT handle manages the collection of scene components that represents the detected objects found during the query.

After an XrSceneMSFT handle is created, the handle and associated data **must** remain valid until destroyed, even after xrCreateSceneMSFT is called again to create the next scene. The runtime **must** keep alive any component data and mesh buffers relating to this historical scene until its handle is destroyed.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrCreateSceneMSFT(
    XrSceneObserverMSFT                         sceneObserver,
    const XrSceneCreateInfoMSFT*                createInfo,
    XrSceneMSFT*                                scene);
```

Parameter Descriptions

- `sceneObserver` is a handle to an XrSceneObserverMSFT.
- `createInfo` exists for extensibility purposes, it is `NULL` or a pointer to a valid XrSceneCreateInfoMSFT structure.
- `scene` is the returned XrSceneMSFT handle.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to calling xrCreateSceneMSFT
- `sceneObserver` **must** be a valid XrSceneObserverMSFT handle
- If `createInfo` is not `NULL`, `createInfo` **must** be a pointer to a valid XrSceneCreateInfoMSFT structure
- `scene` **must** be a pointer to an XrSceneMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

Calling xrCreateSceneMSFT when xrGetSceneComputeStateMSFT returns XR_SCENE_COMPUTE_STATE_NONE_MSFT or XR_SCENE_COMPUTE_STATE_UPDATING_MSFT **must** return the error XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT.

The XrSceneCreateInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneCreateInfoMSFT {
    XrStructureType    type;
    const void*        next;
} XrSceneCreateInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneCreateInfoMSFT
- type **must** be XR_TYPE_SCENE_CREATE_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain

The xrDestroySceneMSFT function releases the scene and the underlying resources.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrDestroySceneMSFT(
    XrSceneMSFT                                 scene);
```

Parameter Descriptions

- scene is an XrSceneMSFT previously created by xrCreateSceneMSFT.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to calling xrDestroySceneMSFT
- scene **must** be a valid XrSceneMSFT handle

Thread Safety

- Access to scene, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Scene component types and Universally Unique Identifiers

Each XrSceneMSFT may contain one or more scene components. Scene components are uniquely identified by a Universally Unique Identifier, represented by XrUuidMSFT. Each scene component belongs to one XrSceneComponentTypeMSFT. The XrSceneComponentTypeMSFT denotes which additional properties can be read for that scene component.

- Get a list of scene objects and their properties in the scene by calling xrGetSceneComponentsMSFT with XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT and including XrSceneObjectsMSFT in the XrSceneComponentsMSFT::next chain.
- Get the list of scene planes and their properties in the scene if XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT was passed to xrComputeNewSceneMSFT by calling xrGetSceneComponentsMSFT with XR_SCENE_COMPONENT_TYPE_PLANE_MSFT and including XrScenePlanesMSFT in the XrSceneComponentsMSFT::next chain.
- Get the list of scene visual meshes and their properties in the scene if XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT was passed to xrComputeNewSceneMSFT by calling xrGetSceneComponentsMSFT with XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT and including XrSceneMeshesMSFT in the XrSceneComponentsMSFT::next chain.
- Get the list of scene collider meshes and their properties in the scene if XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT was passed to xrComputeNewSceneMSFT by calling xrGetSceneComponentsMSFT with XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT and including XrSceneMeshesMSFT in the XrSceneComponentsMSFT::next chain.

The XrUuidMSFT structure is a 128-bit UUID (Universally Unique IDentifier) that follows RFC 4122 Variant 1. The structure is composed of 16 octets, typically with the sizes and order of the fields defined in RFC 4122 section 4.1.2. The XrUuidMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrUuidMSFT {
    uint8_t    bytes[16];
} XrUuidMSFT;
```

Member Descriptions

- bytes is a 128-bit Variant-1 Universally Unique Identifier.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrUuidMSFT

The XrSceneComponentTypeMSFT enumeration identifies the scene component type.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrSceneComponentTypeMSFT {
    XR_SCENE_COMPONENT_TYPE_INVALID_MSFT = -1,
    XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT = 1,
    XR_SCENE_COMPONENT_TYPE_PLANE_MSFT = 2,
    XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT = 3,
    XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT = 4,
  // Provided by XR_MSFT_scene_understanding_serialization
    XR_SCENE_COMPONENT_TYPE_SERIALIZED_SCENE_FRAGMENT_MSFT = 1000098000,
  // Provided by XR_MSFT_scene_marker
    XR_SCENE_COMPONENT_TYPE_MARKER_MSFT = 1000147000,
    XR_SCENE_COMPONENT_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneComponentTypeMSFT;
```

Enumerant Descriptions

- XR_SCENE_COMPONENT_TYPE_INVALID_MSFT indicates an invalid scene component type.
- XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT indicates a discrete object detected in the world, such as a wall, floor, ceiling or table. Scene objects then provide their geometric representations such as planes and meshes as child scene components with the types below.
- XR_SCENE_COMPONENT_TYPE_PLANE_MSFT indicates a flat 2D representation of a surface in the world, such as a wall, floor, ceiling or table.
- XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT indicates a visual mesh representation of an object in the world, optimized for visual quality when directly rendering a wireframe or other mesh visualization to the user. Visual mesh can also be used for rendering the silhouettes of objects. Applications can request varying levels of detail for visual meshes when calling xrComputeNewSceneMSFT using XrVisualMeshComputeLodInfoMSFT.
- XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT indicates a collider mesh representation of an object in the world, optimized to maintain the silhouette of an object while reducing detail on mostly-flat surfaces. Collider mesh is useful when calculating physics collisions or when rendering silhouettes of objects for occlusion.

Get scene components

Scene components are read from an XrSceneMSFT using xrGetSceneComponentsMSFT and passing one XrSceneComponentTypeMSFT. This function follows the two-call idiom for filling multiple buffers in a struct. Different scene component types **may** have additional properties that **can** be read by chaining additional structures to XrSceneComponentsMSFT. Those additional structures **must** have an array size that is at least as large as XrSceneComponentsMSFT::componentCapacityInput, otherwise the runtime **must** return XR_ERROR_SIZE_INSUFFICIENT.

- If XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT is passed to xrGetSceneComponentsMSFT, then

XrSceneObjectsMSFT may be included in the XrSceneComponentsMSFT::next chain.

- If XR_SCENE_COMPONENT_TYPE_PLANE_MSFT is passed to xrGetSceneComponentsMSFT, then XrScenePlanesMSFT may be included in the XrSceneComponentsMSFT::next chain.
- If XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT or XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT are passed to xrGetSceneComponentsMSFT, then XrSceneMeshesMSFT may be included in the XrSceneComponentsMSFT::next chain.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrGetSceneComponentsMSFT(
    XrSceneMSFT                                 scene,
    const XrSceneComponentsGetInfoMSFT*         getInfo,
    XrSceneComponentsMSFT*                      components);
```

Parameter Descriptions

- scene is an XrSceneMSFT previously created by xrCreateSceneMSFT.
- getInfo is a pointer to an XrSceneComponentsGetInfoMSFT structure.
- components is the XrSceneComponentsMSFT output structure.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to calling xrGetSceneComponentsMSFT
- scene **must** be a valid XrSceneMSFT handle
- getInfo **must** be a pointer to a valid XrSceneComponentsGetInfoMSFT structure
- components **must** be a pointer to an XrSceneComponentsMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

An application **can** use XrSceneComponentsGetInfoMSFT to read the state of a specific component type using the xrGetSceneComponentsMSFT function. Applications can chain one or more of following extension structures to the XrSceneComponentsGetInfoMSFT::next chain to further narrow the returned components. The returned components **must** satisfy all conditions in the extension structs.

- XrSceneComponentParentFilterInfoMSFT to return only scene components that match the given parent object identifier.
- XrSceneObjectTypesFilterInfoMSFT to return only scene components that match any of the given XrSceneObjectTypeMSFT values or if a scene component does not have an XrSceneObjectTypeMSFT property then the parent's XrSceneObjectTypeMSFT property will be compared.
- XrScenePlaneAlignmentFilterInfoMSFT to return only scene components that match any of the given XrScenePlaneAlignmentTypeMSFT values.

The XrSceneComponentsGetInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentsGetInfoMSFT {
    XrStructureType             type;
    const void*                 next;
    XrSceneComponentTypeMSFT    componentType;
} XrSceneComponentsGetInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `componentType` is the scene component type requested.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentsGetInfoMSFT
- `type` **must** be `XR_TYPE_SCENE_COMPONENTS_GET_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSceneComponentParentFilterInfoMSFT, XrSceneMarkerTypeFilterMSFT, XrSceneObjectTypesFilterInfoMSFT, XrScenePlaneAlignmentFilterInfoMSFT
- `componentType` **must** be a valid XrSceneComponentTypeMSFT value

The XrSceneComponentsMSFT structure contains an array of XrSceneComponentMSFT returning the components that satisfy the conditions in xrGetSceneComponentsMSFT::`getInfo`. The XrSceneComponentsMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentsMSFT {
    XrStructureType          type;
    void*                    next;
    uint32_t                 componentCapacityInput;
    uint32_t                 componentCountOutput;
    XrSceneComponentMSFT*    components;
} XrSceneComponentsMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `componentCapacityInput` is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- `componentCountOutput` is a pointer to the count of components, or a pointer to the required capacity in the case that `componentCapacityInput` is insufficient.
- `components` is an array of XrSceneComponentMSFT.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `components` size.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentsMSFT
- `type` **must** be `XR_TYPE_SCENE_COMPONENTS_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain. See also: XrSceneMarkerQRCodesMSFT, XrSceneMarkersMSFT, XrSceneMeshesMSFT, XrSceneObjectsMSFT, XrScenePlanesMSFT
- If `componentCapacityInput` is not `0`, `components` **must** be a pointer to an array of `componentCapacityInput` XrSceneComponentMSFT structures

The XrSceneComponentMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentMSFT {
    XrSceneComponentTypeMSFT    componentType;
    XrUuidMSFT                  id;
    XrUuidMSFT                  parentId;
    XrTime                      updateTime;
} XrSceneComponentMSFT;
```

Member Descriptions

- `componentType` is the XrSceneComponentTypeMSFT of the scene component.
- `id` is the XrUuidMSFT of the scene component.
- `parentId` is the XrUuidMSFT of the parent scene object. If the scene component does not have a parent, then `parentId` will be equal to zero.
- `updateTime` is the `XrTime` that this scene component was last updated.

The runtime **must** set `parentId` to either zero or a valid XrUuidMSFT that corresponds to a scene component of type `XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT` that exists in the XrSceneMSFT.

Note

The parent scene object is intended to allow scene components to be grouped. For example, the scene object for a wall might have multiple scene component children like `XR_SCENE_COMPONENT_TYPE_PLANE_MSFT`, `XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT`, and `XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT`. Those child scene components would be alternative representations of the same wall.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentMSFT
- `componentType` **must** be a valid XrSceneComponentTypeMSFT value

Get scene components using filters

The scene components that are returned by xrGetSceneComponentsMSFT **can** be filtered by chaining optional structures to XrSceneComponentsGetInfoMSFT. The runtime **must** combine multiple filters with a logical AND.

The XrSceneComponentParentFilterInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentParentFilterInfoMSFT {
    XrStructureType    type;
    const void*        next;
    XrUuidMSFT         parentId;
} XrSceneComponentParentFilterInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `parentId` is the XrUuidMSFT of the parent scene component to filter by.

The runtime **must** return only scene components with matching `parentId`. If `parentId` is zero then the runtime **must** return only scene components that do not have a parent.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentParentFilterInfoMSFT
- `type` **must** be `XR_TYPE_SCENE_COMPONENT_PARENT_FILTER_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

The XrSceneObjectTypesFilterInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneObjectTypesFilterInfoMSFT {
    XrStructureType                 type;
    const void*                     next;
    uint32_t                        objectTypeCount;
    const XrSceneObjectTypeMSFT*    objectTypes;
} XrSceneObjectTypesFilterInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `objectTypeCount` is a `uint32_t` describing the count of elements in the `objectTypes` array.
- `objectTypes` is an array of XrSceneObjectTypeMSFT to filter by.

The runtime **must** return only scene components that match any of the XrSceneObjectTypeMSFT in `objectTypes`. If a scene component does not have an XrSceneObjectTypeMSFT then the parent's XrSceneObjectTypeMSFT value will be used for the comparison if it exists.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneObjectTypesFilterInfoMSFT
- type **must** be XR_TYPE_SCENE_OBJECT_TYPES_FILTER_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If objectTypeCount is not 0, objectTypes **must** be a pointer to an array of objectTypeCount valid XrSceneObjectTypeMSFT values

The XrScenePlaneAlignmentFilterInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrScenePlaneAlignmentFilterInfoMSFT {
    XrStructureType                         type;
    const void*                             next;
    uint32_t                                alignmentCount;
    const XrScenePlaneAlignmentTypeMSFT*    alignments;
} XrScenePlaneAlignmentFilterInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.
- alignmentCount is a uint32_t describing the count of elements in the alignments array.
- alignments is an array of XrScenePlaneAlignmentTypeMSFT to filter by.

The runtime **must** return only scene components that match one of the XrScenePlaneAlignmentTypeMSFT values passed in alignments.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrScenePlaneAlignmentFilterInfoMSFT
- type **must** be XR_TYPE_SCENE_PLANE_ALIGNMENT_FILTER_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If alignmentCount is not 0, alignments **must** be a pointer to an array of alignmentCount valid XrScenePlaneAlignmentTypeMSFT values

Get scene objects

The runtime **must** fill out the XrSceneObjectsMSFT structure when included in the XrSceneComponentsMSFT::`next` chain. The XrSceneComponentsGetInfoMSFT::componentType **must** be `XR_SCENE_COMPONENT_TYPE_OBJECT_MSFT` when XrSceneObjectsMSFT is included in the next chain. If it is not, the `XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT` error **must** be returned.

The XrSceneObjectsMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneObjectsMSFT {
    XrStructureType       type;
    void*                 next;
    uint32_t              sceneObjectCount;
    XrSceneObjectMSFT*    sceneObjects;
} XrSceneObjectsMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `sceneObjectCount` is a `uint32_t` describing the count of elements in the `sceneObjects` array.
- `sceneObjects` is an array of XrSceneObjectMSFT.

The runtime **must** only set XrSceneObjectMSFT::`objectType` to any of the following XrSceneObjectTypeMSFT values:

- `XR_SCENE_OBJECT_TYPE_UNCATEGORIZED_MSFT`
- `XR_SCENE_OBJECT_TYPE_BACKGROUND_MSFT`
- `XR_SCENE_OBJECT_TYPE_WALL_MSFT`
- `XR_SCENE_OBJECT_TYPE_FLOOR_MSFT`
- `XR_SCENE_OBJECT_TYPE_CEILING_MSFT`
- `XR_SCENE_OBJECT_TYPE_PLATFORM_MSFT`
- `XR_SCENE_OBJECT_TYPE_INFERRED_MSFT`

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneObjectsMSFT
- type **must** be XR_TYPE_SCENE_OBJECTS_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- If sceneObjectCount is not 0, sceneObjects **must** be a pointer to an array of sceneObjectCount XrSceneObjectMSFT structures

The XrSceneObjectMSFT structure represents the state of a scene object.

It is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneObjectMSFT {
    XrSceneObjectTypeMSFT    objectType;
} XrSceneObjectMSFT;
```

Member Descriptions

- objectType is the type of the object specified by XrSceneObjectTypeMSFT.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneObjectMSFT
- objectType **must** be a valid XrSceneObjectTypeMSFT value

The XrSceneObjectTypeMSFT enumeration identifies the different types of scene objects.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrSceneObjectTypeMSFT {
    XR_SCENE_OBJECT_TYPE_UNCATEGORIZED_MSFT = -1,
    XR_SCENE_OBJECT_TYPE_BACKGROUND_MSFT = 1,
    XR_SCENE_OBJECT_TYPE_WALL_MSFT = 2,
    XR_SCENE_OBJECT_TYPE_FLOOR_MSFT = 3,
    XR_SCENE_OBJECT_TYPE_CEILING_MSFT = 4,
    XR_SCENE_OBJECT_TYPE_PLATFORM_MSFT = 5,
    XR_SCENE_OBJECT_TYPE_INFERRED_MSFT = 6,
    XR_SCENE_OBJECT_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSceneObjectTypeMSFT;
```

Enumerant Descriptions

- XR_SCENE_OBJECT_TYPE_UNCATEGORIZED_MSFT. This scene object has yet to be classified and assigned a type. This should not be confused with background, as this object could be anything; the system has just not come up with a strong enough classification for it yet.
- XR_SCENE_OBJECT_TYPE_BACKGROUND_MSFT. The scene object is known to be not one of the other recognized types of scene object. This class should not be confused with uncategorized where background is known not to be wall/floor/ceiling etc. while uncategorized is not yet categorized.
- XR_SCENE_OBJECT_TYPE_WALL_MSFT. A physical wall. Walls are assumed to be immovable environmental structures.
- XR_SCENE_OBJECT_TYPE_FLOOR_MSFT. Floors are any surfaces on which one can walk. Note: stairs are not floors. Also note, that floors assume any walkable surface and therefore there is no explicit assumption of a singular floor. Multi-level structures, ramps, etc. should all classify as floor.
- XR_SCENE_OBJECT_TYPE_CEILING_MSFT. The upper surface of a room.
- XR_SCENE_OBJECT_TYPE_PLATFORM_MSFT. A large flat surface on which you could place holograms. These tend to represent tables, countertops, and other large horizontal surfaces.
- XR_SCENE_OBJECT_TYPE_INFERRED_MSFT. An imaginary object that was added to the scene in order to make the scene watertight and avoid gaps.

Get scene planes

The runtime **must** fill out the XrScenePlanesMSFT structure when included in the XrSceneComponentsMSFT::`next` chain. The XrSceneComponentsGetInfoMSFT::componentType **must** be XR_SCENE_COMPONENT_TYPE_PLANE_MSFT when XrScenePlanesMSFT is included in the next chain. If it is not, the XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT error **must** be returned.

The XrScenePlanesMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrScenePlanesMSFT {
    XrStructureType      type;
    void*                next;
    uint32_t             scenePlaneCount;
    XrScenePlaneMSFT*    scenePlanes;
} XrScenePlanesMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `scenePlaneCount` is a `uint32_t` describing the count of elements in the XrScenePlaneMSFT array.
- `scenePlanes` is an array of XrScenePlaneMSFT.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrScenePlanesMSFT
- `type` **must** be `XR_TYPE_SCENE_PLANES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `scenePlaneCount` is not `0`, `scenePlanes` **must** be a pointer to an array of `scenePlaneCount` XrScenePlaneMSFT structures

The XrScenePlaneMSFT structure represents the state of a scene plane.

It is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrScenePlaneMSFT {
    XrScenePlaneAlignmentTypeMSFT    alignment;
    XrExtent2Df                      size;
    uint64_t                         meshBufferId;
    XrBool32                         supportsIndicesUint16;
} XrScenePlaneMSFT;
```

Member Descriptions

- `alignment` is the alignment type of the plane specified by XrScenePlaneAlignmentTypeMSFT.
- `size` is the 2D size of the plane's extent, where XrExtent2Df::`width` is the width of the plane along the X axis, and XrExtent2Df::`height` is the height of the plane along the Y axis.
- `meshBufferId` is the `uint64_t` identifier that specifies the scene mesh buffer of this plane's triangle mesh. If `meshBufferId` is zero then this plane does not have a mesh. The triangles in a planar mesh are coplanar.
- `supportsIndicesUint16` is `XR_TRUE` if the mesh supports reading 16-bit unsigned indices.

The `size` of a plane refers to the plane's size in the x-y plane of the plane's coordinate system. A plane with a position of {0,0,0}, rotation of {0,0,0,1} (no rotation), and an extent of {1,1} refers to a 1 meter x 1 meter plane centered at {0,0,0} with its front face normal vector pointing towards the +Z direction in the plane component's space. For planes with an alignment of `XR_SCENE_PLANE_ALIGNMENT_TYPE_VERTICAL_MSFT`, the +Y direction **must** point up away from the direction of gravity.

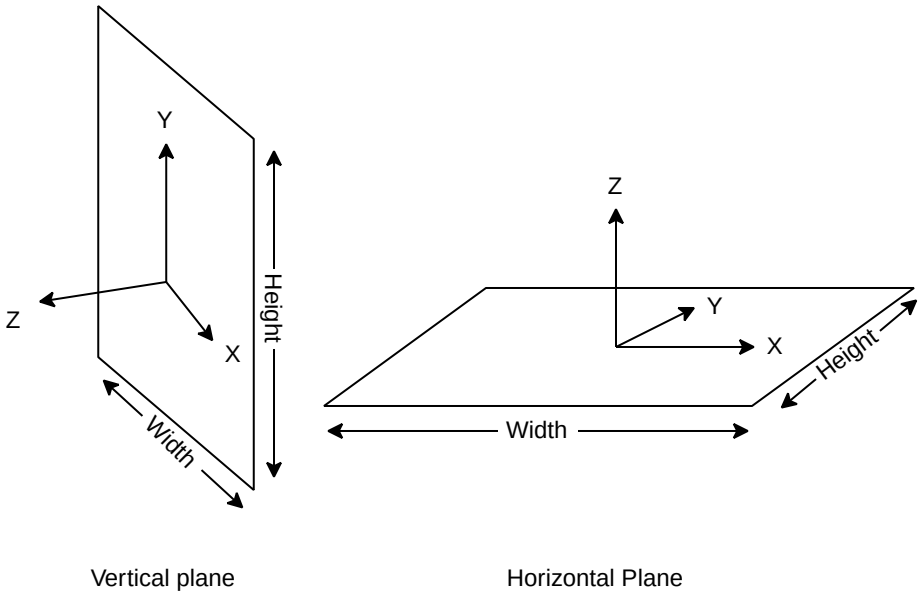

Figure 43. Scene Understanding Plane Coordinate System

Note

OpenXR uses an X-Y plane with +Z as the plane normal but other APIs may use an X-Z plane with +Y as the plane normal. The X-Y plane can be converted to an X-Z plane by rotating -π/2 radians around the +X axis.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrScenePlaneMSFT
- `alignment` **must** be a valid XrScenePlaneAlignmentTypeMSFT value

XrScenePlaneAlignmentTypeMSFT identifies the different plane alignment types.

```
// Provided by XR_MSFT_scene_understanding
typedef enum XrScenePlaneAlignmentTypeMSFT {
    XR_SCENE_PLANE_ALIGNMENT_TYPE_NON_ORTHOGONAL_MSFT = 0,
    XR_SCENE_PLANE_ALIGNMENT_TYPE_HORIZONTAL_MSFT = 1,
    XR_SCENE_PLANE_ALIGNMENT_TYPE_VERTICAL_MSFT = 2,
    XR_SCENE_PLANE_ALIGNMENT_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrScenePlaneAlignmentTypeMSFT;
```

Enumerant Descriptions

- XR_SCENE_PLANE_ALIGNMENT_TYPE_NON_ORTHOGONAL_MSFT means the plane's normal is not orthogonal or parallel to the gravity direction.
- XR_SCENE_PLANE_ALIGNMENT_TYPE_HORIZONTAL_MSFT means the plane's normal is roughly parallel to the gravity direction.
- XR_SCENE_PLANE_ALIGNMENT_TYPE_VERTICAL_MSFT means the plane's normal is roughly orthogonal to the gravity direction.

Get scene mesh

The runtime **must** fill out the XrSceneMeshesMSFT structure when included in the XrSceneComponentsMSFT::`next` chain. The XrSceneComponentsGetInfoMSFT::componentType **must** be XR_SCENE_COMPONENT_TYPE_VISUAL_MESH_MSFT or XR_SCENE_COMPONENT_TYPE_COLLIDER_MESH_MSFT when XrSceneMeshesMSFT is included in the next chain. If it is not, the XR_ERROR_SCENE_COMPONENT_TYPE_MISMATCH_MSFT error **must** be returned.

The XrSceneMeshesMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshesMSFT {
    XrStructureType     type;
    void*               next;
    uint32_t            sceneMeshCount;
    XrSceneMeshMSFT*    sceneMeshes;
} XrSceneMeshesMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `sceneMeshCount` is a `uint32_t` describing the count of elements in the `sceneMeshes` array.
- `sceneMeshes` is an array of XrSceneMeshMSFT.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneMeshesMSFT
- `type` **must** be `XR_TYPE_SCENE_MESHES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `sceneMeshCount` is not `0`, `sceneMeshes` **must** be a pointer to an array of `sceneMeshCount` XrSceneMeshMSFT structures

The XrSceneMeshMSFT structure represents the state of a scene component's mesh.

It is defined as:

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshMSFT {
    uint64_t    meshBufferId;
    XrBool32    supportsIndicesUint16;
} XrSceneMeshMSFT;
```

Member Descriptions

- `meshBufferId` is the `uint64_t` identifier that specifies the scene mesh buffer. If `meshBufferId` is zero then this scene component does not have mesh data of corresponding XrSceneComponentTypeMSFT in xrGetSceneComponentsMSFT::`getInfo`.
- `supportsIndicesUint16` is `XR_TRUE` if the mesh supports reading 16-bit unsigned indices.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneMeshMSFT

Read scene mesh buffer

The xrGetSceneMeshBuffersMSFT function retrieves the scene mesh vertex buffer and index buffer for the given scene mesh buffer identifier.

Note

Applications may use the scene mesh buffer identifier as a key to cache the vertices and indices of a mesh for reuse within an XrSceneMSFT or across multiple XrSceneMSFT for the same XrSession.

Applications can avoid unnecessarily calling xrGetSceneMeshBuffersMSFT for a scene component if XrSceneComponentMSFT::`updateTime` is equal to the XrSceneComponentMSFT::`updateTime` value in the previous XrSceneMSFT. A scene component is uniquely identified by XrUuidMSFT.

This function follows the two-call idiom for filling multiple buffers in a struct.

The xrGetSceneMeshBuffersMSFT function is defined as:

```
// Provided by XR_MSFT_scene_understanding
XrResult xrGetSceneMeshBuffersMSFT(
    XrSceneMSFT                                 scene,
    const XrSceneMeshBuffersGetInfoMSFT*        getInfo,
    XrSceneMeshBuffersMSFT*                     buffers);
```

Parameter Descriptions

- `scene` is an XrSceneMSFT previously created by xrCreateSceneMSFT.
- `getInfo` is a pointer to an XrSceneMeshBuffersGetInfoMSFT structure.
- `buffers` is a pointer to an XrSceneMeshBuffersMSFT structure for reading a scene mesh buffer.

Applications **can** request the vertex buffer of the mesh by including XrSceneMeshVertexBufferMSFT in the XrSceneMeshBuffersMSFT::`next` chain. Runtimes **must** support requesting a 32-bit index buffer and **may** support requesting a 16-bit index buffer. Applications **can** request a 32-bit index buffer by including XrSceneMeshIndicesUint32MSFT in the XrSceneMeshBuffersMSFT::`next` chain. Applications **can** request a 16-bit index buffer by including XrSceneMeshIndicesUint16MSFT in the XrSceneMeshBuffersMSFT::`next` chain. If the runtime for the given scene mesh buffer does not support requesting a 16-bit index buffer then `XR_ERROR_VALIDATION_FAILURE` **must** be returned. The runtime **must** support reading a 16-bit index buffer for the given scene mesh buffer if XrScenePlaneMSFT:supportsIndicesUint16 or XrSceneMeshMSFT:supportsIndicesUint16 are `XR_TRUE` for the scene component that contained that scene mesh buffer identifier.

The runtime **must** return `XR_ERROR_SCENE_MESH_BUFFER_ID_INVALID_MSFT` if none of the scene components in the given XrSceneMSFT contain XrSceneMeshBuffersGetInfoMSFT::`meshBufferId`. The runtime **must** return `XR_ERROR_SCENE_MESH_BUFFER_ID_INVALID_MSFT` if XrSceneMeshBuffersGetInfoMSFT::`meshBufferId` is zero. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if both XrSceneMeshIndicesUint32MSFT and XrSceneMeshIndicesUint16MSFT are included in the XrSceneMeshBuffersMSFT::`next` chain. The runtime **must** return `XR_ERROR_VALIDATION_FAILURE` if the XrSceneMeshBuffersMSFT::`next` does not contain at least one of XrSceneMeshVertexBufferMSFT, XrSceneMeshIndicesUint32MSFT or XrSceneMeshIndicesUint16MSFT.

The runtime **must** return the same vertices and indices for a given scene mesh buffer identifier and XrSession. A runtime **may** return zero vertices and indices if the underlying mesh data is no longer available.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to calling xrGetSceneMeshBuffersMSFT
- `scene` **must** be a valid XrSceneMSFT handle
- `getInfo` **must** be a pointer to a valid XrSceneMeshBuffersGetInfoMSFT structure
- `buffers` **must** be a pointer to an XrSceneMeshBuffersMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SCENE_COMPONENT_ID_INVALID_MSFT
- XR_ERROR_SCENE_MESH_BUFFER_ID_INVALID_MSFT
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

XrSceneMeshBuffersGetInfoMSFT is an input structure for the xrGetSceneMeshBuffersMSFT function.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshBuffersGetInfoMSFT {
    XrStructureType    type;
    const void*        next;
    uint64_t           meshBufferId;
} XrSceneMeshBuffersGetInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- meshBufferId is the uint64_t identifier that specifies the scene mesh buffer to read.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneMeshBuffersGetInfoMSFT
- type **must** be XR_TYPE_SCENE_MESH_BUFFERS_GET_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain

XrSceneMeshBuffersMSFT is an input/output structure for reading scene mesh buffers.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshBuffersMSFT {
    XrStructureType    type;
    void*              next;
} XrSceneMeshBuffersMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding extension **must** be enabled prior to using XrSceneMeshBuffersMSFT
- type **must** be XR_TYPE_SCENE_MESH_BUFFERS_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain. See also: XrSceneMeshIndicesUint16MSFT, XrSceneMeshIndicesUint32MSFT, XrSceneMeshVertexBufferMSFT

XrSceneMeshVertexBufferMSFT is an input/output structure for reading scene mesh buffer vertices.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshVertexBufferMSFT {
    XrStructureType    type;
    void*              next;
    uint32_t           vertexCapacityInput;
    uint32_t           vertexCountOutput;
    XrVector3f*        vertices;
} XrSceneMeshVertexBufferMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `vertexCapacityInput` is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- `vertexCountOutput` is the count of vertices, or the required capacity in the case that `vertexCapacityInput` is insufficient.
- `vertices` is an array of XrVector3f filled in by the runtime returns the position of vertices in the mesh component's space.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `vertices` size.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneMeshVertexBufferMSFT
- `type` **must** be `XR_TYPE_SCENE_MESH_VERTEX_BUFFER_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `vertexCapacityInput` is not `0`, `vertices` **must** be a pointer to an array of `vertexCapacityInput` XrVector3f structures

XrSceneMeshIndicesUint32MSFT is an input/output structure for reading 32-bit indices from a scene mesh buffer.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshIndicesUint32MSFT {
    XrStructureType    type;
    void*              next;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    uint32_t*          indices;
} XrSceneMeshIndicesUint32MSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `indexCapacityInput` is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- `indexCountOutput` is the count of indices, or the required capacity in the case that `indexCapacityInput` is insufficient.
- `indices` is an array of triangle indices filled in by the runtime, specifying the indices of the scene mesh buffer in the vertices array. The triangle indices **must** be returned in counter-clockwise order and three indices denote one triangle.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `indices` size.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneMeshIndicesUint32MSFT
- `type` **must** be `XR_TYPE_SCENE_MESH_INDICES_UINT32_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `indexCapacityInput` is not `0`, `indices` **must** be a pointer to an array of `indexCapacityInput` `uint32_t` values

XrSceneMeshIndicesUint16MSFT is an input/output structure for reading 16-bit indices from a scene mesh buffer.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneMeshIndicesUint16MSFT {
    XrStructureType    type;
    void*              next;
    uint32_t           indexCapacityInput;
    uint32_t           indexCountOutput;
    uint16_t*          indices;
} XrSceneMeshIndicesUint16MSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `indexCapacityInput` is the capacity of the array, or 0 to indicate a request to retrieve the required capacity.
- `indexCountOutput` is a pointer to the count of indices, or a pointer to the required capacity in the case that `indexCapacityInput` is insufficient.
- `indices` is an array of triangle indices filled in by the runtime, specifying the indices of the scene mesh buffer in the vertices array. The triangle indices **must** be returned in counter-clockwise order and three indices denote one triangle.
- See the Buffer Size Parameters section for a detailed description of retrieving the required `indices` size.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneMeshIndicesUint16MSFT
- `type` **must** be `XR_TYPE_SCENE_MESH_INDICES_UINT16_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `indexCapacityInput` is not `0`, `indices` **must** be a pointer to an array of `indexCapacityInput` `uint16_t` values

Locate scene objects

The xrLocateSceneComponentsMSFT function locates an array of scene components to a base space at a given time.

```
// Provided by XR_MSFT_scene_understanding
XrResult xrLocateSceneComponentsMSFT(
    XrSceneMSFT                                 scene,
    const XrSceneComponentsLocateInfoMSFT*      locateInfo,
    XrSceneComponentLocationsMSFT*              locations);
```

Parameter Descriptions

- `scene` is a handle to an XrSceneMSFT.
- `locateInfo` is a pointer to XrSceneComponentsLocateInfoMSFT describing information to locate scene components.
- `locations` is a pointer to XrSceneComponentLocationsMSFT receiving the returned scene component locations.

The runtime **must** return `XR_ERROR_SIZE_INSUFFICIENT` if XrSceneComponentLocationsMSFT::`locationCount` is less than XrSceneComponentsLocateInfoMSFT::`componentIdCount`.

Note

Similar to xrLocateSpace, apps should call xrLocateSceneComponentsMSFT each frame because the location returned by xrLocateSceneComponentsMSFT in later frames may change over time as the target space or the scene components may refine their locations.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to calling xrLocateSceneComponentsMSFT
- `scene` **must** be a valid XrSceneMSFT handle
- `locateInfo` **must** be a pointer to a valid XrSceneComponentsLocateInfoMSFT structure
- `locations` **must** be a pointer to an XrSceneComponentLocationsMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrSceneComponentsLocateInfoMSFT structure describes the information to locate scene components.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentsLocateInfoMSFT {
    XrStructureType      type;
    const void*          next;
    XrSpace              baseSpace;
    XrTime               time;
    uint32_t             componentIdCount;
    const XrUuidMSFT*    componentIds;
} XrSceneComponentsLocateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `baseSpace` is an XrSpace within which the scene components will be located.
- `time` is an `XrTime` at which to locate the scene components.
- `componentIdCount` is a `uint32_t` describing the count of elements in the `componentIds` array.
- `componentIds` is an array of XrUuidMSFT identifiers for the scene components to location.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentsLocateInfoMSFT
- `type` **must** be `XR_TYPE_SCENE_COMPONENTS_LOCATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `baseSpace` **must** be a valid XrSpace handle
- If `componentIdCount` is not `0`, `componentIds` **must** be a pointer to an array of `componentIdCount` XrUuidMSFT structures

The XrSceneComponentLocationsMSFT structure returns scene component locations.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentLocationsMSFT {
    XrStructureType                 type;
    void*                           next;
    uint32_t                        locationCount;
    XrSceneComponentLocationMSFT*   locations;
} XrSceneComponentLocationsMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `locationCount` is a `uint32_t` describing the count of elements in the `locations` array.
- `locations` is an array of XrSceneComponentLocationMSFT scene component locations.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentLocationsMSFT
- `type` **must** be `XR_TYPE_SCENE_COMPONENT_LOCATIONS_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `locationCount` is not `0`, `locations` **must** be a pointer to an array of `locationCount` XrSceneComponentLocationMSFT structures

The XrSceneComponentLocationMSFT structure describes the position and orientation of a scene component to space XrSceneComponentsLocateInfoMSFT::`baseSpace` at time XrSceneComponentsLocateInfoMSFT::`time`. If the scene component identified by XrUuidMSFT is not found, `flags` should be empty.

```
// Provided by XR_MSFT_scene_understanding
typedef struct XrSceneComponentLocationMSFT {
    XrSpaceLocationFlags    flags;
    XrPosef                 pose;
} XrSceneComponentLocationMSFT;
```

Member Descriptions

- `flags` is a bitfield, with bit masks defined in XrSpaceLocationFlagBits, to indicate which members contain valid data.
- `pose` is an XrPosef defining the position and orientation of the scene component within the reference frame of the corresponding XrSceneComponentsLocateInfoMSFT::`baseSpace`.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding` extension **must** be enabled prior to using XrSceneComponentLocationMSFT
- `flags` **must** be `0` or a valid combination of XrSpaceLocationFlagBits values

New Object Types

- XrSceneObserverMSFT
- XrSceneMSFT

New Flag Types

New Enum Constants

XrObjectType enumeration is extended with:

- `XR_OBJECT_TYPE_SCENE_OBSERVER_MSFT`
- `XR_OBJECT_TYPE_SCENE_MSFT`

XrStructureType enumeration is extended with:

- `XR_TYPE_SCENE_OBSERVER_CREATE_INFO_MSFT`
- `XR_TYPE_SCENE_CREATE_INFO_MSFT`
- `XR_TYPE_NEW_SCENE_COMPUTE_INFO_MSFT`
- `XR_TYPE_VISUAL_MESH_COMPUTE_LOD_INFO_MSFT`
- `XR_TYPE_SCENE_COMPONENTS_MSFT`
- `XR_TYPE_SCENE_COMPONENTS_GET_INFO_MSFT`
- `XR_TYPE_SCENE_COMPONENT_LOCATIONS_MSFT`
- `XR_TYPE_SCENE_COMPONENTS_LOCATE_INFO_MSFT`
- `XR_TYPE_SCENE_OBJECTS_MSFT`

Overview

This extension extends the scene understanding extension and enables scenes to be serialized or deserialized. It enables computing a new scene into a serialized binary stream and it enables deserializing a binary stream into an XrSceneMSFT handle.

Serialize a scene

This extension adds XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT to XrSceneComputeFeatureMSFT, which **can** be passed to xrComputeNewSceneMSFT plus one or more of XR_SCENE_COMPUTE_FEATURE_PLANE_MSFT, XR_SCENE_COMPUTE_FEATURE_PLANE_MESH_MSFT, XR_SCENE_COMPUTE_FEATURE_VISUAL_MESH_MSFT or XR_SCENE_COMPUTE_FEATURE_COLLIDER_MESH_MSFT to inform the runtime that it **should** compute a serialized binary representation of the scene. If XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT is the only XrSceneComputeFeatureMSFT passed to xrComputeNewSceneMSFT then XR_ERROR_SCENE_COMPUTE_FEATURE_INCOMPATIBLE_MSFT **must** be returned.

If an XrSceneMSFT was created using XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT then XR_SCENE_COMPONENT_TYPE_SERIALIZED_SCENE_FRAGMENT_MSFT can be passed to the xrGetSceneComponentsMSFT function to read the list of serialized scene fragment XrUuidMSFT values from XrSceneComponentMSFT::id. The XrUuidMSFT of a scene fragment can be passed to xrGetSerializedSceneFragmentDataMSFT to read the binary data of the given scene fragment.

The application **can** call the xrGetSerializedSceneFragmentDataMSFT function to read the binary data of a serialized scene fragment from the XrSceneMSFT handle. This function follows the two-call idiom for filling the buffer.

The xrGetSerializedSceneFragmentDataMSFT function is defined as:

```
// Provided by XR_MSFT_scene_understanding_serialization
XrResult xrGetSerializedSceneFragmentDataMSFT(
    XrSceneMSFT                                 scene,
    const XrSerializedSceneFragmentDataGetInfoMSFT* getInfo,
    uint32_t                                    countInput,
    uint32_t*                                   readOutput,
    uint8_t*                                    buffer);
```

Parameter Descriptions

- scene is the XrSceneMSFT handle to read from.
- getInfo is a pointer to an XrSerializedSceneFragmentDataGetInfoMSFT structure.
- countInput is the number of bytes that should be read.
- readOutput is the number of bytes read.
- buffer is a pointer to the buffer where the data should be copied.

The runtime **must** return XR_ERROR_SCENE_COMPONENT_ID_INVALID_MSFT if the given scene fragment XrUuidMSFT was not found.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding_serialization extension **must** be enabled prior to calling xrGetSerializedSceneFragmentDataMSFT
- scene **must** be a valid XrSceneMSFT handle
- getInfo **must** be a pointer to a valid XrSerializedSceneFragmentDataGetInfoMSFT structure
- readOutput **must** be a pointer to a uint32_t value
- If countInput is not 0, buffer **must** be a pointer to an array of countInput uint8_t values

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SCENE_COMPONENT_ID_INVALID_MSFT
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The XrSerializedSceneFragmentDataGetInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_scene_understanding_serialization
typedef struct XrSerializedSceneFragmentDataGetInfoMSFT {
    XrStructureType    type;
    const void*        next;
    XrUuidMSFT         sceneFragmentId;
} XrSerializedSceneFragmentDataGetInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `sceneFragmentId` is the XrUuidMSFT of the serialized scene fragment that was previously read from xrGetSceneComponentsMSFT with `XR_SCENE_COMPONENT_TYPE_SERIALIZED_SCENE_FRAGMENT_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding_serialization` extension **must** be enabled prior to using XrSerializedSceneFragmentDataGetInfoMSFT
- `type` **must** be `XR_TYPE_SERIALIZED_SCENE_FRAGMENT_DATA_GET_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Deserialize a scene

This extension enables an application to deserialize the binary representation of a scene that was previously serialized.

For a given XrSceneObserverMSFT handle, instead of calling xrComputeNewSceneMSFT, which computes the scene from the system's sensors, the application **can** use xrDeserializeSceneMSFT to produce a scene from the given binary scene fragment data.

The xrDeserializeSceneMSFT function is defined as:

```
// Provided by XR_MSFT_scene_understanding_serialization
XrResult xrDeserializeSceneMSFT(
    XrSceneObserverMSFT                         sceneObserver,
    const XrSceneDeserializeInfoMSFT*           deserializeInfo);
```

Parameter Descriptions

- `sceneObserver` is a handle to an XrSceneObserverMSFT previously created with xrCreateSceneObserverMSFT.
- `deserializeInfo` is a pointer to an XrSceneDeserializeInfoMSFT structure.

The xrDeserializeSceneMSFT function begins deserializing a list of serialized scene fragments. The

runtime **must** return quickly without waiting for the deserialization to complete. The application **should** use xrGetSceneComputeStateMSFT to inspect the completeness of the deserialization.

The runtime **must** return XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT if xrDeserializeSceneMSFT is called while the scene computation is in progress.

The xrGetSceneComputeStateMSFT function **must** return XR_SCENE_COMPUTE_STATE_UPDATING_MSFT while the deserialization is in progress, and XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT when the deserialization has completed successfully. If the runtime fails to deserialize the binary stream, xrGetSceneComputeStateMSFT **must** return XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT to indicate that the deserialization has completed but an error occurred.

When xrGetSceneComputeStateMSFT returns XR_SCENE_COMPUTE_STATE_COMPLETED_MSFT, the application **may** call xrCreateSceneMSFT to create the XrSceneMSFT handle. If xrCreateSceneMSFT is called while xrGetSceneComputeStateMSFT returns XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT, a valid XrSceneMSFT handle **must** be returned, but that handle **must** contain zero scene components.

Valid Usage (Implicit)

- The XR_MSFT_scene_understanding_serialization extension **must** be enabled prior to calling xrDeserializeSceneMSFT
- sceneObserver **must** be a valid XrSceneObserverMSFT handle
- deserializeInfo **must** be a pointer to a valid XrSceneDeserializeInfoMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_COMPUTE_NEW_SCENE_NOT_COMPLETED_MSFT
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

XrSceneDeserializeInfoMSFT is an input structure that describes the array of serialized scene fragments that will be deserialized by the xrDeserializeSceneMSFT function.

```
// Provided by XR_MSFT_scene_understanding_serialization
typedef struct XrSceneDeserializeInfoMSFT {
    XrStructureType                           type;
    const void*                               next;
    uint32_t                                  fragmentCount;
    const XrDeserializeSceneFragmentMSFT*     fragments;
} XrSceneDeserializeInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `fragmentCount` is the count of XrDeserializeSceneFragmentMSFT structures in the `fragments` array.
- `fragments` is an array of XrDeserializeSceneFragmentMSFT.

If the scene fragments are not in the same order as returned by xrGetSceneComponentsMSFT or the runtime failed to deserialized the binary data then xrGetSceneComputeStateMSFT **must** return `XR_SCENE_COMPUTE_STATE_COMPLETED_WITH_ERROR_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding_serialization` extension **must** be enabled prior to using XrSceneDeserializeInfoMSFT
- `type` **must** be `XR_TYPE_SCENE_DESERIALIZE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- If `fragmentCount` is not `0`, `fragments` **must** be a pointer to an array of `fragmentCount` valid XrDeserializeSceneFragmentMSFT structures

The XrDeserializeSceneFragmentMSFT structure represents a single fragment of a binary stream to be deserialized. It is defined as:

```
// Provided by XR_MSFT_scene_understanding_serialization
typedef struct XrDeserializeSceneFragmentMSFT {
    uint32_t          bufferSize;
    const uint8_t*    buffer;
} XrDeserializeSceneFragmentMSFT;
```

Member Descriptions

- `bufferSize` is the size of the `buffer` array.
- `buffer` is an array of `uint_8` data for the scene fragment to be deserialized.

Valid Usage (Implicit)

- The `XR_MSFT_scene_understanding_serialization` extension **must** be enabled prior to using XrDeserializeSceneFragmentMSFT
- If `bufferSize` is not `0`, `buffer` **must** be a pointer to an array of `bufferSize` `uint8_t` values

New Object Types

New Flag Types

New Enum Constants

XrSceneComponentTypeMSFT enumeration is extended with:

- `XR_SCENE_COMPONENT_TYPE_SERIALIZED_SCENE_FRAGMENT_MSFT`

XrSceneComputeFeatureMSFT enumeration is extended with:

- `XR_SCENE_COMPUTE_FEATURE_SERIALIZE_SCENE_MSFT`

XrStructureType enumeration is extended with:

- `XR_TYPE_SERIALIZED_SCENE_FRAGMENT_DATA_GET_INFO_MSFT`
- `XR_TYPE_SCENE_DESERIALIZE_INFO_MSFT`

14.34.1. Overview

This extension allows an application to enable support for one or more **secondary view configurations**. A secondary view configuration is a well-known set of views that the runtime can make active while a session is running. In a frame where a secondary view configuration is active, the application's single frame loop should additionally render into those active secondary views, sharing the frame waiting logic and update loop with the primary view configuration for that running session.

A proper secondary view configuration support includes following steps:

1. When calling xrCreateInstance, enable the `XR_MSFT_secondary_view_configuration` extension and the extension defines a concrete secondary view configuration type, for example, `XR_MSFT_first_person_observer`.
2. Inspect supported secondary view configurations using the xrEnumerateViewConfigurations function.
3. Enable supported secondary view configurations using the xrBeginSession function with an XrSecondaryViewConfigurationSessionBeginInfoMSFT chained extension structure.
4. Inspect if an enabled secondary view configuration is activated by the system or the user using the xrWaitFrame function with an XrSecondaryViewConfigurationFrameStateMSFT chained extension structure.
5. When a secondary view configuration is changed to active, get the latest view configuration properties using the xrGetViewConfigurationProperties and xrEnumerateViewConfigurationViews functions.
6. Create the swapchain images for the active secondary view configuration using the xrCreateSwapchain function with an XrSecondaryViewConfigurationSwapchainCreateInfoMSFT chained extension structure using `recommendedImageRectWidth` and `recommendedImageRectHeight` in the corresponding XrViewConfigurationView structure returned from xrEnumerateViewConfigurationViews.
7. Locate the secondary view configuration views using the xrLocateViews function with the active secondary view configuration type.
8. Submit the composition layers using the swapchain images for an active secondary view configuration using the xrEndFrame function with the XrSecondaryViewConfigurationFrameEndInfoMSFT chained extension structure.

14.34.2. Enumerate supported secondary view configurations

The first step is for the application to inspect if a runtime supports certain secondary view

configurations. The app uses the existing API xrEnumerateViewConfigurations for this.

For example, when the XR_MSFT_first_person_observer extension is enabled, the application will enumerate a view configuration of type XR_VIEW_CONFIGURATION_TYPE_SECONDARY_MONO_FIRST_PERSON_OBSERVER_MSFT, and can use this secondary view configuration type in later functions.

14.34.3. Secondary view configuration properties

The application can inspect the properties of a secondary view configuration through the existing xrGetViewConfigurationProperties, xrEnumerateViewConfigurationViews and xrEnumerateEnvironmentBlendModes functions using a supported secondary view configuration type.

The runtime **may** change the recommended properties, such as recommended image width or height, when the secondary view configuration becomes active. The application **should** use the latest recommended width and height when creating swapchain images and related resources for the active secondary view configuration.

When an application creates swapchain images for a secondary view configuration, it **can** chain a XrSecondaryViewConfigurationSwapchainCreateInfoMSFT structure to XrSwapchainCreateInfo when calling xrCreateSwapchain. This hints to the runtime that the created swapchain image will be submitted to the given secondary view configuration, allowing the runtime to make optimizations for such usage when there is opportunity.

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationSwapchainCreateInfoMSFT {
    XrStructureType           type;
    const void*               next;
    XrViewConfigurationType   viewConfigurationType;
} XrSecondaryViewConfigurationSwapchainCreateInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- viewConfigurationType is the secondary view configuration type the application is intending to use this swapchain for.

If this structure is not present in the XrSwapchainCreateInfo next chain when calling xrCreateSwapchain, the runtime **should** optimize the created swapchain for the primary view configuration of the session.

If the application submits a swapchain image created with one view configuration type to a composition layer for another view configuration, the runtime **may** need to copy the resource across view configurations. However, the runtime **must** correctly compose the image regardless which view configuration type was hinted when swapchain image was created.

Valid Usage (Implicit)

- The `XR_MSFT_secondary_view_configuration` extension **must** be enabled prior to using XrSecondaryViewConfigurationSwapchainCreateInfoMSFT
- `type` **must** be `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_SWAPCHAIN_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `viewConfigurationType` **must** be a valid XrViewConfigurationType value

14.34.4. Enable secondary view configuration

The application indicates to the runtime which secondary view configurations it can support by chaining an XrSecondaryViewConfigurationSessionBeginInfoMSFT structure to the XrSessionBeginInfo::`next` pointer when calling xrBeginSession.

The XrSecondaryViewConfigurationSessionBeginInfoMSFT structure is used by the application to indicate the list of secondary XrViewConfigurationType to enable for this session.

It is defined as:

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationSessionBeginInfoMSFT {
    XrStructureType                     type;
    const void*                         next;
    uint32_t                            viewConfigurationCount;
    const XrViewConfigurationType*      enabledViewConfigurationTypes;
} XrSecondaryViewConfigurationSessionBeginInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `viewConfigurationCount` is the number of elements in `enabledViewConfigurationTypes`
- `enabledViewConfigurationTypes` is an array of enabled secondary view configuration types that application supports.

If there are any duplicated view configuration types in the array of `enabledViewConfigurationTypes`, the runtime **must** return error `XR_ERROR_VALIDATION_FAILURE`.

If there are any primary view configuration types in the array of `enabledViewConfigurationTypes`, the runtime **must** return error `XR_ERROR_VALIDATION_FAILURE`.

If there are any secondary view configuration types not returned by xrEnumerateViewConfigurations in the array of `enabledViewConfigurationTypes`, the runtime **must** return error `XR_ERROR_VIEW_CONFIGURATION_TYPE_UNSUPPORTED`.

Valid Usage (Implicit)

- The `XR_MSFT_secondary_view_configuration` extension **must** be enabled prior to using XrSecondaryViewConfigurationSessionBeginInfoMSFT
- `type` **must** be `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_SESSION_BEGIN_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `enabledViewConfigurationTypes` **must** be a pointer to an array of `viewConfigurationCount` valid XrViewConfigurationType values
- The `viewConfigurationCount` parameter **must** be greater than `0`

14.34.5. Per-frame active view configurations

The runtime then tells the application at each xrWaitFrame function call which of the enabled secondary view configurations are active for that frame. When extension structure XrSecondaryViewConfigurationFrameStateMSFT is chained to the XrFrameState::next pointer, the runtime writes into this structure the state of each enabled secondary view configuration.

The XrSecondaryViewConfigurationFrameStateMSFT structure returns whether the enabled view configurations are active or inactive.

It is defined as as:

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationFrameStateMSFT {
    XrStructureType                           type;
    void*                                     next;
    uint32_t                                  viewConfigurationCount;
    XrSecondaryViewConfigurationStateMSFT*    viewConfigurationStates;
} XrSecondaryViewConfigurationFrameStateMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `viewConfigurationCount` is the number of elements in `viewConfigurationStates`.
- `viewConfigurationStates` is an array of XrSecondaryViewConfigurationStateMSFT structures.

The array size `viewConfigurationCount` in the XrSecondaryViewConfigurationFrameStateMSFT structure **must** be the same as the array size enabled through XrSecondaryViewConfigurationSessionBeginInfoMSFT when calling xrBeginSession earlier, otherwise the runtime **must** return error `XR_ERROR_VALIDATION_FAILURE`.

Valid Usage (Implicit)

- The `XR_MSFT_secondary_view_configuration` extension **must** be enabled prior to using XrSecondaryViewConfigurationFrameStateMSFT
- `type` **must** be `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_FRAME_STATE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `viewConfigurationStates` **must** be a pointer to an array of `viewConfigurationCount` XrSecondaryViewConfigurationStateMSFT structures
- The `viewConfigurationCount` parameter **must** be greater than `0`

The XrSecondaryViewConfigurationStateMSFT structure returns the state of an enabled secondary view configurations.

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationStateMSFT {
    XrStructureType           type;
    void*                     next;
    XrViewConfigurationType   viewConfigurationType;
    XrBool32                  active;
} XrSecondaryViewConfigurationStateMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `viewConfigurationType` is an XrViewConfigurationType that represents the returned state.
- `active` is an `XrBool32` returns whether the secondary view configuration is active and displaying frames to users.

When a secondary view configuration becomes active, the application **should** render its secondary views as soon as possible, by getting their view transforms and FOV using xrLocateViews and then submitting composition layers to xrEndFrame through the XrSecondaryViewConfigurationFrameEndInfoMSFT extension structure. When a secondary view configuration changes from inactive to active, the runtime **may** change XrViewConfigurationView of the given view configuration such as the recommended image width or height. An application **should** query for latest XrViewConfigurationView through xrEnumerateViewConfigurationViews function for the secondary view configuration and consider recreating swapchain images if necessary. The runtime **must** not change the XrViewConfigurationView, including recommended image width and height of a secondary view configuration when `active` remains true until the secondary view configuration deactivated or the session has ended.

If necessary, the application **can** take longer than a frame duration to prepare by calling xrEndFrame without submitting layers for that secondary view configuration until ready. The runtime **should** delay the underlying scenario managed by the secondary view configuration until the application begins submitting frames with layers for that configuration. The active secondary view configuration composed output is undefined if the application stops submitting frames with layers for a secondary view configuration while `active` remains true.

When the runtime intends to conclude a secondary view configuration, for example when user stops video capture, the runtime makes the view configuration inactive by setting the corresponding `active` in the XrSecondaryViewConfigurationStateMSFT structure to false.

Valid Usage (Implicit)

- The `XR_MSFT_secondary_view_configuration` extension **must** be enabled prior to using XrSecondaryViewConfigurationStateMSFT
- `type` **must** be `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_STATE_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `viewConfigurationType` **must** be a valid XrViewConfigurationType value

14.34.6. Locate and inspect view states of secondary view configurations

When the application calls xrLocateViews, it **can** use XrViewLocateInfo::viewConfigurationType field to query the view locations and projections for any enabled XrViewConfigurationType for the running session.

The runtime **must** return XR_ERROR_VIEW_CONFIGURATION_TYPE_UNSUPPORTED from xrLocateViews if the specified XrViewConfigurationType is not enabled for the running session using XrSecondaryViewConfigurationSessionBeginInfoMSFT when calling xrBeginSession.

If the view configuration is supported but not active, as indicated in XrSecondaryViewConfigurationFrameStateMSFT, xrLocateViews will successfully return, but the resulting XrViewState **may** have XR_VIEW_STATE_ORIENTATION_TRACKED_BIT and XR_VIEW_STATE_ORIENTATION_TRACKED_BIT unset.

14.34.7. Submit composition layers to secondary view configurations

The application **should** submit layers each frame for all active secondary view configurations using the xrEndFrame function, by chaining the XrSecondaryViewConfigurationFrameEndInfoMSFT structure to the next pointer of XrFrameEndInfo structure.

The XrSecondaryViewConfigurationFrameEndInfoMSFT structure is defined as as:

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationFrameEndInfoMSFT {
    XrStructureType                                 type;
    const void*                                     next;
    uint32_t                                        viewConfigurationCount;
    const XrSecondaryViewConfigurationLayerInfoMSFT*    viewConfigurationLayersInfo;
} XrSecondaryViewConfigurationFrameEndInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- viewConfigurationCount is the number of elements in viewConfigurationLayersInfo.
- viewConfigurationLayersInfo is an array of XrSecondaryViewConfigurationLayerInfoMSFT, containing composition layers to be submitted for the specified active view configuration.

The view configuration type in each XrSecondaryViewConfigurationLayerInfoMSFT must be one of the view configurations enabled when calling xrBeginSession in XrSecondaryViewConfigurationSessionBeginInfoMSFT, or else the runtime **must** return error

XR_ERROR_SECONDARY_VIEW_CONFIGURATION_TYPE_NOT_ENABLED_MSFT.

The view configuration type in each XrSecondaryViewConfigurationLayerInfoMSFT must not be the primary view configuration in this session, or else the runtime **must** return error XR_ERROR_LAYER_INVALID. The primary view configuration layers continue to be submitted through XrFrameEndInfo directly.

If the view configuration is not active, as indicated in XrSecondaryViewConfigurationFrameStateMSFT, the composition layers submitted to this view configuration **may** be ignored by the runtime. Applications **should** avoid rendering into secondary views when the view configuration is inactive.

Valid Usage (Implicit)

- The XR_MSFT_secondary_view_configuration extension **must** be enabled prior to using XrSecondaryViewConfigurationFrameEndInfoMSFT
- type **must** be XR_TYPE_SECONDARY_VIEW_CONFIGURATION_FRAME_END_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- viewConfigurationLayersInfo **must** be a pointer to an array of viewConfigurationCount valid XrSecondaryViewConfigurationLayerInfoMSFT structures
- The viewConfigurationCount parameter **must** be greater than 0

The application should submit an XrSecondaryViewConfigurationLayerInfoMSFT in XrSecondaryViewConfigurationFrameEndInfoMSFT for each active secondary view configuration type when calling xrEndFrame.

The XrSecondaryViewConfigurationLayerInfoMSFT structure is defined as as:

```
// Provided by XR_MSFT_secondary_view_configuration
typedef struct XrSecondaryViewConfigurationLayerInfoMSFT {
    XrStructureType                                 type;
    const void*                                     next;
    XrViewConfigurationType                         viewConfigurationType;
    XrEnvironmentBlendMode                          environmentBlendMode;
    uint32_t                                        layerCount;
    const XrCompositionLayerBaseHeader* const*      layers;
} XrSecondaryViewConfigurationLayerInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `viewConfigurationType` is XrViewConfigurationType to which the composition layers will be displayed.
- `environmentBlendMode` is the XrEnvironmentBlendMode value representing the desired environment blend mode for this view configuration.
- `layerCount` is the number of composition layers in this frame for the secondary view configuration type. The maximum supported layer count is identified by XrSystemGraphicsProperties::maxLayerCount. If layerCount is greater than the maximum supported layer count then `XR_ERROR_LAYER_LIMIT_EXCEEDED` is returned.
- `layers` is a pointer to an array of XrCompositionLayerBaseHeader pointers.

This structure is similar to the XrFrameEndInfo structure, with an extra XrViewConfigurationType field to specify the view configuration for which the submitted layers will be rendered.

The application **should** render its content for both the primary and secondary view configurations using the same XrFrameState::`predictedDisplayTime` reported by xrWaitFrame. The runtime **must** treat both the primary views and secondary views as being submitted for the same XrViewLocateInfo ::`displayTime` specified in the call to xrEndFrame.

For layers such as quad layers whose content is identical across view configurations, the application **can** submit the same XrCompositionLayerBaseHeader structures to multiple view configurations in the same xrEndFrame function call.

For each frame, the application **should** only render and submit layers for the secondary view configurations that were active that frame, as indicated in the XrSecondaryViewConfigurationFrameStateMSFT filled in for that frame's xrWaitFrame call. The runtime **must** ignore composition layers submitted for an inactive view configuration.

Valid Usage (Implicit)

- The `XR_MSFT_secondary_view_configuration` extension **must** be enabled prior to using XrSecondaryViewConfigurationLayerInfoMSFT
- `type` **must** be `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_LAYER_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `viewConfigurationType` **must** be a valid XrViewConfigurationType value
- `environmentBlendMode` **must** be a valid XrEnvironmentBlendMode value
- `layers` **must** be a pointer to an array of `layerCount` valid XrCompositionLayerBaseHeader -based structures. See also: XrCompositionLayerCubeKHR, XrCompositionLayerCylinderKHR, XrCompositionLayerEquirect2KHR, XrCompositionLayerEquirectKHR, XrCompositionLayerPassthroughANDROID, XrCompositionLayerPassthroughFB, XrCompositionLayerPassthroughHTC, XrCompositionLayerProjection, XrCompositionLayerQuad
- The `layerCount` parameter **must** be greater than `0`

New Object Types

New Flag Types

New Enum Constants

XrStructureType enumeration is extended with:

- `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_SESSION_BEGIN_INFO_MSFT`
- `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_STATE_MSFT`
- `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_FRAME_STATE_MSFT`
- `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_FRAME_END_INFO_MSFT`
- `XR_TYPE_SECONDARY_VIEW_CONFIGURATION_LAYER_INFO_MSFT`

OpenXR 1.0

Deprecation State

- *Obsoleted* by `XR_EXT_spatial_anchor` extension

Overview

This extension allows an application to create a **spatial anchor**, an arbitrary freespace point in the user's physical environment that will then be tracked by the runtime. The runtime **should** then adjust the position and orientation of that anchor's origin over time as needed, independently of all other spaces and anchors, to ensure that it maintains its original mapping to the real world.

```
// Provided by XR_MSFT_spatial_anchor
XR_DEFINE_HANDLE(XrSpatialAnchorMSFT)
```

Spatial anchors are often used in combination with an UNBOUNDED_MSFT reference space. UNBOUNDED_MSFT reference spaces adjust their origin as necessary to keep the viewer's coordinates relative to the space's origin stable. Such adjustments maintain the visual stability of content currently near the viewer, but may cause content placed far from the viewer to drift in its alignment to the real world by the time the user moves close again. By creating an XrSpatialAnchorMSFT where a piece of content is placed and then always rendering that content relative to its anchor's space, an application can ensure that each piece of content stays at a fixed location in the environment.

The xrCreateSpatialAnchorMSFT function is defined as:

```
// Provided by XR_MSFT_spatial_anchor
XrResult xrCreateSpatialAnchorMSFT(
    XrSession                                   session,
    const XrSpatialAnchorCreateInfoMSFT*        createInfo,
    XrSpatialAnchorMSFT*                        anchor);
```

Parameter Descriptions

- session is a handle to an XrSession.
- createInfo is a pointer to an XrSpatialAnchorCreateInfoMSFT structure containing information about how to create the anchor.
- anchor is a pointer to a handle in which the created XrSpatialAnchorMSFT is returned.

Creates an XrSpatialAnchorMSFT handle representing a spatial anchor that will track a fixed location in the physical world over time. That real-world location is specified by the position and orientation of the specified XrSpatialAnchorCreateInfoMSFT::pose within XrSpatialAnchorCreateInfoMSFT::space at XrSpatialAnchorCreateInfoMSFT::time.

The runtime **must** avoid long blocking operations such as networking or disk operations for xrCreateSpatialAnchorMSFT function. The application **may** safely use this function in UI thread. Though, the created anchor handle **may** not be ready immediately for certain operations yet. For example, the corresponding anchor space **may** not return valid location, or its location **may** not be successfully saved in anchor store.

If XrSpatialAnchorCreateInfoMSFT::space cannot be located relative to the environment at the moment of the call to xrCreateSpatialAnchorMSFT, the runtime **must** return XR_ERROR_CREATE_SPATIAL_ANCHOR_FAILED_MSFT.

After the anchor is created, the runtime **should** then adjust its position and orientation over time relative to other spaces so as to maintain maximum alignment to its original real-world location, even if that changes the anchor's relationship to the original XrSpatialAnchorCreateInfoMSFT::space used to initialize it.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor extension **must** be enabled prior to calling xrCreateSpatialAnchorMSFT
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialAnchorCreateInfoMSFT structure
- `anchor` **must** be a pointer to an XrSpatialAnchorMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_CREATE_SPATIAL_ANCHOR_FAILED_MSFT
- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorCreateInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_spatial_anchor
typedef struct XrSpatialAnchorCreateInfoMSFT {
    XrStructureType    type;
    const void*        next;
    XrSpace            space;
    XrPosef            pose;
    XrTime             time;
} XrSpatialAnchorCreateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `space` is a handle to the XrSpace in which `pose` is specified.
- `pose` is the XrPosef within `space` at `time` that specifies the point in the real world used to initialize the new anchor.
- `time` is the `XrTime` at which `pose` will be evaluated within `space`.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor` extension **must** be enabled prior to using XrSpatialAnchorCreateInfoMSFT
- `type` **must** be `XR_TYPE_SPATIAL_ANCHOR_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle

The xrCreateSpatialAnchorSpaceMSFT function is defined as:

```
// Provided by XR_MSFT_spatial_anchor
XrResult xrCreateSpatialAnchorSpaceMSFT(
    XrSession                                   session,
    const XrSpatialAnchorSpaceCreateInfoMSFT*   createInfo,
    XrSpace*                                    space);
```

Parameter Descriptions

- `session` is a handle to an XrSession.
- `createInfo` is a pointer to an XrSpatialAnchorSpaceCreateInfoMSFT structure containing information about how to create the anchor.
- `space` is a pointer to a handle in which the created XrSpace is returned.

Creates an XrSpace handle based on a spatial anchor. Application **can** provide an XrPosef to define the position and orientation of the new space's origin relative to the anchor's natural origin.

Multiple XrSpace handles may exist for a given XrSpatialAnchorMSFT simultaneously, up to some limit imposed by the runtime. The XrSpace handle must be eventually freed via the xrDestroySpace function or by destroying the parent XrSpatialAnchorMSFT handle.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor` extension **must** be enabled prior to calling xrCreateSpatialAnchorSpaceMSFT
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialAnchorSpaceCreateInfoMSFT structure
- `space` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialAnchorSpaceCreateInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_spatial_anchor
typedef struct XrSpatialAnchorSpaceCreateInfoMSFT {
    XrStructureType        type;
    const void*            next;
    XrSpatialAnchorMSFT    anchor;
    XrPosef                poseInAnchorSpace;
} XrSpatialAnchorSpaceCreateInfoMSFT;
```

Member Descriptions

- type is the XrStructureType of this structure.
- next is NULL or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- anchor is a handle to an XrSpatialAnchorMSFT previously created with xrCreateSpatialAnchorMSFT.
- poseInAnchorSpace is an XrPosef defining the position and orientation of the new space's origin relative to the anchor's natural origin.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor extension **must** be enabled prior to using XrSpatialAnchorSpaceCreateInfoMSFT
- type **must** be XR_TYPE_SPATIAL_ANCHOR_SPACE_CREATE_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- anchor **must** be a valid XrSpatialAnchorMSFT handle

The xrDestroySpatialAnchorMSFT function is defined as:

```
// Provided by XR_MSFT_spatial_anchor
XrResult xrDestroySpatialAnchorMSFT(
    XrSpatialAnchorMSFT                         anchor);
```

Parameter Descriptions

- anchor is a handle to an XrSpatialAnchorMSFT previously created by xrCreateSpatialAnchorMSFT.

XrSpatialAnchorMSFT handles are destroyed using xrDestroySpatialAnchorMSFT. By destroying an anchor, the runtime **can** stop spending resources used to maintain tracking for that anchor's origin.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor extension **must** be enabled prior to calling xrDestroySpatialAnchorMSFT
- anchor **must** be a valid XrSpatialAnchorMSFT handle

Thread Safety

- Access to anchor, and any child handles, **must** be externally synchronized

Return Codes

Success

- `XR_SUCCESS`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`

14.36.1. Overview

This extension allows persistence and retrieval of spatial anchors sharing and localization across application sessions on a device. Spatial anchors persisted during an application session on a device will only be able to be retrieved during sessions of that same application on the same device. This extension requires `XR_MSFT_spatial_anchor` to also be enabled.

14.36.2. Spatial Anchor Store Connection

The XrSpatialAnchorStoreConnectionMSFT handle represents a connection to the spatial anchor store and is used by the application to perform operations on the spatial anchor store such as:

- Persisting and unpersisting of spatial anchors.
- Enumeration of currently persisted anchors.
- Clearing the spatial anchor store of all anchors.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XR_DEFINE_HANDLE(XrSpatialAnchorStoreConnectionMSFT)
```

The application **can** use the xrCreateSpatialAnchorStoreConnectionMSFT function to create an handle to the spatial anchor store. The application **can** use this handle to interact with the spatial anchor store in order to persist anchors across application sessions.

The xrCreateSpatialAnchorStoreConnectionMSFT function **may** be a slow operation and therefore **should** be invoked from a non-timing critical thread.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrCreateSpatialAnchorStoreConnectionMSFT(
    XrSession                                   session,
    XrSpatialAnchorStoreConnectionMSFT*         spatialAnchorStore);
```

Parameter Descriptions

- `session` is the XrSession the anchor was created with.
- `spatialAnchorStore` is a pointer to the XrSpatialAnchorStoreConnectionMSFT handle.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to calling xrCreateSpatialAnchorStoreConnectionMSFT
- session **must** be a valid XrSession handle
- spatialAnchorStore **must** be a pointer to an XrSpatialAnchorStoreConnectionMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The application **can** use the xrDestroySpatialAnchorStoreConnectionMSFT function to destroy an anchor store connection.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrDestroySpatialAnchorStoreConnectionMSFT(
    XrSpatialAnchorStoreConnectionMSFT          spatialAnchorStore);
```

Parameter Descriptions

- spatialAnchorStore is the XrSpatialAnchorStoreConnectionMSFT to be destroyed.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to calling xrDestroySpatialAnchorStoreConnectionMSFT
- spatialAnchorStore **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle

Thread Safety

- Access to spatialAnchorStore, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE

14.36.3. Persist Spatial Anchor

The application **can** use the xrPersistSpatialAnchorMSFT function to persist a spatial anchor in the spatial anchor store for this application. The given XrSpatialAnchorPersistenceInfoMSFT ::spatialAnchorPersistenceName will be the string to retrieve the spatial anchor from the Spatial Anchor store or subsequently remove the record of this spatial anchor from the store. This name will uniquely identify the spatial anchor for the current application. If there is already a spatial anchor of the same name persisted in the spatial anchor store, the existing spatial anchor will be replaced and xrPersistSpatialAnchorMSFT **must** return XR_SUCCESS.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrPersistSpatialAnchorMSFT(
    XrSpatialAnchorStoreConnectionMSFT          spatialAnchorStore,
    const XrSpatialAnchorPersistenceInfoMSFT*   spatialAnchorPersistenceInfo);
```

Parameter Descriptions

- `spatialAnchorStore` is the XrSpatialAnchorStoreConnectionMSFT with which to persist the XrSpatialAnchorPersistenceInfoMSFT::`spatialAnchor`.
- `spatialAnchorPersistenceInfo` is a pointer to XrSpatialAnchorPersistenceInfoMSFT structure to specify the anchor and its name to persist.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor_persistence` extension **must** be enabled prior to calling xrPersistSpatialAnchorMSFT
- `spatialAnchorStore` **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle
- `spatialAnchorPersistenceInfo` **must** be a pointer to a valid XrSpatialAnchorPersistenceInfoMSFT structure

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ANCHOR_NAME_INVALID_MSFT`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorPersistenceNameMSFT structure is the name associated with the XrSpatialAnchorMSFT in the spatial anchor store. It is used to perform persist and unpersist on an `name` in the spatial anchor store.

The XrSpatialAnchorPersistenceNameMSFT structure is defined as:

```
// Provided by XR_MSFT_spatial_anchor_persistence
typedef struct XrSpatialAnchorPersistenceNameMSFT {
    char    name[XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_MSFT];
} XrSpatialAnchorPersistenceNameMSFT;
```

Member Descriptions

- `name` is a null terminated character array of size `XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_MSFT`.

If an XrSpatialAnchorPersistenceNameMSFT with an empty `name` value is passed to any function as a parameter, that function **must** return `XR_ERROR_SPATIAL_ANCHOR_NAME_INVALID_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor_persistence` extension **must** be enabled prior to using XrSpatialAnchorPersistenceNameMSFT
- `name` **must** be a null-terminated UTF-8 string whose length is less than or equal to `XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_MSFT`

The XrSpatialAnchorPersistenceInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_spatial_anchor_persistence
typedef struct XrSpatialAnchorPersistenceInfoMSFT {
    XrStructureType                     type;
    const void*                         next;
    XrSpatialAnchorPersistenceNameMSFT  spatialAnchorPersistenceName;
    XrSpatialAnchorMSFT                 spatialAnchor;
} XrSpatialAnchorPersistenceInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `spatialAnchorPersistenceName` is an XrSpatialAnchorPersistenceNameMSFT containing the name associated with the XrSpatialAnchorMSFT in the spatial anchor store.
- `spatialAnchor` is the XrSpatialAnchorMSFT that the application wishes to perform persistence operations on.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to using XrSpatialAnchorPersistenceInfoMSFT
- type **must** be XR_TYPE_SPATIAL_ANCHOR_PERSISTENCE_INFO_MSFT
- next **must** be NULL or a valid pointer to the next structure in a structure chain
- spatialAnchorPersistenceName **must** be a valid XrSpatialAnchorPersistenceNameMSFT structure
- spatialAnchor **must** be a valid XrSpatialAnchorMSFT handle

The application **can** use the xrEnumeratePersistedSpatialAnchorNamesMSFT function to enumerate the names of all spatial anchors currently persisted in the spatial anchor store for this application. This function follows the two-call idiom for filling the spatialAnchorNames.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrEnumeratePersistedSpatialAnchorNamesMSFT(
    XrSpatialAnchorStoreConnectionMSFT          spatialAnchorStore,
    uint32_t                                    spatialAnchorNameCapacityInput,
    uint32_t*                                   spatialAnchorNameCountOutput,
    XrSpatialAnchorPersistenceNameMSFT*         spatialAnchorNames);
```

Parameter Descriptions

- spatialAnchorStore is the XrSpatialAnchorStoreConnectionMSFT anchor store to perform the enumeration operation on.
- spatialAnchorNameCapacityInput is the capacity of the spatialAnchorNames array, or 0 to indicate a request to retrieve the required capacity.
- spatialAnchorNameCountOutput is filled in by the runtime with the count of anchor names written or the required capacity in the case that spatialAnchorNameCapacityInput is insufficient.
- spatialAnchorNames is a pointer to an array of XrSpatialAnchorPersistenceNameMSFT structures, but **can** be NULL if propertyCapacityInput is 0.
- See the Buffer Size Parameters section for a detailed description of retrieving the required spatialAnchorNames size.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to calling xrEnumeratePersistedSpatialAnchorNamesMSFT
- spatialAnchorStore **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle
- spatialAnchorNameCountOutput **must** be a pointer to a uint32_t value
- If spatialAnchorNameCapacityInput is not 0, spatialAnchorNames **must** be a pointer to an array of spatialAnchorNameCapacityInput XrSpatialAnchorPersistenceNameMSFT structures

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SIZE_INSUFFICIENT
- XR_ERROR_VALIDATION_FAILURE

The application **can** use the xrCreateSpatialAnchorFromPersistedNameMSFT function to create a XrSpatialAnchorMSFT from the spatial anchor store. If the XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT::spatialAnchorPersistenceName provided does not correspond to a currently stored anchor (i.e. the list of spatial anchor names returned from xrEnumeratePersistedSpatialAnchorNamesMSFT), the function **must** return XR_ERROR_SPATIAL_ANCHOR_NAME_NOT_FOUND_MSFT.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrCreateSpatialAnchorFromPersistedNameMSFT(
    XrSession                                       session,
    const XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT* spatialAnchorCreateInfo,
    XrSpatialAnchorMSFT*                            spatialAnchor);
```

Parameter Descriptions

- `session` is a handle to an XrSession previously created with xrCreateSession.
- `spatialAnchorCreateInfo` is a pointer to the XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT.
- `spatialAnchor` is a pointer to an XrSpatialAnchorMSFT handle that will be set by the runtime on successful load.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor_persistence` extension **must** be enabled prior to calling xrCreateSpatialAnchorFromPersistedNameMSFT
- `session` **must** be a valid XrSession handle
- `spatialAnchorCreateInfo` **must** be a pointer to a valid XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT structure
- `spatialAnchor` **must** be a pointer to an XrSpatialAnchorMSFT handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_SPATIAL_ANCHOR_NAME_INVALID_MSFT`
- `XR_ERROR_SPATIAL_ANCHOR_NAME_NOT_FOUND_MSFT`
- `XR_ERROR_VALIDATION_FAILURE`

The XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT structure is defined as:

```
// Provided by XR_MSFT_spatial_anchor_persistence
typedef struct XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT {
    XrStructureType                         type;
    const void*                             next;
    XrSpatialAnchorStoreConnectionMSFT    spatialAnchorStore;
    XrSpatialAnchorPersistenceNameMSFT    spatialAnchorPersistenceName;
} XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR.
- `spatialAnchorStore` is the XrSpatialAnchorStoreConnectionMSFT from which the spatial anchor will be loaded from.
- `spatialAnchorPersistenceName` is the XrSpatialAnchorPersistenceNameMSFT associated with the XrSpatialAnchorMSFT in the spatial anchor store. This name is used to create an XrSpatialAnchorMSFT handle from a spatial anchor persisted in the spatial anchor store.

The `spatialAnchorPersistenceName` is a character array of maximum size `XR_MAX_SPATIAL_ANCHOR_NAME_SIZE_MSFT`, which **must** include a null terminator and **must** not be empty (i.e. the first element is the null terminator). If an empty `spatialAnchorPersistenceName` value is passed to any function as a parameter, that function **must** return `XR_ERROR_SPATIAL_ANCHOR_NAME_INVALID_MSFT`.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_anchor_persistence` extension **must** be enabled prior to using XrSpatialAnchorFromPersistedAnchorCreateInfoMSFT
- `type` **must** be `XR_TYPE_SPATIAL_ANCHOR_FROM_PERSISTED_ANCHOR_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `spatialAnchorStore` **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle
- `spatialAnchorPersistenceName` **must** be a valid XrSpatialAnchorPersistenceNameMSFT structure

The application **can** use the xrUnpersistSpatialAnchorMSFT function to remove the record of the anchor in the spatial anchor store. This operation will not affect any XrSpatialAnchorMSFT handles previously created. If the `spatialAnchorPersistenceName` provided does not correspond to a currently

stored anchor, the function **must** return XR_ERROR_SPATIAL_ANCHOR_NAME_NOT_FOUND_MSFT.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrUnpersistSpatialAnchorMSFT(
    XrSpatialAnchorStoreConnectionMSFT          spatialAnchorStore,
    const XrSpatialAnchorPersistenceNameMSFT*   spatialAnchorPersistenceName);
```

Parameter Descriptions

- spatialAnchorStore is an XrSpatialAnchorStoreConnectionMSFT anchor store to perform the unpersist operation on.
- spatialAnchorPersistenceName is a pointer to the XrSpatialAnchorPersistenceNameMSFT.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to calling xrUnpersistSpatialAnchorMSFT
- spatialAnchorStore **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle
- spatialAnchorPersistenceName **must** be a pointer to a valid XrSpatialAnchorPersistenceNameMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_SPATIAL_ANCHOR_NAME_INVALID_MSFT
- XR_ERROR_SPATIAL_ANCHOR_NAME_NOT_FOUND_MSFT
- XR_ERROR_VALIDATION_FAILURE

The application **can** use the xrClearSpatialAnchorStoreMSFT function to remove all spatial anchors from the spatial anchor store for this application. The function only removes the record of the spatial anchors in the store but does not affect any XrSpatialAnchorMSFT handles previously loaded in the current session.

```
// Provided by XR_MSFT_spatial_anchor_persistence
XrResult xrClearSpatialAnchorStoreMSFT(
    XrSpatialAnchorStoreConnectionMSFT          spatialAnchorStore);
```

Parameter Descriptions

- spatialAnchorStore is XrSpatialAnchorStoreConnectionMSFT to perform the clear operation on.

Valid Usage (Implicit)

- The XR_MSFT_spatial_anchor_persistence extension **must** be enabled prior to calling xrClearSpatialAnchorStoreMSFT
- spatialAnchorStore **must** be a valid XrSpatialAnchorStoreConnectionMSFT handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

New Object Types

- XrSpatialAnchorStoreConnectionMSFT

New Flag Types

New Enum Constants

- XR_TYPE_SPATIAL_ANCHOR_PERSISTENCE_INFO_MSFT

Overview

This extension enables applications to interop between XrSpace handles and other Windows Mixed Reality device platform libraries or APIs. These libraries represent a spatially tracked point, also known as a "spatial graph node", with a GUID value. This extension enables applications to create XrSpace handles from spatial graph nodes. Applications can also try to get a spatial graph node from an XrSpace handle.

14.37.1. Create XrSpace from Spatial Graph Node

The xrCreateSpatialGraphNodeSpaceMSFT function creates an XrSpace handle for a given spatial graph node type and ID.

```
// Provided by XR_MSFT_spatial_graph_bridge
XrResult xrCreateSpatialGraphNodeSpaceMSFT(
    XrSession                                     session,
    const XrSpatialGraphNodeSpaceCreateInfoMSFT* createInfo,
    XrSpace*                                      space);
```

Parameter Descriptions

- `session` is the XrSession which will use the created space.
- `createInfo` is an XrSpatialGraphNodeSpaceCreateInfoMSFT specifying the space to be created.
- `space` is the returned XrSpace handle for the given spatial node ID.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to calling xrCreateSpatialGraphNodeSpaceMSFT
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialGraphNodeSpaceCreateInfoMSFT structure
- `space` **must** be a pointer to an XrSpace handle

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_LIMIT_REACHED
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_POSE_INVALID
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

The XrSpatialGraphNodeSpaceCreateInfoMSFT structure is used with xrCreateSpatialGraphNodeSpaceMSFT to create an XrSpace handle for a given spatial node type and node ID.

```
// Provided by XR_MSFT_spatial_graph_bridge
typedef struct XrSpatialGraphNodeSpaceCreateInfoMSFT {
    XrStructureType               type;
    const void*                   next;
    XrSpatialGraphNodeTypeMSFT    nodeType;
    uint8_t                       nodeId[XR_GUID_SIZE_MSFT];
    XrPosef                       pose;
} XrSpatialGraphNodeSpaceCreateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain. No such structures are defined in core OpenXR or this extension.
- `nodeType` is an XrSpatialGraphNodeTypeMSFT specifying the spatial node type.
- `nodeId` is a global unique identifier (a.k.a. GUID or 16 byte array), representing the spatial node that is being tracked.
- `pose` is an XrPosef defining the position and orientation of the new space's origin within the natural reference frame of the spatial graph node.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to using XrSpatialGraphNodeSpaceCreateInfoMSFT
- `type` **must** be `XR_TYPE_SPATIAL_GRAPH_NODE_SPACE_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `nodeType` **must** be a valid XrSpatialGraphNodeTypeMSFT value

The enum XrSpatialGraphNodeTypeMSFT describes the types of spatial graph nodes.

```
// Provided by XR_MSFT_spatial_graph_bridge
typedef enum XrSpatialGraphNodeTypeMSFT {
    XR_SPATIAL_GRAPH_NODE_TYPE_STATIC_MSFT = 1,
    XR_SPATIAL_GRAPH_NODE_TYPE_DYNAMIC_MSFT = 2,
    XR_SPATIAL_GRAPH_NODE_TYPE_MAX_ENUM_MSFT = 0x7FFFFFFF
} XrSpatialGraphNodeTypeMSFT;
```

There are two types of spatial graph nodes: static and dynamic.

Static spatial nodes track the pose of a fixed location in the world relative to reference spaces. The tracking of static nodes **may** slowly adjust the pose over time for better accuracy but the pose is relatively stable in the short term, such as between rendering frames. For example, a QR code tracking library can use a static node to represent the location of the tracked QR code. Static spatial nodes are represented by `XR_SPATIAL_GRAPH_NODE_TYPE_STATIC_MSFT`.

Dynamic spatial nodes track the pose of a physical object that moves continuously relative to reference spaces. The pose of dynamic spatial nodes **can** be very different within the duration of a rendering frame. It is important for the application to use the correct timestamp to query the space location using xrLocateSpace. For example, a color camera mounted in front of a HMD is also tracked by the HMD so

a web camera library can use a dynamic node to represent the camera location. Dynamic spatial nodes are represented by XR_SPATIAL_GRAPH_NODE_TYPE_DYNAMIC_MSFT.

14.37.2. Create Spatial Graph Node Binding from XrSpace

The XrSpatialGraphNodeBindingMSFT handle represents a binding to a spatial graph node. This handle allows an application to get a spatial graph node GUID from an XrSpace to use in other Windows Mixed Reality device platform libraries or APIs.

The runtime **must** remember the spatial graph node and track it for the lifetime of the XrSpatialGraphNodeBindingMSFT handle. When the XrSpatialGraphNodeBindingMSFT handle is destroyed then the runtime's tracking system **may** forget about the spatial graphic node and stop tracking it.

```
// Provided by XR_MSFT_spatial_graph_bridge
XR_DEFINE_HANDLE(XrSpatialGraphNodeBindingMSFT)
```

The xrTryCreateSpatialGraphStaticNodeBindingMSFT function tries to create a binding to the best spatial graph static node relative to the given location and returns an XrSpatialGraphNodeBindingMSFT handle.

```
// Provided by XR_MSFT_spatial_graph_bridge
XrResult xrTryCreateSpatialGraphStaticNodeBindingMSFT(
    XrSession                                       session,
    const XrSpatialGraphStaticNodeBindingCreateInfoMSFT* createInfo,
    XrSpatialGraphNodeBindingMSFT*                  nodeBinding);
```

Parameter Descriptions

- session is the specified XrSession.
- createInfo is the XrSpatialGraphStaticNodeBindingCreateInfoMSFT input structure.
- nodeBinding is the XrSpatialGraphNodeBindingMSFT output structure.

The runtime **may** return XR_SUCCESS and set nodeBinding to XR_NULL_HANDLE if it is unable to create a spatial graph static node binding. This may happen when the given XrSpace cannot be properly tracked at the moment. The application can retry creating the XrSpatialGraphNodeBindingMSFT handle again after a reasonable period of time when tracking is regained.

The xrTryCreateSpatialGraphStaticNodeBindingMSFT function **may** be a slow operation and therefore **should** be invoked from a non-timing critical thread.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to calling xrTryCreateSpatialGraphStaticNodeBindingMSFT
- `session` **must** be a valid XrSession handle
- `createInfo` **must** be a pointer to a valid XrSpatialGraphStaticNodeBindingCreateInfoMSFT structure
- `nodeBinding` **must** be a pointer to an XrSpatialGraphNodeBindingMSFT handle

Return Codes

Success

- `XR_SUCCESS`
- `XR_SESSION_LOSS_PENDING`

Failure

- `XR_ERROR_FUNCTION_UNSUPPORTED`
- `XR_ERROR_HANDLE_INVALID`
- `XR_ERROR_INSTANCE_LOST`
- `XR_ERROR_LIMIT_REACHED`
- `XR_ERROR_OUT_OF_MEMORY`
- `XR_ERROR_POSE_INVALID`
- `XR_ERROR_RUNTIME_FAILURE`
- `XR_ERROR_SESSION_LOST`
- `XR_ERROR_TIME_INVALID`
- `XR_ERROR_VALIDATION_FAILURE`

XrSpatialGraphStaticNodeBindingCreateInfoMSFT is an input structure for xrTryCreateSpatialGraphStaticNodeBindingMSFT.

```
// Provided by XR_MSFT_spatial_graph_bridge
typedef struct XrSpatialGraphStaticNodeBindingCreateInfoMSFT {
    XrStructureType    type;
    const void*        next;
    XrSpace            space;
    XrPosef            poseInSpace;
    XrTime             time;
} XrSpatialGraphStaticNodeBindingCreateInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `space` is a handle to the XrSpace in which `poseInSpace` is specified.
- `poseInSpace` is the XrPosef within `space` at `time`.
- `time` is the `XrTime` at which `poseInSpace` will be evaluated within `space`.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to using XrSpatialGraphStaticNodeBindingCreateInfoMSFT
- `type` **must** be `XR_TYPE_SPATIAL_GRAPH_STATIC_NODE_BINDING_CREATE_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain
- `space` **must** be a valid XrSpace handle

The xrDestroySpatialGraphNodeBindingMSFT function releases the `nodeBinding` and the underlying resources.

```
// Provided by XR_MSFT_spatial_graph_bridge
XrResult xrDestroySpatialGraphNodeBindingMSFT(
    XrSpatialGraphNodeBindingMSFT               nodeBinding);
```

Parameter Descriptions

- `nodeBinding` is an XrSpatialGraphNodeBindingMSFT previously created by xrTryCreateSpatialGraphStaticNodeBindingMSFT.

Valid Usage (Implicit)

- The XR_MSFT_spatial_graph_bridge extension **must** be enabled prior to calling xrDestroySpatialGraphNodeBindingMSFT
- nodeBinding **must** be a valid XrSpatialGraphNodeBindingMSFT handle

Thread Safety

- Access to nodeBinding, and any child handles, **must** be externally synchronized

Return Codes

Success

- XR_SUCCESS

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_RUNTIME_FAILURE

Get spatial graph node binding properties

The xrGetSpatialGraphNodeBindingPropertiesMSFT function retrieves the spatial graph node GUID and the pose in the node space from an XrSpatialGraphNodeBindingMSFT handle.

```
// Provided by XR_MSFT_spatial_graph_bridge
XrResult xrGetSpatialGraphNodeBindingPropertiesMSFT(
    XrSpatialGraphNodeBindingMSFT                nodeBinding,
    const XrSpatialGraphNodeBindingPropertiesGetInfoMSFT* getInfo,
    XrSpatialGraphNodeBindingPropertiesMSFT*     properties);
```

Parameter Descriptions

- nodeBinding is an XrSpatialGraphNodeBindingMSFT previously created by xrTryCreateSpatialGraphStaticNodeBindingMSFT.
- getInfo is a pointer to an XrSpatialGraphNodeBindingPropertiesGetInfoMSFT input structure.
- properties is a pointer to an XrSpatialGraphNodeBindingPropertiesMSFT output structure.

Valid Usage (Implicit)

- The XR_MSFT_spatial_graph_bridge extension **must** be enabled prior to calling xrGetSpatialGraphNodeBindingPropertiesMSFT
- nodeBinding **must** be a valid XrSpatialGraphNodeBindingMSFT handle
- If getInfo is not NULL, getInfo **must** be a pointer to a valid XrSpatialGraphNodeBindingPropertiesGetInfoMSFT structure
- properties **must** be a pointer to an XrSpatialGraphNodeBindingPropertiesMSFT structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_OUT_OF_MEMORY
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_VALIDATION_FAILURE

XrSpatialGraphNodeBindingPropertiesGetInfoMSFT is an input structure for xrGetSpatialGraphNodeBindingPropertiesMSFT.

```
// Provided by XR_MSFT_spatial_graph_bridge
typedef struct XrSpatialGraphNodeBindingPropertiesGetInfoMSFT {
    XrStructureType    type;
    const void*        next;
} XrSpatialGraphNodeBindingPropertiesGetInfoMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to using XrSpatialGraphNodeBindingPropertiesGetInfoMSFT
- `type` **must** be `XR_TYPE_SPATIAL_GRAPH_NODE_BINDING_PROPERTIES_GET_INFO_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

XrSpatialGraphNodeBindingPropertiesMSFT is an output structure for xrGetSpatialGraphNodeBindingPropertiesMSFT.

```
// Provided by XR_MSFT_spatial_graph_bridge
typedef struct XrSpatialGraphNodeBindingPropertiesMSFT {
    XrStructureType    type;
    void*              next;
    uint8_t            nodeId[XR_GUID_SIZE_MSFT];
    XrPosef            poseInNodeSpace;
} XrSpatialGraphNodeBindingPropertiesMSFT;
```

Member Descriptions

- `type` is the XrStructureType of this structure.
- `next` is `NULL` or a pointer to the next structure in a structure chain.
- `nodeId` is a global unique identifier (a.k.a. GUID or 16 byte array), representing the spatial graph node.
- `poseInNodeSpace` is an XrPosef defining the pose in the underlying node's space.

Valid Usage (Implicit)

- The `XR_MSFT_spatial_graph_bridge` extension **must** be enabled prior to using XrSpatialGraphNodeBindingPropertiesMSFT
- `type` **must** be `XR_TYPE_SPATIAL_GRAPH_NODE_BINDING_PROPERTIES_MSFT`
- `next` **must** be `NULL` or a valid pointer to the next structure in a structure chain

Overview

This extension allows an application to create an `UNBOUNDED_MSFT` reference space. This reference space enables the viewer to move freely through a complex environment, often many meters from where they started, while always optimizing for coordinate system stability near the viewer. This is done by allowing the origin of the reference space to drift as necessary to keep the viewer's coordinates relative to the space's origin stable.

To create an `UNBOUNDED_MSFT` reference space, the application **can** pass `XR_REFERENCE_SPACE_TYPE_UNBOUNDED_MSFT` to xrCreateReferenceSpace.

The `UNBOUNDED_MSFT` reference space establishes a world-locked origin, gravity-aligned to exclude pitch and roll, with +Y up, +X to the right, and -Z forward. This space begins with an arbitrary initial position

and orientation, which the runtime **may** define to be either the initial position at app launch or some other initial zero position. Unlike a `STAGE` reference space, the runtime **may** place the origin of an `UNBOUNDED_MSFT` reference space at any height, rather than fixing it at the floor. This is because the viewer may move through various rooms and levels of their environment, each of which has a different floor height. Runtimes **should** not automatically adjust the position of the origin when the viewer moves to a room with a different floor height.

`UNBOUNDED_MSFT` space is useful when an app needs to render **world-scale** content that spans beyond the bounds of a single `STAGE`, for example, an entire floor or multiple floors of a building.

An `UNBOUNDED_MSFT` space maintains stability near the viewer by slightly adjusting its origin over time. The runtime **must** not queue the XrEventDataReferenceSpaceChangePending event in response to these minor adjustments.

When views, controllers or other spaces experience tracking loss relative to the `UNBOUNDED_MSFT` space, runtimes **should** continue to provide inferred or last-known `position` and `orientation` values. These inferred poses can, for example, be based on neck model updates, inertial dead reckoning, or a last-known position, so long as it is still reasonable for the application to use that pose. While a runtime is providing position data, it **must** continue to set `XR_SPACE_LOCATION_POSITION_VALID_BIT` and `XR_VIEW_STATE_POSITION_VALID_BIT` but it **can** clear `XR_SPACE_LOCATION_POSITION_TRACKED_BIT` and `XR_VIEW_STATE_POSITION_TRACKED_BIT` to indicate that the position is inferred or last-known in this way.

When tracking is recovered, runtimes **should** snap the pose of other spaces back into position relative to the `UNBOUNDED_MSFT` space's original origin. However, if tracking recovers into a new tracking volume in which the original origin can no longer be located (e.g. the viewer moved through a dark hallway and regained tracking in a new room), the runtime **may** recenter the origin arbitrarily, for example moving the origin to coincide with the viewer. If such recentering occurs, the runtime **must** queue the XrEventDataReferenceSpaceChangePending event with `poseValid` set to false.

If the viewer moves far enough away from the origin of an `UNBOUNDED_MSFT` reference space that floating point error would introduce noticeable error when locating the viewer within that space, the runtime **may** recenter the space's origin to a new location closer to the viewer. If such recentering occurs, the runtime **must** queue the XrEventDataReferenceSpaceChangePending event with `poseValid` set to true.

Runtimes **must** support the `UNBOUNDED_MSFT` reference space when this extension is enabled.

Extension and Version Dependencies

OpenXR 1.0

Deprecation State

- *Deprecated* without replacement

Overview

This extension enables the integration of the Android session lifecycle and an OpenXR runtime session state. Some OpenXR runtimes may require this extension to transition the application to the session READY or STOPPING state.

Applications that run on an Android system with this extension enabled have a different OpenXR Session state flow.

On Android, it is the Android Activity lifecycle that will dictate when the system is ready for the application to begin or end its session, not the runtime.

When XR_OCULUS_android_session_state is enabled, the following changes are made to Session State handling:

- The runtime does not determine when the application's session should be moved to the ready state, XR_SESSION_STATE_READY. The application should not wait to receive the XR_SESSION_STATE_READY session state changed event before beginning a session. Instead, the application should begin their session once there is a surface and the activity is resumed.
- The application should not call xrRequestExitSession to request the session move to the stopping state, XR_SESSION_STATE_STOPPING. xrRequestExitSession will return XR_ERROR_VALIDATION_FAILURE if called.
- The application should not wait to receive the XR_SESSION_STATE_STOPPING session state changed event before ending a session. Instead, the application should end its session once the surface is destroyed or the activity is paused.
- The runtime will not transition to XR_SESSION_STATE_READY or XR_SESSION_STATE_STOPPING as the state is implicit from the Android activity and surface lifecycles.

Android Activity life cycle

An Android Activity can only be in the session running state while the activity is in the resumed state. The following shows how beginning and ending an XR session fits into the Android Activity life cycle.

```
1.  VrActivity::onCreate() <---------+
2.  VrActivity::onStart() <-------+  |
3.  VrActivity::onResume() <---+  |  |
4.  xrBeginSession()           |  |  |
5.  xrEndSession()             |  |  |
6.  VrActivity::onPause() -----+  |  |
7.  VrActivity::onStop() ---------+  |
8.  VrActivity::onDestroy() ---------+
```

Android Surface life cycle

An Android Activity can only be in the session running state while there is a valid Android Surface. The following shows how beginning and ending an XR session fits into the Android Surface life cycle.

```
1.  VrActivity::surfaceCreated() <----+
2.  VrActivity::surfaceChanged()      |
3.  xrBeginSession()                  |
4.  xrEndSession()                    |
5.  VrActivity::surfaceDestroyed() ---+
```

Note that the life cycle of a surface is not necessarily tightly coupled with the life cycle of an activity. These two life cycles may interleave in complex ways. Usually surfaceCreated() is called after

onResume() and surfaceDestroyed() is called between onPause() and onDestroy(). However, this is not guaranteed and, for instance, surfaceDestroyed() may be called after onDestroy() or even before onPause().

An Android Activity is only in the resumed state with a valid Android Surface between surfaceChanged() or onResume(), whichever comes last, and surfaceDestroyed() or onPause(), whichever comes first. In other words, a XR application will typically begin the session from surfaceChanged() or onResume(), whichever comes last, and end the session from surfaceDestroyed() or onPause(), whichever comes first.

14.40.1. Overview

This extension enables applications to detect hand gestures.

14.40.2. Get gesture detection data

The xrGetHandGestureQCOM function is defined as:

```
// Provided by XR_QCOM_hand_tracking_gesture
XrResult xrGetHandGestureQCOM(
    XrHandTrackerEXT                            handTracker,
    XrTime                                      time,
    XrHandGestureQCOM*                          handGesture);
```

Parameter Descriptions

- handTracker is an XrHandTrackerEXT previously created by xrCreateHandTrackerEXT.
- time is the XrTime of gesture detection.
- handGesture is a pointer to XrHandGestureQCOM and returns the current gesture detection data.

The xrGetHandGestureQCOM function retrieves the hand gesture data at a given time.

Valid Usage (Implicit)

- The XR_QCOM_hand_tracking_gesture extension **must** be enabled prior to calling xrGetHandGestureQCOM
- handTracker **must** be a valid XrHandTrackerEXT handle
- handGesture **must** be a pointer to an XrHandGestureQCOM structure

Return Codes

Success

- XR_SUCCESS
- XR_SESSION_LOSS_PENDING

Failure

- XR_ERROR_FUNCTION_UNSUPPORTED
- XR_ERROR_HANDLE_INVALID
- XR_ERROR_INSTANCE_LOST
- XR_ERROR_RUNTIME_FAILURE
- XR_ERROR_SESSION_LOST
- XR_ERROR_TIME_INVALID

The XrHandGestureQCOM structure is defined as:

```
// Provided by XR_QCOM_hand_tracking_gesture
typedef struct XrHandGestureQCOM {
    XrHandGestureTypeQCOM    gesture;
    float                    gestureRatio;
    float                    flipRatio;
} XrHandGestureQCOM;
```

Member Descriptions

- `gesture` is the XrHandGestureTypeQCOM detected.
- `gestureRatio` is a value between 0 and 1 indicating how much the gesture is applied.
- `flipRatio` is a value between -1 and 1 indicating if the hand gesture is detected from the back, from the front, or in between. The value is 1 when the palm is facing the user and is -1 when the palm is directed toward the environment. It represents the normalized dot product between the palm normal and the palm-to-user vector.

XrHandGestureQCOM structure returns the state of the gesture detection.

Valid Usage (Implicit)

- The `XR_QCOM_hand_tracking_gesture` extension **must** be enabled prior to using XrHandGestureQCOM
- `gesture` **must** be a valid XrHandGestureTypeQCOM value

The XrHandGestureTypeQCOM enumeration identifies the different types of gestures.

```
// Provided by XR_QCOM_hand_tracking_gesture
typedef enum XrHandGestureTypeQCOM {
    XR_HAND_GESTURE_TYPE_UNKNOWN_QCOM = -1,
    XR_HAND_GESTURE_TYPE_OPEN_HAND_QCOM = 0,
    XR_HAND_GESTURE_TYPE_GRAB_QCOM = 2,
    XR_HAND_GESTURE_TYPE_PINCH_QCOM = 7,
    XR_HAND_GESTURE_TYPE_MAX_ENUM_QCOM = 0x7FFFFFFF
} XrHandGestureTypeQCOM;
```

Enum	Description
XR_HAND_GESTURE_TYPE_UNKNOWN_QCOM	Indicates that no gesture can be detected.
XR_HAND_GESTURE_TYPE_OPEN_HAND_QCOM	The open hand gesture is a neutral position. It is performed by extending the hand with the fingers opened and the palm away from the user.
XR_HAND_GESTURE_TYPE_GRAB_QCOM	The grab gesture is performed by placing the hand in front of the user and closing the hand into a fist.
XR_HAND_GESTURE_TYPE_PINCH_QCOM	The pinch gesture is performed by touching the tip of the thumb to the tip of the index finger while extending the remaining fingers.

14.40.3. New Commands

- xrGetHandGestureQCOM

14.40.4. New Structures

- XrHandGestureQCOM

14.41.1. Overview

This extension adds a new view configuration type - `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_QUAD_VARJO` to XrViewConfigurationType which can be returned by xrEnumerateViewConfigurations to indicate that the runtime supports 4 viewports.

In this configuration each eye consists of two viewports of which one is smaller (in terms of field of view) of the other and fully included inside of the larger FoV one. The small FoV viewport however can have a higher resolution with respect to the same field of view in the outer viewport. The motivation is special hardware which superimposes a smaller, high resolution screen for the fovea region onto a larger screen for the periphery.

The runtime guarantees that the inner viewport of each eye is fully inside of the outer viewport.

To enumerate the 4 views xrEnumerateViewConfigurationViews can be used. The first two views (XrViewConfigurationView) will be for the left and right eyes for the outer viewport. The views 2 and 3 are for the left and right eyes for the inner viewport.

The relative position of the inner views relative to the outer views can change at run-time.

The runtime **must** set `pose` for view 0 and 2 to be identical and **must** set `pose` for view 1 and 3 to be be identical when application calls xrLocateViews.

The runtime might blend between the views at the edges, so the application should not omit the inner field of view from being generated in the outer view.

New Object Types

New Flag Types

New Enum Constants

XrViewConfigurationType enumeration is extended with:

- `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_QUAD_VARJO`

New Enums

New Structures

New Functions

Issues

Version History

- Revision 1, 2019-04-16 (Sergiy Dubovik)
  - Initial draft
- Revision 2, 2024-06-13 (Denny Rönngren)
  - Clarified that both views for each eye needs to have identical poses. This reflects the actual behavior in all known implementations.

Chapter 15. Core Revisions (Informative)

New minor versions of the OpenXR API are defined periodically by the Khronos OpenXR Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality promoted from extensions.

15.1. Version 1.1

15.1.1. OpenXR 1.1 Promotions

OpenXR version 1.1 promoted a number of key extensions into the core API:

- `XR_KHR_locate_spaces`
- `XR_KHR_maintenance1`
- `XR_EXT_hp_mixed_reality_controller`
- `XR_EXT_local_floor`
- `XR_EXT_palm_pose`
- `XR_EXT_samsung_odyssey_controller`
- `XR_EXT_uuid`
- `XR_BD_controller_interaction`
- `XR_FB_touch_controller_pro`
- `XR_HTC_vive_cosmos_controller_interaction`
- `XR_HTC_vive_focus3_controller_interaction`
- `XR_META_touch_controller_plus`
- `XR_ML_ml2_controller_interaction`
- `XR_VARJO_quad_views`

All differences in behavior between these extensions and the corresponding OpenXR 1.1 functionality are summarized below.

Differences Relative to `XR_EXT_local_floor`

The definition of this space was made more precise, and it was clarified that the mandatory support of this space does **not** dictate any particular quality of floor level estimation. Applications that can provide a head-relative interaction experience in the absence of a defined stage continue to use `LOCAL` space, while those that need higher quality assertions about floor level continue to use `STAGE` space or scene understanding extensions to detect floor level. The (mandatory) presence of this space when

enumerating reference spaces is a convenience for portability rather than an assertion that e.g. floor detection scene understanding has taken place or that the floor is inherently walkable.

Differences Relative to XR_EXT_palm_pose

The input identifier `palm_ext` defined in the extension has been renamed to `grip_surface` to more clearly describe its intended use and distinguish it from hand tracking.

Differences Relative to XR_VARJO_quad_views

The view configuration type enumerant `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_QUAD_VARJO` was renamed to `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_STEREO_WITH_FOVEATED_INSET`, to clarify that it is not vendor-specific nor the only way four views are possible. In OpenXR 1.1, a runtime **may** support `XR_VIEW_CONFIGURATION_TYPE_PRIMARY_STEREO_WITH_FOVEATED_INSET`, but this is **optional** like the other view configuration types. Use xrEnumerateViewConfigurations to determine if it is provided, rather than using the presence or absence of the extension.

Differences Relative to XR_FB_touch_controller_pro

The interaction profile path was changed from */interaction_profiles/facebook/touch_controller_pro* to */interaction_profiles/meta/touch_pro_controller*. Note the updated company name and different word order in the device name level.

The following input/output subpaths were renamed when changing to this new interaction profile path:

- *.../input/stylus_fb/force* → *.../input/stylus/force*
- *.../input/trigger/proximity_fb* → *.../input/trigger/proximity*
- *.../output/haptic_trigger_fb* → *.../output/haptic_trigger*
- *.../output/haptic_thumb_fb* → *.../output/haptic_thumb*
- *.../input/thumb_fb/proximity_fb* → *.../input/thumb_resting_surfaces/proximity*
  - Note this is a boolean-OR of the "thumbrest" location's proximity sensor as well as other proximity-sensitive regions.
- *.../input/trigger/curl_fb* → *.../input/trigger_curl/value*
- *.../input/trigger/slide_fb* → *.../input/trigger_slide/value*

The last two changes listed moved from being components on the trigger identifier to being independent identifiers in order to clarify how they relate to actions bound to other trigger components with regards to action priority.

Differences Relative to XR_META_touch_controller_plus

The interaction profile path was changed from */interaction_profiles/meta/touch_controller_plus* to */interaction_profiles/meta/touch_plus_controller*. Note the different word order in the device name

level.

The following input subpaths were renamed when changing to this new interaction profile path:

- *.../input/trigger/proximity_meta → .../input/trigger/proximity*
- *.../input/thumb_meta/proximity_meta → .../input/thumb_resting_surfaces/proximity*
  - Note this is a boolean-OR of the "thumbrest" location's proximity sensor as well as other proximity-sensitive regions.
- *.../input/trigger/curl_meta → .../input/trigger_curl/value*
- *.../input/trigger/slide_meta → .../input/trigger_slide/value*

15.1.2. Additional OpenXR 1.1 Changes

In addition to the promoted extensions described above, OpenXR 1.1 changed the following:

- Substantial clarifications in the input and fundamentals chapters, intended to be non-substantive.
- Added the following legacy interaction profiles to represent specific controllers shipped under the Oculus/Meta Touch name and previously grouped into a single Oculus Touch interaction profile:
  - */interaction_profiles/meta/touch_controller_rift_cv1* - Meta Touch Controller (Rift CV1) Profile
  - */interaction_profiles/meta/touch_controller_quest_1_rift_s* - Meta Touch Controller (Rift S / Quest 1) Profile
  - */interaction_profiles/meta/touch_controller_quest_2* - Meta Touch Controller (Quest 2) Profile

15.1.3. New Macros

- XR_API_VERSION_1_1

15.1.4. New Commands

- xrLocateSpaces

15.1.5. New Structures

- XrBoxf
- XrColor3f
- XrExtent3Df
- XrFrustumf
- XrSpaceLocationData
- XrSpaceLocations
- XrSpaceVelocityData

- XrSpacesLocateInfo
- XrSpheref
- XrUuid
- Extending XrSpaceLocations:
  - XrSpaceVelocities

15.1.6. New Enum Constants

- XR_UUID_SIZE
- Extending XrReferenceSpaceType:
  - XR_REFERENCE_SPACE_TYPE_LOCAL_FLOOR
- Extending XrResult:
  - XR_ERROR_EXTENSION_DEPENDENCY_NOT_ENABLED
  - XR_ERROR_PERMISSION_INSUFFICIENT
- Extending XrStructureType:
  - XR_TYPE_SPACES_LOCATE_INFO
  - XR_TYPE_SPACE_LOCATIONS
  - XR_TYPE_SPACE_VELOCITIES
- Extending XrViewConfigurationType:
  - XR_VIEW_CONFIGURATION_TYPE_PRIMARY_STEREO_WITH_FOVEATED_INSET

15.2. Loader Runtime and API Layer Negotiation Version 1.0

The OpenXR version 1.0.33 patch release included ratification of the runtime and API layer negotiation API, associated with the identifier XR_LOADER_VERSION_1_0, substantially unchanged from the unratified form previously described in the loader design document. This interface is intended for use only between the loader, runtimes, and API layers, and is not typically directly used by an application.

15.2.1. New Macros

- XR_API_LAYER_CREATE_INFO_STRUCT_VERSION
- XR_API_LAYER_INFO_STRUCT_VERSION
- XR_API_LAYER_MAX_SETTINGS_PATH_SIZE
- XR_API_LAYER_NEXT_INFO_STRUCT_VERSION
- XR_CURRENT_LOADER_API_LAYER_VERSION

- XR_CURRENT_LOADER_RUNTIME_VERSION
- XR_LOADER_INFO_STRUCT_VERSION
- XR_RUNTIME_INFO_STRUCT_VERSION

15.2.2. New Commands

- xrCreateApiLayerInstance
- xrNegotiateLoaderApiLayerInterface
- xrNegotiateLoaderRuntimeInterface

15.2.3. New Structures

- XrApiLayerCreateInfo
- XrApiLayerNextInfo
- XrNegotiateApiLayerRequest
- XrNegotiateLoaderInfo
- XrNegotiateRuntimeRequest

15.2.4. New Function Pointers

- PFN_xrCreateApiLayerInstance
- PFN_xrGetInstanceProcAddr

15.2.5. New Enums

- XrLoaderInterfaceStructs

15.3. Version 1.0

OpenXR version 1.0 defined the initial core API.

15.3.1. New Macros

- XR_API_VERSION_1_0
- XR_CURRENT_API_VERSION
- XR_DEFINE_ATOM
- XR_DEFINE_HANDLE
- XR_DEFINE_OPAQUE_64
- XR_EXTENSION_ENUM_BASE

- XR_EXTENSION_ENUM_STRIDE
- XR_FAILED
- XR_FREQUENCY_UNSPECIFIED
- XR_INFINITE_DURATION
- XR_MAKE_VERSION
- XR_MAX_EVENT_DATA_SIZE
- XR_MAY_ALIAS
- XR_MIN_COMPOSITION_LAYERS_SUPPORTED
- XR_MIN_HAPTIC_DURATION
- XR_NO_DURATION
- XR_NULL_HANDLE
- XR_NULL_PATH
- XR_NULL_SYSTEM_ID
- XR_SUCCEEDED
- XR_UNQUALIFIED_SUCCESS
- XR_VERSION_MAJOR
- XR_VERSION_MINOR
- XR_VERSION_PATCH

15.3.2. New Base Types

- `XrBool32`
- `XrDuration`
- `XrFlags64`
- `XrPath`
- `XrSystemId`
- `XrTime`
- `XrVersion`

15.3.3. New Object Types

- XrAction
- XrActionSet
- XrInstance
- XrSession

- XrSpace
- XrSwapchain

15.3.4. New Commands

- xrAcquireSwapchainImage
- xrApplyHapticFeedback
- xrAttachSessionActionSets
- xrBeginFrame
- xrBeginSession
- xrCreateAction
- xrCreateActionSet
- xrCreateActionSpace
- xrCreateInstance
- xrCreateReferenceSpace
- xrCreateSession
- xrCreateSwapchain
- xrDestroyAction
- xrDestroyActionSet
- xrDestroyInstance
- xrDestroySession
- xrDestroySpace
- xrDestroySwapchain
- xrEndFrame
- xrEndSession
- xrEnumerateApiLayerProperties
- xrEnumerateBoundSourcesForAction
- xrEnumerateEnvironmentBlendModes
- xrEnumerateInstanceExtensionProperties
- xrEnumerateReferenceSpaces
- xrEnumerateSwapchainFormats
- xrEnumerateSwapchainImages
- xrEnumerateViewConfigurationViews
- xrEnumerateViewConfigurations

- xrGetActionStateBoolean
- xrGetActionStateFloat
- xrGetActionStatePose
- xrGetActionStateVector2f
- xrGetCurrentInteractionProfile
- xrGetInputSourceLocalizedName
- xrGetInstanceProcAddr
- xrGetInstanceProperties
- xrGetReferenceSpaceBoundsRect
- xrGetSystem
- xrGetSystemProperties
- xrGetViewConfigurationProperties
- xrLocateSpace
- xrLocateViews
- xrPathToString
- xrPollEvent
- xrReleaseSwapchainImage
- xrRequestExitSession
- xrResultToString
- xrStopHapticFeedback
- xrStringToPath
- xrStructureTypeToString
- xrSuggestInteractionProfileBindings
- xrSyncActions
- xrWaitFrame
- xrWaitSwapchainImage

15.3.5. New Structures

- XrActionCreateInfo
- XrActionSetCreateInfo
- XrActionSpaceCreateInfo
- XrActionStateBoolean
- XrActionStateFloat

- XrActionStateGetInfo
- XrActionStatePose
- XrActionStateVector2f
- XrActionSuggestedBinding
- XrActionsSyncInfo
- XrActiveActionSet
- XrApiLayerProperties
- XrApplicationInfo
- XrBaseInStructure
- XrBaseOutStructure
- XrBoundSourcesForActionEnumerateInfo
- XrColor4f
- XrCompositionLayerBaseHeader
- XrCompositionLayerProjection
- XrCompositionLayerProjectionView
- XrCompositionLayerQuad
- XrEventDataBaseHeader
- XrEventDataBuffer
- XrEventDataEventsLost
- XrEventDataInstanceLossPending
- XrEventDataInteractionProfileChanged
- XrEventDataReferenceSpaceChangePending
- XrEventDataSessionStateChanged
- XrExtensionProperties
- XrExtent2Df
- XrExtent2Di
- XrFovf
- XrFrameBeginInfo
- XrFrameEndInfo
- XrFrameState
- XrFrameWaitInfo
- XrHapticActionInfo

- XrHapticBaseHeader
- XrHapticVibration
- XrInputSourceLocalizedNameGetInfo
- XrInstanceCreateInfo
- XrInstanceProperties
- XrInteractionProfileState
- XrInteractionProfileSuggestedBinding
- XrOffset2Df
- XrOffset2Di
- XrPosef
- XrQuaternionf
- XrRect2Df
- XrRect2Di
- XrReferenceSpaceCreateInfo
- XrSessionActionSetsAttachInfo
- XrSessionBeginInfo
- XrSessionCreateInfo
- XrSpaceLocation
- XrSwapchainCreateInfo
- XrSwapchainImageAcquireInfo
- XrSwapchainImageBaseHeader
- XrSwapchainImageReleaseInfo
- XrSwapchainImageWaitInfo
- XrSwapchainSubImage
- XrSystemGetInfo
- XrSystemGraphicsProperties
- XrSystemProperties
- XrSystemTrackingProperties
- XrVector2f
- XrVector3f
- XrVector4f
- XrView

- XrViewConfigurationProperties
- XrViewConfigurationView
- XrViewLocateInfo
- XrViewState
- Extending XrSpaceLocation:
  - XrSpaceVelocity

15.3.6. New Function Pointers

- PFN_xrVoidFunction

15.3.7. New Enums

- XrActionType
- XrCompositionLayerFlagBits
- XrEnvironmentBlendMode
- XrEyeVisibility
- XrFormFactor
- XrInputSourceLocalizedNameFlagBits
- XrInstanceCreateFlagBits
- XrObjectType
- XrReferenceSpaceType
- XrResult
- XrSessionCreateFlagBits
- XrSessionState
- XrSpaceLocationFlagBits
- XrSpaceVelocityFlagBits
- XrStructureType
- XrSwapchainCreateFlagBits
- XrSwapchainUsageFlagBits
- XrViewConfigurationType
- XrViewStateFlagBits

15.3.8. New Bitmasks

- XrCompositionLayerFlags

- XrInputSourceLocalizedNameFlags
- XrInstanceCreateFlags
- XrSessionCreateFlags
- XrSpaceLocationFlags
- XrSpaceVelocityFlags
- XrSwapchainCreateFlags
- XrSwapchainUsageFlags
- XrViewStateFlags

15.3.9. New Headers

- `openxr_platform_defines`

15.3.10. New Enum Constants

- `XR_FALSE`
- `XR_MAX_API_LAYER_DESCRIPTION_SIZE`
- `XR_MAX_API_LAYER_NAME_SIZE`
- `XR_MAX_APPLICATION_NAME_SIZE`
- `XR_MAX_ENGINE_NAME_SIZE`
- `XR_MAX_EXTENSION_NAME_SIZE`
- `XR_MAX_PATH_LENGTH`
- `XR_MAX_RESULT_STRING_SIZE`
- `XR_MAX_RUNTIME_NAME_SIZE`
- `XR_MAX_STRUCTURE_NAME_SIZE`
- `XR_MAX_SYSTEM_NAME_SIZE`
- `XR_TRUE`

Appendix

Code Style Conventions

These are the code style conventions used in this specification to define the API.

Conventions

- Enumerants and defines are all upper case with words separated by an underscore.
- Neither type, function or member names contain underscores.
- Structure members start with a lower case character and each consecutive word starts with a capital.
- A structure that has a pointer to an array includes a structure member named `fooCount` of type `uint32_t` to denote the number of elements in the array of `foo`.
- A structure that has a pointer to an array lists the `fooCount` member first and then the array pointer.
- Unless a negative value has a clearly defined meaning all `fooCount` variables are unsigned.
- Function parameters that are modified are always listed last.

Prefixes are used in the API to denote specific semantic meaning of names, or as a label to avoid name clashes, and are explained here:

Prefix	Description
`XR_`	Enumerants and defines are prefixed with these characters.
`Xr`	Non-function-pointer types are prefixed with these characters.
`xr`	Functions are prefixed with these characters.
`PFN_xr`	Function pointer types are prefixed with these characters.

Application Binary Interface

This section describes additional definitions and conventions that define the application binary interface.

Structure Types

```
// Provided by XR_VERSION_1_0

    XR_TYPE_GEOSPATIAL_TRACKER_ANCHOR_TRACKING_INFO_ANDROID = 1000797004,
  // Provided by XR_EXT_interaction_profile_battery_state_display
    XR_TYPE_BATTERY_STATE_DISPLAY_EXT = 1000836000,
  // Provided by XR_EXT_loader_init_properties
    XR_TYPE_LOADER_INIT_INFO_PROPERTIES_EXT = 1000838000,
  // Provided by XR_EXT_view_configuration_views_change
    XR_TYPE_EVENT_DATA_VIEW_CONFIGURATION_VIEWS_CHANGED_EXT = 1000839000,
  // Provided by XR_KHR_vulkan_enable2
    XR_TYPE_GRAPHICS_BINDING_VULKAN2_KHR = XR_TYPE_GRAPHICS_BINDING_VULKAN_KHR,
  // Provided by XR_KHR_vulkan_enable2
    XR_TYPE_SWAPCHAIN_IMAGE_VULKAN2_KHR = XR_TYPE_SWAPCHAIN_IMAGE_VULKAN_KHR,
  // Provided by XR_KHR_vulkan_enable2
    XR_TYPE_GRAPHICS_REQUIREMENTS_VULKAN2_KHR = XR_TYPE_GRAPHICS_REQUIREMENTS_VULKAN_KHR,
  // Provided by XR_FB_haptic_pcm
    XR_TYPE_DEVICE_PCM_SAMPLE_RATE_GET_INFO_FB = XR_TYPE_DEVICE_PCM_SAMPLE_RATE_STATE_FB,
  // Provided by XR_KHR_locate_spaces
    XR_TYPE_SPACES_LOCATE_INFO_KHR = XR_TYPE_SPACES_LOCATE_INFO,
  // Provided by XR_KHR_locate_spaces
    XR_TYPE_SPACE_LOCATIONS_KHR = XR_TYPE_SPACE_LOCATIONS,
  // Provided by XR_KHR_locate_spaces
    XR_TYPE_SPACE_VELOCITIES_KHR = XR_TYPE_SPACE_VELOCITIES,
    XR_STRUCTURE_TYPE_MAX_ENUM = 0x7FFFFFFF
} XrStructureType;
```

Most structures containing `type` members have a value of `type` matching the type of the structure, as described more fully in Valid Usage for Structure Types.

Note that all extension enums begin at the extension enum base of 10^9 (base 10). Each extension is assigned a block of 1000 enums, starting at the enum base and arranged by the extension's number.

```
// Provided by XR_VERSION_1_0
#define XR_EXTENSION_ENUM_BASE 1000000000
```

```
// Provided by XR_VERSION_1_0
#define XR_EXTENSION_ENUM_STRIDE 1000
```

For example, if extension number 5 wants to use an enum value of 3, the final enum is computed by:

enum = XR_EXTENSION_ENUM_BASE + (extension_number - 1) * XR_EXTENSION_ENUM_STRIDE + enum_value

1000004003 = 1000000000 + 4 * 1000 + 3

The maximum allowed enum value in an extension is 2,147,482,999, which belongs to extension number 1147483.

Flag Types

Flag types are all bitmasks aliasing the base type `XrFlags64` and with corresponding bit flag types defining the valid bits for that flag, as described in Valid Usage for Flags.

Flag types defined in the core specification were originally listed/defined here, but have been moved to be adjacent to their associated `FlagBits` type. See the Index for a list.

General Macro Definitions

This API is defined in C and uses "C" linkage. The `openxr.h` header file is opened with:

```
1 #ifdef __cplusplus
2 extern "C" {
3 #endif
```

and closed with:

```
1 #ifdef __cplusplus
2 }
3 #endif
```

The supplied `openxr.h` header defines a small number of C preprocessor macros that are described below.

Version Number Macros

Three version numbers are defined in `openxr.h`. Each is packed into a 64-bit integer as described in API Version Number Function-like Macros.

```
// Provided by XR_VERSION_1_0
// OpenXR current version number.
#define XR_CURRENT_API_VERSION XR_MAKE_VERSION(1, 1, 62)
```

XR_CURRENT_API_VERSION is the current version of the OpenXR API.

In many cases, XR_API_VERSION_1_0 or XR_API_VERSION_1_1 are preferred for source forward-compatibility.

```
// Provided by XR_VERSION_1_0
// OpenXR 1.0 version number
#define XR_API_VERSION_1_0 XR_MAKE_VERSION(1, 0,
XR_VERSION_PATCH(XR_CURRENT_API_VERSION))
```

XR_API_VERSION_1_0 is the version of the OpenXR 1.0 API. The "major" and "minor" components are always 1.0, while the "patch" component matches XR_CURRENT_API_VERSION.

```
// Provided by XR_VERSION_1_1
// OpenXR 1.1 version number
#define XR_API_VERSION_1_1 XR_MAKE_VERSION(1, 1,
XR_VERSION_PATCH(XR_CURRENT_API_VERSION))
```

XR_API_VERSION_1_1 is the version of the OpenXR 1.1 API. The "major" and "minor" components are always 1.1, while the "patch" component matches XR_CURRENT_API_VERSION.

API Version Number Function-like Macros

API Version Numbers are three components, packed into a single 64-bit integer. The following macros manipulate version components and packed version numbers.

```
// Provided by XR_VERSION_1_0
#define XR_MAKE_VERSION(major, minor, patch) \
    ((((major) & 0xffffULL) << 48) | (((minor) & 0xffffULL) << 32) | ((patch) &
0xffffffffULL))
```

Parameter Descriptions

- `major` is the major version number, packed into the most-significant 16 bits.
- `minor` is the minor version number, packed into the second-most-significant group of 16 bits.
- `patch` is the patch version number, in the least-significant 32 bits.

XR_MAKE_VERSION constructs a packed 64-bit integer API version number from three components. The format used is described in API Version Numbers and Semantics.

This macro **can** be used when constructing the XrApplicationInfo::`apiVersion` parameter passed to xrCreateInstance.

```
// Provided by XR_VERSION_1_0
#define XR_VERSION_MAJOR(version) (uint16_t)(((uint64_t)(version) >> 48)& 0xffffULL)
```

Parameter Descriptions

- `version` is a packed version number, such as those produced with XR_MAKE_VERSION.

XR_VERSION_MAJOR extracts the API major version number from a packed version number.

```
// Provided by XR_VERSION_1_0
#define XR_VERSION_MINOR(version) (uint16_t)(((uint64_t)(version) >> 32) & 0xffffULL)
```

Parameter Descriptions

- `version` is a packed version number, such as those produced with XR_MAKE_VERSION.

XR_VERSION_MINOR extracts the API minor version number from a packed version number.

```
// Provided by XR_VERSION_1_0
#define XR_VERSION_PATCH(version) (uint32_t)((uint64_t)(version) & 0xffffffffULL)
```

Parameter Descriptions

- `version` is a packed version number, such as those produced with XR_MAKE_VERSION.

XR_VERSION_PATCH extracts the API patch version number from a packed version number.

Handle and Atom Macros

```
// Provided by XR_VERSION_1_0
#if !defined(XR_DEFINE_HANDLE)
#if (XR_PTR_SIZE == 8)
    #define XR_DEFINE_HANDLE(object) typedef struct object##_T* object;
#else
    #define XR_DEFINE_HANDLE(object) typedef uint64_t object;
#endif
#endif
```

Parameter Descriptions

- object is the name of the resulting C type.

XR_DEFINE_HANDLE defines a handle type, which is an opaque 64 bit value, which **may** be implemented as an opaque, distinct pointer type on platforms with 64 bit pointers.

For further details, see Handles.

```
// Provided by XR_VERSION_1_0
#if !defined(XR_NULL_HANDLE)
#if (XR_PTR_SIZE == 8) && XR_CPP_NULLPTR_SUPPORTED
    #define XR_NULL_HANDLE nullptr
#else
    #define XR_NULL_HANDLE 0
#endif
#endif
```

XR_NULL_HANDLE is a reserved value representing a non-valid object handle. It **may** be passed to and returned from API functions only when specifically allowed.

```
// Provided by XR_VERSION_1_0
#if !defined(XR_DEFINE_ATOM)
    #define XR_DEFINE_ATOM(object) typedef uint64_t object;
#endif
```

Parameter Descriptions

- object is the name of the resulting C type.

XR_DEFINE_ATOM defines an atom type, which is an opaque 64 bit integer.

```
// Provided by XR_VERSION_1_0
#if !defined(XR_DEFINE_OPAQUE_64)
    #if (XR_PTR_SIZE == 8)
        #define XR_DEFINE_OPAQUE_64(object) typedef struct object##_T* object;
    #else
        #define XR_DEFINE_OPAQUE_64(object) typedef uint64_t object;
    #endif
#endif
```

Parameter Descriptions

- object is the name of the resulting C type.

XR_DEFINE_OPAQUE_64 defines an opaque 64 bit value, which **may** be implemented as an opaque, distinct pointer type on platforms with 64 bit pointers.

Platform-Specific Macro Definitions

Additional platform-specific macros and interfaces are defined using the included `openxr_platform.h` file. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platform implementations of the API.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

XRAPI_ATTR is a macro placed before the return type of an API function declaration. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

XRAPI_CALL is a macro placed after the return type of an API function declaration. This macro controls calling conventions for MSVC-style compilers.

XRAPI_PTR is a macro placed between the (and * in API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as XRAPI_ATTR or XRAPI_CALL, depending on the compiler.

Examples:

Function declaration:

```
XRAPI_ATTR <return_type> XRAPI_CALL <function_name>(<function_parameters>);
```

Function pointer type declaration:

```
typedef <return_type> (XRAPI_PTR *PFN_<function_name>)(<function_parameters>);
```

Platform-Specific Header Control

If the XR_NO_STDINT_H macro is defined by the application at compile time, before including any OpenXR header, extended integer types normally found in `<stdint.h>` and used by the OpenXR headers, such as `uint8_t`, **must** also be defined (as `typedef` or with the preprocessor) before including any OpenXR header. Otherwise, `openxr.h` and related headers will not compile. If XR_NO_STDINT_H is not defined, the system-provided `<stdint.h>` is used to define these types. There is a fallback path for Microsoft Visual Studio version 2008 and earlier versions (which lack this header) that is automatically activated as needed.

Graphics API Header Control

Compile Time Symbol	Graphics API Name
XR_USE_GRAPHICS_API_OPENGL	OpenGL
XR_USE_GRAPHICS_API_OPENGL_ES	OpenGL ES
XR_USE_GRAPHICS_API_VULKAN	Vulkan
XR_USE_GRAPHICS_API_D3D11	Direct3D 11
XR_USE_GRAPHICS_API_D3D12	Direct3D 12

Window System Header Control

Compile Time Symbol	Window System Name
XR_USE_PLATFORM_WIN32	Microsoft Windows
XR_USE_PLATFORM_XLIB	X Window System Xlib
XR_USE_PLATFORM_XCB	X Window System XCB
XR_USE_PLATFORM_EGL	EGL (for OpenGL/OpenGL ES usage on any platform with EGL support)
XR_USE_PLATFORM_WAYLAND	Wayland (deprecated)
XR_USE_PLATFORM_ANDROID	Android Native

Wayland Notes

The Wayland part of `XR_KHR_opengl_enable` was never implemented by any runtime, and it was determined that as written the Wayland integration would not work well without making unsafe assumptions. It was decided to deprecate these parts. A future extension would be needed to provide functionality for a Wayland integration.

Android Notes

Android specific notes for using the OpenXR specification.

Android Runtime category tag for immersive mode selection

Android applications should add the `<category android:name="org.khronos.openxr.intent.category.IMMERSIVE_HMD" />` tag inside the intent-filter to indicate that the activity starts in an immersive OpenXR mode and will not touch the native Android 2D surface.

The HMD suffix indicates the preferred form-factor used by the application and can be used by launchers to filter applications listed.

For example:

```
<intent-filter>
   <action android:name="android.intent.action.MAIN" />
   <category android:name="android.intent.category.LAUNCHER" />
   <category android:name="org.khronos.openxr.intent.category.IMMERSIVE_HMD" />
</intent-filter>
```

Glossary

The terms defined in this section are used throughout this Specification. Capitalization is not significant for these definitions.

Term	Description
Application	The XR application which calls the OpenXR API to communicate with an OpenXR runtime.

Term	Description
Deprecated	A feature/extension is deprecated if it is no longer recommended as the correct or best way to achieve its intended purpose. Generally a newer feature/extension will have been created that solves the same problem - in cases where no newer alternative feature exists, justification should be provided.
Handle	An opaque integer or pointer value used to refer to an object. Each object type has a unique handle type.
Haptic	Haptic or kinesthetic communication recreates the sense of touch by applying forces, vibrations, or motions to the user.
In-Process	Something that executes in the application's process.
Instance	The top-level object, which represents the application's connection to the runtime. Represented by an XrInstance object.
Normalized	A value that is interpreted as being in the range [0,1], or a vector whose norm is in that range, as a result of being implicitly divided or scaled by some other value.
Out-Of-Process	Something that executes outside the application's process.
Promoted	A feature is promoted if it is taken from an older extension and made available as part of a new core version of the API, or a newer extension that is considered to be either as widely supported or more so. A promoted feature may have minor differences from the original such as: • It may be renamed • A small number of non-intrusive parameters may have been added • The feature may be advertised differently by device features • The author ID suffixes will be changed or removed as appropriate

Term	Description
Provisional	A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.
Required Extensions	Extensions that must be enabled alongside extensions dependent on them, or that must be enabled to use given hardware.
Runtime	The software which implements the OpenXR API and allows applications to interact with XR hardware.
Swapchain	A resource that represents a chain of images in device memory. Represented by an XrSwapchain object.
Swapchain Image	Each element in a swapchain. Commonly these are simple formatted 2D images, but in other cases they may be array images. Represented by a structure related to XrSwapchainImageBaseHeader.

Abbreviations

Abbreviations and acronyms are sometimes used in the API where they are considered clear and commonplace, and are defined here:

Abbreviation	Description
API	Application Programming Interface
AR	Augmented Reality
ER	Eye Relief
IAD	Inter Axial Distance
IPD	Inter Pupillary Distance
MR	Mixed Reality
OS	Operating System
TSG	Technical Sub-Group. A specialized sub-group within a Khronos Working Group (WG).
VR	Virtual Reality

Abbreviation	Description
WG	Working Group. An organized group of people working to define/augment an API.
XR	VR + AR + MR

Dedication (Informative)

In memory of Johannes van Waveren: a loving father, husband, son, brother, colleague, and dear friend.

Johannes, known to his friends as "JP", had a great sense of humor, fierce loyalty, intense drive, a love of rainbow unicorns, and deep disdain for processed American cheese. Perhaps most distinguishing of all, though, was his love of technology and his extraordinary technical ability.

JP's love of technology started at an early age --- instead of working on his homework, he built train sets, hovercrafts, and complex erector sets from scratch; fashioned a tool for grabbing loose change out of street grates; and played computer games. The passion for computer games continued at Delft University of Technology, where, armed with a T1 internet connection and sheer talent, he regularly destroyed his foes in arena matches without being seen, earning him the moniker "MrElusive". During this time, he wrote the Gladiator-bot AI, which earned him acclaim in the community and led directly to a job at the iconic American computer game company, id Software. From there, he quickly became an expert in every system he touched, contributing significantly to every facet of the technology: AI, path navigation, networking, skeletal animation, virtual texturing, advanced rendering, and physics. He became a master of all. He famously owned more lines of code than anyone else, but he was also a generous mentor, helping junior developers hone their skills and make their own contributions.

When the chance to work in the VR industry arose, he saw it as an opportunity to help shape the future. Having never worked on VR hardware did not phase him; he quickly became a top expert in the field. Many of his contributions directly moved the industry forward, most recently his work on asynchronous timewarp and open-standards development.

Time was not on his side. Even in his final days, JP worked tirelessly on the initial proposal for this specification. The treatments he had undergone took a tremendous physical toll, but he continued to work because of his love of technology, his dedication to the craft, and his desire to get OpenXR started on a solid footing. His focus was unwavering.

His proposal was unofficially adopted several days before his passing - and upon hearing, he mustered the energy for a smile. While it was his great dream to see this process through, he would be proud of the spirit of cooperation, passion, and dedication of the industry peers who took up the torch to drive this specification to completion.

JP lived a life full of accomplishment, as evidenced by many publications, credits, awards, and nominations where you will find his name. A less obvious accomplishment --- but of equal importance --- is the influence he had on people through his passionate leadership. He strove for excellence in everything that he did. He was always excited to talk about technology and share the discoveries made while working through complex problems. He created excitement and interest around engineering and technical excellence. He was a mentor and teacher who inspired those who knew him and many continue to benefit from his hard work and generosity.

JP was a rare gem; fantastically brilliant intellectually, but also warm, compassionate, generous, humble, and funny. Those of us lucky enough to have crossed paths with him knew what a privilege and great honor it was to know him. He is certainly missed.

Contributors (Informative)

OpenXR is the result of contributions from many people and companies participating in the Khronos OpenXR Working Group. Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed below.

Working Group Contributors to OpenXR

- Adam Gousetis, Google (version 1.0)
- Alain Zanchetta, Microsoft (version 1.1)
- Alex Turner, Microsoft (versions 1.0, 1.1)
- Alex Sink, HTC (version 1.1)
- Alfredo Muniz, XEED (version 1.1) (Working Group Chair)
- Andreas Loeve Selvik, Meta Platforms (versions 1.0, 1.1)
- Andres Rodriguez, Valve Software (version 1.0)
- Armelle Laine, Qualcomm Technologies (version 1.0)
- Attila Maczak, CTRL-labs (version 1.0)
- David Fields, Microsoft (version 1.1)
- Baolin Fu, ByteDance (version 1.1)
- Blake Taylor, Magic Leap (version 1.0)
- Brad Grantham, Google (version 1.0)
- Brandon Jones, Google (version 1.0)
- Brent E. Insko, Intel (version 1.0) (former Working Group Chair)
- Brent Wilson, Microsoft (version 1.0)
- Bryce Hutchings, Microsoft (versions 1.0, 1.1)
- Cass Everitt, Meta Platforms (versions 1.0, 1.1)
- Charles Egenbacher, Epic Games (version 1.0)
- Charlton Rodda, Collabora (version 1.1)
- Chris Kuo, HTC (version 1.1)
- Chris Osborn, CTRL-labs (version 1.0)
- Christine Perey, Perey Research & Consulting (version 1.0)
- Christoph Haag, Collabora (version 1.0, 1.1)
- Christopher Fiala, Epic Games (version 1.1)
- Craig Donner, Google (version 1.0)

- Dan Ginsburg, Valve Software (version 1.0)
- Dave Houlton, LunarG (version 1.0)
- Dave Shreiner, Unity Technologies (version 1.0)
- Darryl Gough, Microsoft (version 1.1)
- Denny Rönngren, Varjo (versions 1.0, 1.1)
- Dmitriy Vasilev, Samsung Electronics (version 1.0)
- Doug Twileager, ZSpace (version 1.0)
- Ed Hutchins, Meta Platforms (version 1.0)
- Eryk Pecyna, Meta Platforms (version 1.1)
- Frederic Plourde, Collabora (version 1.1)
- Gloria Kennickell, Meta Platforms (version 1.0)
- Gregory Greeby, AMD (version 1.0)
- Guodong Chen, Huawei (version 1.0)
- Jack Pritz, Unity Technologies (versions 1.0, 1.1)
- Jakob Bornecrantz, Collabora (versions 1.0, 1.1)
- Jared Cheshier, PlutoVR (versions 1.0, 1.1)
- Jared Finder, Google (version 1.1)
- Javier Martinez, Intel (version 1.0)
- Jeff Bellinghausen, Valve Software (version 1.0)
- Jiehua Guo, Huawei (version 1.0)
- Joe Ludwig, Valve Software (versions 1.0, 1.1)
- John Kearney, Meta Platforms (version 1.1)
- Johannes van Waveren, Meta Platforms (version 1.0)
- Jon Leech, Khronos (version 1.0)
- Jonas Pegerfalk, Tobii (version 1.1)
- Jonathan Wright, Meta Platforms (versions 1.0, 1.1)
- Juan Wee, Samsung Electronics (version 1.0)
- Jules Blok, Epic Games (version 1.0)
- Jun Yan, ByteDance (version 1.1)
- Karl Schultz, LunarG (version 1.0)
- Karthik Kadappan, Magic Leap (version 1.1)
- Karthik Nagarajan, Qualcomm Technologies (version 1.1)

- Kaye Mason, Google (version 1.0)
- Krzysztof Kosiński, Google (version 1.0)
- Kyle Chen, HTC (version 1.1)
- Lachlan Ford, Google (versions 1.0, 1.1)
- Lubosz Sarnecki, Collabora (version 1.0)
- Mark Young, LunarG (version 1.0)
- Martin Renschler, Qualcomm Technologies (version 1.0)
- Matias Koskela, Tampere University of Technology (version 1.0)
- Matt Wash, Arm (version 1.0)
- Mattias Brand, Tobii (version 1.0)
- Mattias O. Karlsson, Tobii (version 1.0)
- Michael Gatson, Dell (version 1.0)
- Minmin Gong, Microsoft (version 1.0)
- Mitch Singer, AMD (version 1.0)
- Nathan Nuber, Valve (version 1.1)
- Nell Waliczek, Microsoft (version 1.0)
- Nick Whiting, Epic Games (version 1.0) (former Working Group Chair)
- Nigel Williams, Sony (version 1.0)
- Nihav Jain, Google, Inc (version 1.1)
- Paul Pedriana, Meta Platforms (version 1.0)
- Paulo Gomes, Samsung Electronics (version 1.0)
- Peter Kuhn, Unity Technologies (versions 1.0, 1.1)
- Peter Peterson, HP Inc (version 1.0)
- Philippe Harscoet, Samsung Electronics (versions 1.0, 1.1)
- Pierre-Loup Griffais, Valve Software (version 1.0)
- Rafael Wiltz, Magic Leap (version 1.1)
- Rajeev Gupta, Sony (version 1.0)
- Remi Arnaud, Starbreeze (version 1.0)
- Remy Zimmerman, Logitech (version 1.0)
- Ria Hsu, HTC (version 1.1)
- River Gillis, Google (version 1.0)
- Robert Blenkinsopp, Ultraleap (version 1.1)

- Robert Memmott, Meta Platforms (version 1.0)
- Robert Menzel, NVIDIA (version 1.0)
- Robert Simpson, Qualcomm Technologies (version 1.0)
- Robin Bourianes, Starbreeze (version 1.0)
- Ron Bessems, Magic Leap (version 1.1) (Working Group Vice-Chair)
- Rune Berg, independent (version 1.1)
- Rylie Pavlik, Collabora (versions 1.0, 1.1) (Spec Editor)
- Ryan Vance, Epic Games (version 1.0)
- Sam Martin, Arm (version 1.0)
- Satish Salian, NVIDIA (version 1.0)
- Scott Flynn, Unity Technologies (version 1.0)
- Shanliang Xu, ByteDance (version 1.1)
- Sean Payne, CTRL-labs (version 1.0)
- Sophia Baldonado, PlutoVR (version 1.0)
- Steve Smith, Epic Games (version 1.0)
- Sungye Kim, Intel (version 1.0)
- Tom Flynn, Samsung Electronics (version 1.0)
- Trevor F. Smith, Mozilla (version 1.0)
- Victor Brodin, Epic Games (version 1.1)
- Vivek Viswanathan, Dell (version 1.0)
- Wenlin Mao, Meta Platforms (version 1.1)
- Xiang Wei, Meta Platforms (version 1.1)
- Yin Li, Microsoft (versions 1.0, 1.1)
- Yuval Boger, Sensics (version 1.0)
- Zhanrui Jia, ByteDance (version 1.1)
- Zheng Qin, Microsoft (version 1.0)
